THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXII.—No. 4397. MAY 13, 1927.

BUILDINGS IN FRANCE AND BELGIUM

NOTABLE instances of rebuilding in devastated regions of France, to consider only a few examples such as are represented by the great new church at Bethune and its "Grand Place," reveal much that is instructive to the beholder, without further multiplying nces. We see in these examples a change both of outlook emper. The old quiet, more reserved ways are gone, and t building is marked by the haste for results. There is thing aggressive and declamatory in its ambitions, anxious ll attention to itself.

very noticeable thing about the building of the new church nich we refer, is the want of connection between the grades orkers. There is a lack of co-ordination which prevents close relationship, and it is as though the architect had ed out his instructions in watertight compartments, ating the different needs. We see him careful over his work, and the laying of his stone, while wholly indifferent e need of an even greater care in the higher grades of workhip. And this is no conscious neglect on his part, but the l outcome of the influences affecting architecture. When nes to window design and traceries, to carved screen work, as that surrounding the choir, this want of any united th between the parts, discloses itself more and more. So letely has the freedom of craftsmanship been supplanted echanical and industrial values in this building, that we hem applied here in all those directions which once gave and significance to mediæval labour, with the result that, ted of all thought or feeling, it is of a stock pattern and of eeblest execution.

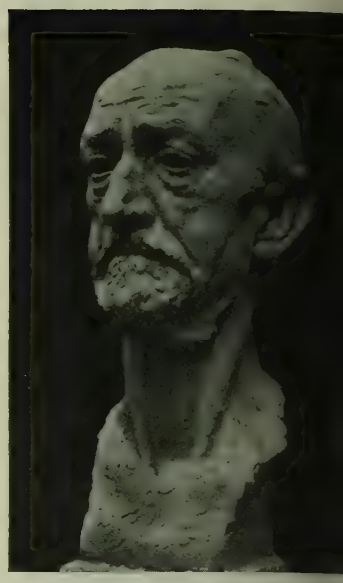
w far they react on each other may not be easy to define, he methods of mass production when applied to architecseem to control it within its own limits. Held by these s, the factor that dominates is time! And a governing n for the state of things, of which this great church is an ple, is that it has been completed far too quickly. We get pretence of completion because real completion in such mstances is impossible. It is a case—though no doubt nsciously—of the industrial aim dominating the architec. Architecture is in bad company, and has become sed within this lower environment. This is not to say the building is without qualities. The great tower has a ive and graceful dignity, and we could wish that the rved blocks of stone for the decoration of the western ls, impressive in their baldness as they remain to-day, l be left until such changes of outlook have given us back hought and feeling that can alone justify their completion. we shall not remain at this present level, expressing only meral needs, which return to us so little of ourselves, but recapture the thought and feeling which, translated into rials, will give them new significance.

t was curious to notice in the work of the masons employed survival of the old sound methods of craftsmanship in the ng on the stonework in the interior, which was all being uted *in situ*, the old, good practice still lingering long the life has passed out of it; the actual quality of the being such that it is a matter of sheer indifference where done, and it were better not done at all.

We have to be careful, however, of forming general conclu from particular examples; yet it would be fair to say that conflicting issues, of the relationship of the methods of strialism to architecture and the arts, is an almost para nt consideration to-day. Survivals of ecclesiastical tradi drag themselves through this church, meaningless altogether, the design of the windows and elsewhere. Here the mind e architect, directed horizontally, flounders into curves as we see in these windows, as though, thinking in steel and iron, his mind was divided between the mediæval and the mechanical. This conflict results in windows which, in design and proportion, are really frightful. Square-headed they had challenged criticism far less than in this chaotic metamorphosis.

The "Grand Place" of Bethune in its rebuilding also presents this confusion and caricature resulting from the *mésalliance* between the past of building and modern influences. There is something aggressive about most of the architecture of the Grand Place, anxious to call attention to itself, as though it were a sort of advertisement. The modernism of the new "Place" divides itself between survivals of tradition expressed in sheer caricature, and the sort of thing we associate with the more flamboyant features of the exhibition of the "Arts Decoratif" in Paris, 1925. And yet it is all well intended, and it would be ungracious not to recognise the public spirit and desire to make good the losses of the war, or the real effort that has gone to it all.

When we look deeper for the causes of this more restless, ephemeral modern spirit, it appears as the haste for results, the want of composure and reflection on the true values of life reacting on production. Time is far from being the only element which we misuse, but is none the less one very important, and our haste for results to-day lacks the confidence and appreciation of the larger issues of life concerned with building, which would lead us to care more for them. Yet we must feel sympathy in understanding the difficulties and for the instability and unrest which is so largely the cause. But the reasons which make us the servants of this haste are mostly imaginary. We do not respect time, though we have all the time there is, and we do not save time but squander it, when from this haste we do our work badly.

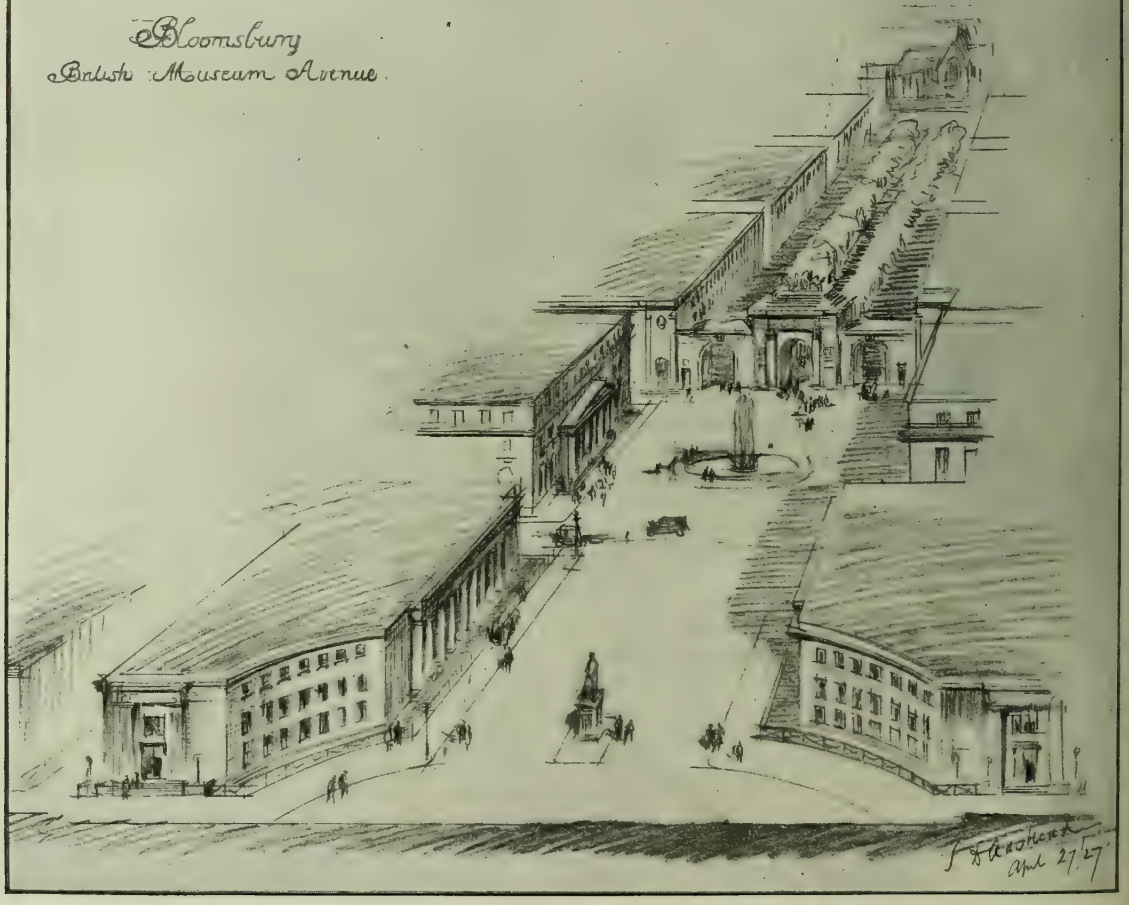


Some observation of building in districts of Belgium leaves a more favourable impression. Though apparent enough, the modernism is not so aggressive. There is more restraint, even without any recapture of the old spirit. The same lack of freedom for craftsmanship in building is seen, owing to its government industrially, without contact between the different workers. But those who look for technical explanations will be at a loss to discover the true reasons, which lie much more in the government and direction of life itself, anchored to no haven of permanent beliefs. There are to be seen in Belgium examples of factory building in which more co-ordination of aim within its limited scope is to be found. And it is better, that it carries within it no survivals, the construction being governed by the purpose and admitting of no departure from it. For this reason it is far more vital than new ecclesiastical building, which, except where it partakes of frankly industrial character, as in one or two new concrete churches, is neither one thing nor the other, and therefore without the force of reality to guide it. We build our beliefs, and an industrial age in building itself is on the way to better things. Nor shall we remain at this level of production. If we are asked in what direction to look for this re-kindling of thought and feeling, it is in better leadership.

For there is advantage in the utilitarian outlook of industrialism, that it does possess a reality, however inimical to the best things. We deceive ourselves in thinking to retain the past of architecture. It is over and has to be born again. Its further development will emerge more as the transition from industrialism to a better ordering of life—of which there are signs already—than in any attachments to the dead past. In this sense a new epoch opens in which there is much to hope for, much that is now being born. And such changes may come quickly, for, as has been truly said, if we look for our credentials we shall find them on the road.

NOTES

So Early in the Morning. We take the following interesting statement from a daily paper and we give publicity to it with some hesitation, finding the facts a severe test of our credulity. Truth is sometimes stranger than fiction, and the action of the Liverpool Cenotaph Committee is almost incredible, following as it does the reasonable request that the model that was to be erected in front of St. George's Hall for the guidance of the architect should be left for a month or two in order that the public might have an opportunity of forming a judgment on the questions at issue. "To enable the committee," we are told, "charged with the construction of the Liverpool Cenotaph to see how it will appear against the fine portico of Corinthian columns, 60 ft. high, of St. George's Hall, Liverpool, a model of the cenotaph was secretly constructed early yesterday (Sunday) morning. Lorries bearing parts of the model arrived at St. George's Plateau about 3 a.m., and it was erected in about two hours. At 5 a.m., when the sun had risen, giving a clear light over the building, Mr. Lionel Budden, the architect, accompanied by Professor Reilly, of Liverpool University; Sir Archibald Salvidge, chairman of the Cenotaph Committee; and members of the committee arrived and inspected the model cenotaph, taking care to see its effect on the front of St. George's Hall in view of the opposition of some architects and others, who have argued that this is not a suitable site. When the inspection was over the workmen quickly put the model back in the lorries, and it was taken away before many people were about."



The Cenotaph Committee and Public Opinion. Many appropriate comments will no doubt be made on the action of the Cenotaph Committee, and we shall be surprised if the apparent indifference of the Committee to public opinion will help them in the long run. The general public are notoriously apathetic on many questions which should have a deep interest for them, but though they are unfortunately far too frequently indifferent to the appeals which are made for the preservation of beautiful objects in their midst, they have a shrewd sense in deciding on the merits of a case when the facts are put to them with impartiality on the one hand and are withheld on the other, and we shall not be surprised if this matutinal adventure of the Cenotaph Committee and the hurried removal of all signs of their work is not interpreted as a very real fear of public opinion which they are attem to ignore. In this connection it m of interest to add that a Liverpool understands that as a result of the study given to the model from all a "the plans will be amended, probab

considerable extent." But if the public rectly or indirectly pay for this model ould they not have had an opportunity inspecting it—even so early in the rning?

New Housing Construction. We must accept the findings of a careful inquiry by an expert correspondent of the *Times* on the new methods of housing as a definite bute to the value of steel buildings. e inquiry has been conducted under ree heads—(1) Buildings of Steel, Other Metal Buildings, (3) Concrete ildings. In face of the elicited facts the position to the steel cottage is to some tent met. The summary of their adntages includes perfect dryness from the st, warmth in winter and coolness in mmer, economy of time in production d moderation in cost. As to the Weir uses the result of the *Times* inquiry is quoted. "The Weir houses have more an fulfilled expectations. The occuants are delighted with them, the authoies who ordered them are satisfied, and e men engaged in building them, who re otherwise unemployed, are well ntent with the conditions of work. ith thousands of working-class families Glasgow and elsewhere crying for cent homes a heavy responsibility rests those who stand in the way of supply- their needs." With regard to iron uses the inquiry results in very favourle consideration. The same may be d in effect as to the various forms of ncrete houses. That the writer has ly had a partial knowledge of all the w types of houses being designed and cted, was perhaps only to be expected, t the result of this careful inquiry does ow clearly enough that some valuable terprise has been expended and deands most careful consideration. We ust not confound the merely economic lue of materials and construction with e details of plan, design and fitments, improved quality in these matters ould be common to all methods. ither can we ignore the fact that most of the methods of working with standard sizes is more or less a difficulty in getting the best results in quality and nice architectural proportions and individuality.

Education by Film. A correspondent of the *Observer* describes some of the views of Mr. W. O. Brigstocke, of Liverpool University, on this subject. He suggests that the film might be made a powerful instrument for teaching in a palatable and easily understood way. The versatile Felix might, it is proposed, be made the medium for instruction in mathematics and architecture. By letting him fall freely from a height, it could be made clear how, by ironing out a gravitational field in one place you only intensify it elsewhere. The teacher-artist could, Mr. Brigstocke believes, utilise the same creature to illustrate building construction; he would be shown as an arch, thrusting with his paws, or giving way at the hips. The modern tendency to combine instruction with a modicum of amusement must be all to the good, for it holds the attention where the older dry-as-dust method failed. We hope that something may come of Mr. Brigstocke's original ideas, more especially in regard to architectural teaching.

Canberra. The opening of a brand new capital to a great country can hardly fail to awaken the imagination, and especially the imagination of the architect, to whom such opportunities come but seldom. It may be doubted whether it is humanly possible to produce in a new city any trace of that atmosphere of humanity that seems to be in the air of an old town. For many years a new city must retain something of the exhibition feeling where the spirit of past association can find no place. But what is lost in tradition can be more than compensated in harmony, beauty, convenience, and health, and Canberra should become one of the most interesting of the world's cities to visit.

A Suffolk Font Cover. We reproduce on page 763 a photograph of the font cover at St. Mary's Church, Hadleigh, in Suffolk. The font itself is the work of the 14th century, restored, alas! because the fanatics in the 17th century broke away the figure sculpture. The cover is a memorial to John Overall, who was born in Hadleigh of poor parents, won a scholarship at Wolsey's School in Ipswich, and another at Cambridge, became Dean of St. Pauls, London, Bishop of Litchfield, and was translated to Norwich. He was one of the translators of the Bible in the reign of James I, and the author, or compiler, of the Sacramental part of the Church Catechism.

A Tribute of Sympathy. Our readers will, we are sure, be associated with us in an expression of sincere sympathy with Mr. G. Topham Forrest, Superintending Architect to the L.C.C., in the loss of his wife, whose pleasing personality was known to many of us.

Royal Academy Exhibition, 1927.

Mr. Hermon Cawthra, Sculptor.

GENERAL NEWS

Professional Announcement.

Gateshead Town Council has accepted the resignation of Mr. N. P. Pattinson, Borough Surveyor, who retires at the end of July. He began his business career with Armour and Paynter, engineers and surveyors, who had offices in West Street, Gateshead, and in 1890 joined the Gateshead Corporation as deputy to the late Mr. Bower, borough surveyor, succeeding the latter gentleman in 1904.

Obituary.

We much regret to record the death of Mr. G. H. Fellowes Prynne, F.R.I.B.A. We shall publish an obituary notice in our next issue.

The Foundling Hospital.

The announcement is made by Messrs. Knight, Frank and Rutley, of Hanover-square, that they have been instructed by the owners of the Foundling Estate to dispose of the site of the Foundling Hospital with the buildings, comprising about nine acres of freehold land. While there are no restrictions laid down as to the future of this important Central London property, it is to be expected that the vendors will take care that no scheme goes forward which will detract from the value of the surrounding 47 acres, which they also hold.

The Bridges Delay.

At the County Hall, Mr. W. Ray, the leader of the Municipal Reform Party on the Council, and Sir Percy Simmons, chairman of the Improvements Committee, have declared that the next move with regard to the Royal Commission's Report on Cross River Traffic is with the Government. "We are," they said, "ready and willing to go on with the reconstruction of Waterloo Bridge in accordance with the recommendations of the Royal Commission directly we know that there is to be a Charing Cross bridge. We are ready to lay before the expert committee to be appointed all the information we have collected. But the Government has not yet appointed its experts, and we are still waiting. The council is in no way responsible for delay."

New Memorial Library, Oscott College, Birmingham.

As a memorial to the late Bishop, Oscott College is erecting a magnificent new library to house the very valuable books which form the Oscott collection. The building is to be erected in sand stock facing bricks, with stone dressings, and will be in Gothic style, in keeping with the existing buildings. The architect responsible for the work is Mr. E. Bower Norris, F.R.I.B.A., of Messrs. Sandy and Norris, and the contractors are Messrs. W. B. and T. F. Archer, of Handsworth, Birmingham. It is expected that the building will be ready for occupation in about nine months.

Architect's Bequests.

Mr. Delissa Joseph, F.R.I.B.A., of Basinghall Avenue, E.C., and Cornwall Mansions, Kensington Court, W., who died on January 10, aged 68, leaving estate of the gross value of £32,606, with net personalty £25,925, left: £25 and £200 a year to his assistant, Daniel Warry; and £25 and £100 a year to his assistant, Percy Thompson. On the death of his wife one-half of the residue as she may appoint and subject thereto as to one moiety to the Royal Institute of British Architects, for a Bursary to enable a student or students who have passed the qualifying examination to visit the United States of America for the study of architecture; and the remaining moiety to Jews' College, to assist in the maintenance of the best students.

Bradford New Infirmary.

Mr. Eric Morley, F.R.I.B.A., F.S.I., has now prepared plans for the new infirmary which it is proposed to erect in Bradford at the cost of £500,000. In the new infirmary there will be a three-story administration block, four three-story ward blocks, and a theatre block two stories in height. There will be an accident and minor emergency department, a casualty department, massage and X-ray departments, a pathological block, and a mortuary with a small chapel adjoining, an isolation block, boiler house, laundry and workshops. There has been reserved in different parts of the site space for additional buildings, either ward blocks or other hospital accommodation, as well as space for new departments should the necessity arise. A new departure will be the provision in the scheme of a block to provide about seventy beds for private patients. It is proposed to proceed immediately with the building of this block, which will cost approximately £75,000, as it will be entirely self-contained.

COMPETITION NEWS

Houses, Ross.

Architects are invited to submit schemes for the building of forty non-parlour type and ten parlour type houses under the 1924 Housing Act, on sites to be selected. A sum of twenty guineas will be paid to the architect whose scheme is selected. Schemes endorsed "Housing Scheme" are to be submitted on or before noon on Monday, May 30th, to Mr. Ernest R. Davies, Clerk, Council Chambers, Ross.

Merthyr Vale War Memorial Competition.

The following notice has been issued by the R.I.B.A.:—

"The Competitions Committee desire to call the attention of members to the fact that the conditions of the above competition are not in accordance with the regulations of the R.I.B.A. The Competitions Committee are in negotiation with the promoters in the hope of securing an amendment. In the meantime members are advised to take no part in the competition."

Leith Town Hall and Library.

Forty-one designs have been sent in for this competition. They are at present being adjudicated upon by Sir George Washington Browne, president of the Royal Scottish Academy, the Corporation's assessor.

League of Nations' Headquarters, Geneva.

The International Jury of Architects which, for the past six weeks, has been examining the thousands of designs submitted in the world's competition for the construction of a new headquarters for the Secretariat and Assembly of the League of Nations gave its decision last Thursday week. The Jury declares that though the competition has produced an extraordinary wealth of valuable suggestions and many original designs, the results do not justify the recommendation that any of the designs submitted should be carried out. Many of the competitors did not adhere sufficiently closely to the conditions laid down in the rules, and the work of the Jury was consequently made very difficult. The Jury considers that the fundamental differences in the entrants' conception of the scheme is due to the transitional phase through which architecture is passing.

In the absence of a suitable design the Jury has divided the prize money of 165,000 Swiss francs into nine prizes of 12,000 Swiss francs (£480) and a number of honourable mentions of less monetary value. No British architect has received a prize, though it is understood that some hundreds of designs were received from Great Britain. The nine best designs were submitted by the following:—Carlo Broggi, Giuseppe Vaccaro, and Luigi Franzi (Rome); Nils Einar Eriksson (Stockholm); Camille Lefèvre (Paris); M. Corbusier and P. Jeanneret (Paris); Erick Zuputlitz, Rudolf Klophaus and August Scheck (Hamburg); Georges Labro (Paris); Professor Emil Fahrenkamp and Albert Beneke (Düsseldorf); Julien Flegenheimer (Geneva) and H. P. Henot (Paris); Giuseppe Vago (Rome).

The next step in regard to the new headquarters for the League rests with the General Assembly in September.

Royal Academy Exhibition, 1927.

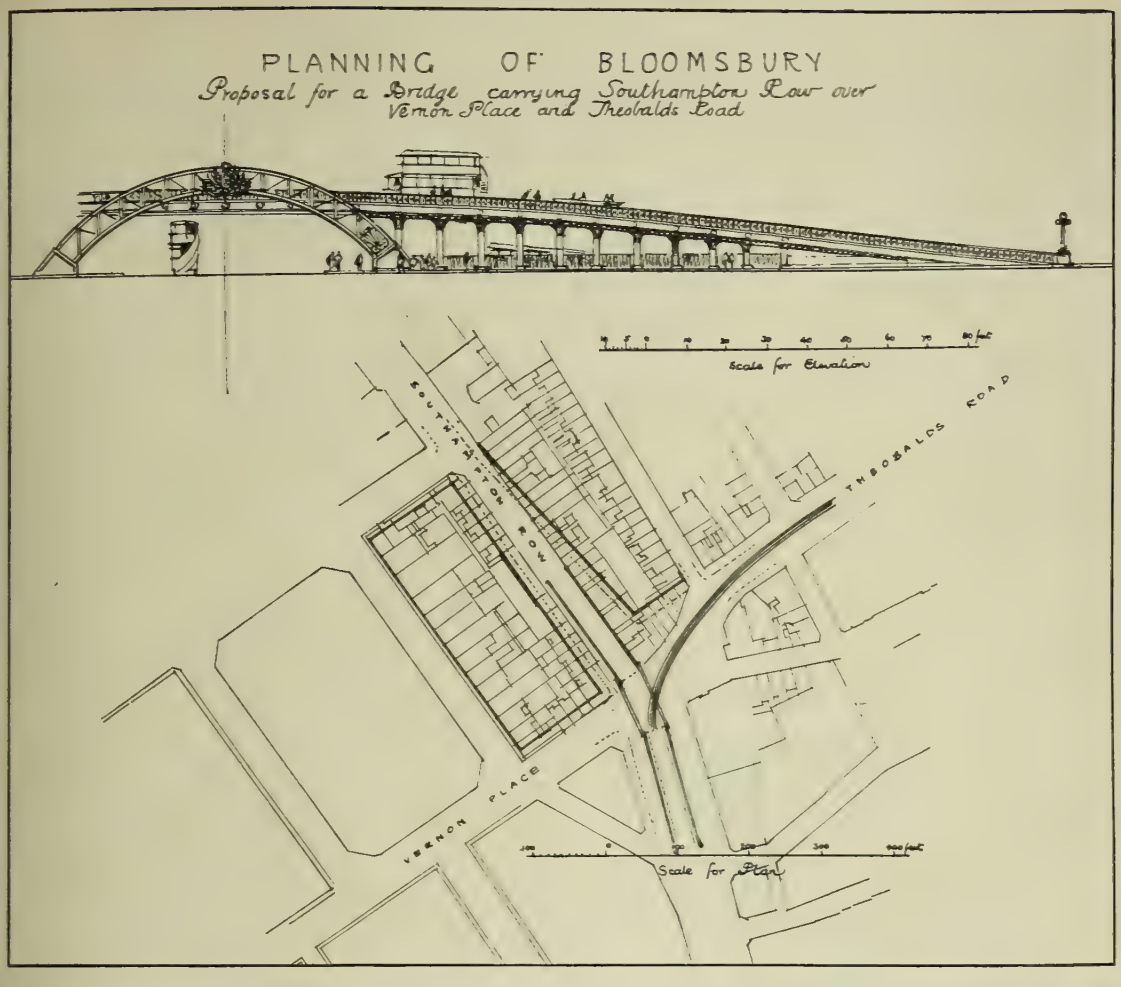
THE TOWN-PLANNING INSTITUTE

RE-PLANNING BLOOMSBURY

Mr. W. R. Davidge (President) took the chair on April 29 at Caxton Hall, Westminster, at an ordinary meeting of the Institute, when Professor S. D. Adshead read a paper on "Re-planning Bloomsbury." Having given an historical sketch of the area, the speaker said that Bloomsbury, like the rest of England, was to-day in the throes of a traffic problem, and its interests were not only affected by changes in the conditions of local traffic, but also increasingly involved in questions of redistribution that affected London as a whole. Considering the problem in its relation to London as a whole, with the map of London before us, perhaps the most striking feature was the rapidly increasing importance of Southampton-row. An older thoroughfare running north and south, and bounding Bloomsbury on the west, was Tottenham Court-road. North and south, the area was roughly bounded by the Euston-road and New Oxford-street, and in this parallelogram they had two buildings of great importance—University College and the British Museum. There were no direct thoroughfares crossing the area from south-west to north-east, nor from south-east to north-west, and traffic passing in these directions threaded its way with numerous right-angle turnings as in the chessboard plan.



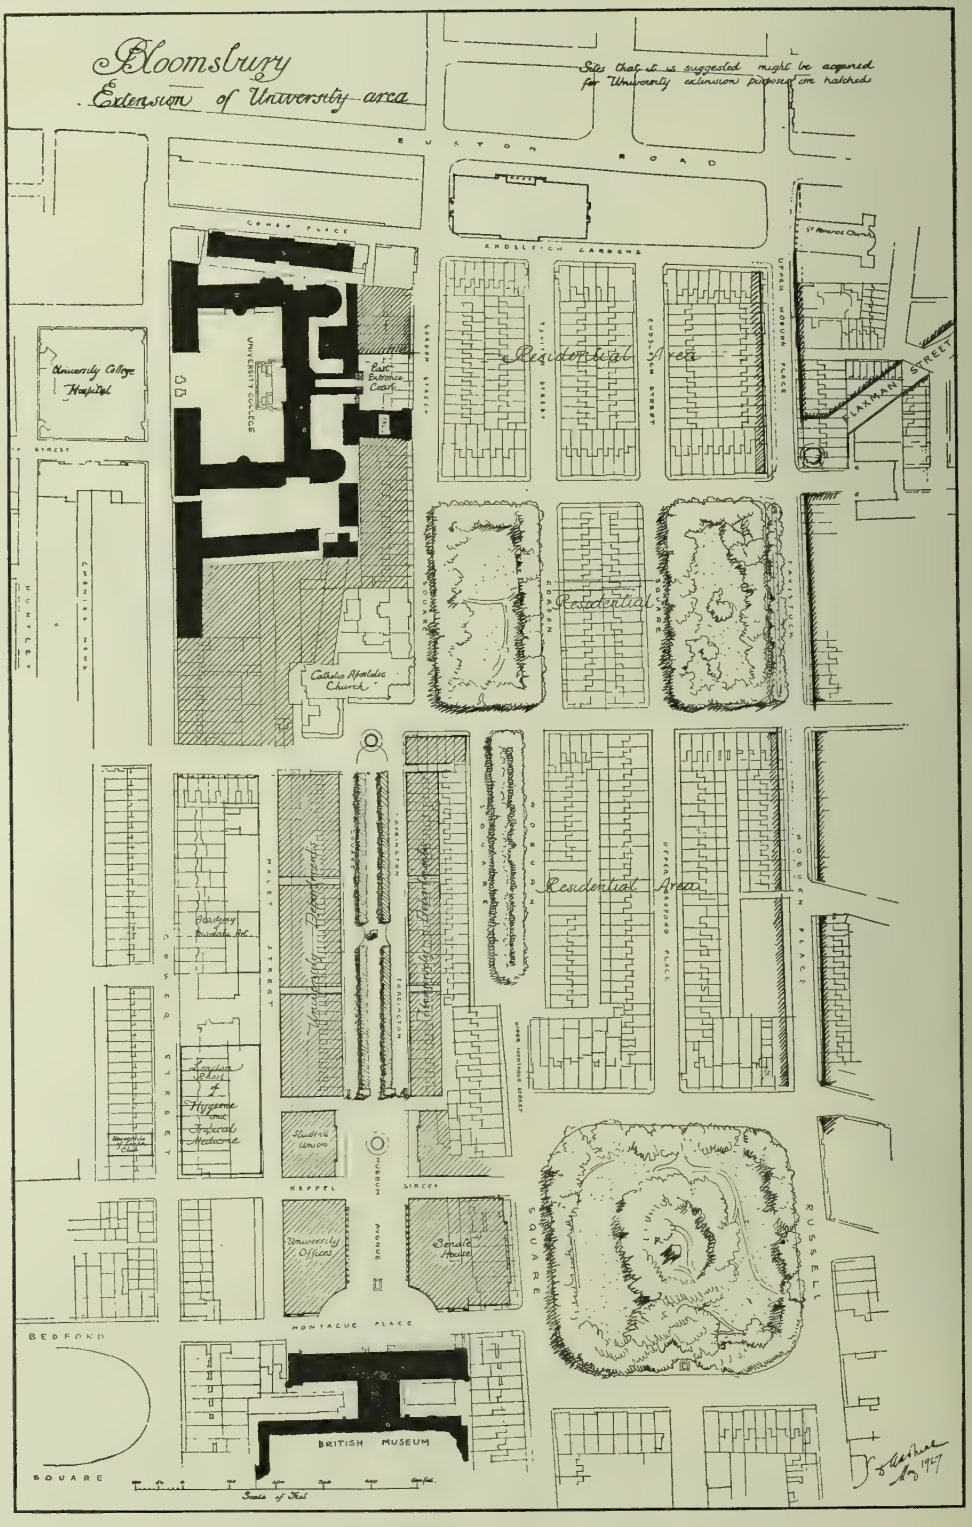
Again, scrutinising the traffic problem, it was safe to say that there was no necessity for the construction of any new north and south artery through the centre of the area, but the same could hardly be said in regard to the construction of a direct route across the centre in an easterly and westerly direction. There was a great flow of traffic from the end of the Edgware-road near Marble Arch along Seymour-street, Wigmore-street, Mortimer-street, and Goodge-street into Tottenham Court-road, and in an easterly direction along Guilford-street, but, perhaps unfortunately, Bloomsbury to-day offered considerable obstruction to the continuance of this east and west traffic route. It could not be crossed at any point without deviating from the direct line, and to break through the area so as to provide a continuous route east and west could only be done to-day at an almost prohibitive cost. This he did not regard as an absolute necessity; most of the traffic which passed along Goodge-street either turned north or south, up or down Tottenham Court-road, eventually reaching the Euston-road or Oxford-street, or else completed its journey in Bloomsbury. It was true that Guilford-street was a useful exodus from Bloomsbury in an easterly direction, but only to the Gray's Inn-road. It was also true that by continuing across the Gray's Inn-road one eventually arrived at the Angel, but this route could never be seriously regarded as an important east and west artery. Of greater importance were possible improvements that could be made in diagonal directions and at knotty points in the one main thoroughfare, Southampton-row and Woburn-place. Perhaps the greatest flow of diagonal traffic occurred between Shaftesbury-avenue and Euston-road about St. Pancras and King's Cross Stations. Traffic passing in this direction usually travelled along Coptic-street, Great Russell-street, Montague-street, Russell-square, Guilford-street, Grenville-street, and Judd-street. There was considerable delay in crossing New Oxford-street, and Coptic-street was extremely narrow, only admitting of two-way traffic at a slow pace, and the route between Russell-square and Grenville-street, after leaving Russell-square, was in anything but a direct line. Thus, a pressing problem was an improvement in this diagonal direction. The other diagonal—from south-east to north-west—was more easily negotiated and more direct. Thus, if in re-planning, consideration was given to improvements in the route—Shaftesbury-avenue to King's Cross—it did not appear to be necessary to consider further the internal traffic problem of Bloomsbury. Of much greater importance were the traffic problems at the four crossings—Kingsway and Holborn; Southampton-row and Hart-street; Upper Woburn-place and Euston-road—and last, but not least, the important crossing of Tottenham Court-road and Charing Cross-road with Oxford-street, the remedial treatment for which was too important to be dealt with there.

Before suggesting solutions for these traffic problems, the speaker referred to the internal planning of the area, and considered it from the point of view of "user." They had, he said, in the Bedford Estate one of the most interestingly planned areas in London. As an early 19th century development, it was a masterpiece of urban residential building, replete with architecturally designed squares and open spaces exemplifying great skill in their design. It contained two great buildings—University College and the British Museum—which at once marked it as the intellectual area of London. From an area of private houses it was rapidly being converted into an area of hotels and boarding-houses. This was essentially its present character, but at the same time the influence of the two great buildings, the British Museum and University College, was, if not more widely certainly more intensively felt. The effect of the British Museum had been to convert the whole of that area between Great Russell-street and Oxford-street into a kind of Latin Quarter—a centre for art shops, book shops, and shops dealing in curios of all kinds. At the same time, extensions of University College were spreading down Gower-street on either side, and between Holborn and Great Russell-street and along Southampton-row the demand for office accommodation had resulted in the erection of new buildings on a vastly increased scale. Everywhere they saw re-building, raised cornice levels, wider streets, and buildings that absorbed areas and back gardens in built-over plots—a kind of improvement which in most cases called for improved site planning and a reconsideration of frontage lines, and this, not altogether to provide improved traffic conditions, but to give a greater amount of light and air, architectural effect, and an increased scale to the new buildings which were everywhere being erected. Thus, in replanning Bloomsbury, or that portion of it which lay in the parallelogram already referred to, the main problem to be dealt with consisted in making adjustments so as to provide suitable sites for buildings on an increased scale, and so as to preserve and increase the architectural dignity of the area, and a plan was urgently needed in order that this might be done consistently, and not piecemeal.

He had already pointed out that it might be an advantage if a through traffic route could be provided, say, from Goodge-street and Guildford-street. The provision of such a through route was, however, so intimately tied up with the plan of London, and so remote from, and indeed antagonistic to, the local interests of Bloomsbury itself, and altogether so difficult that he did not think it would be possible to provide for it except in a town planning scheme that might be contemplated in the very near future. Personally he did not think it was needed at all. He suggested that apart from such local improvements as, possibly, the provision of a better turning space at the end of Torrington-place, it would not be advisable to embark upon a costly improvement scheme in an easterly and westerly direction. The necessity did not appear to him to justify the great cost that would be entailed. Many years ago, when he was younger and, perhaps, bolder, he prepared a scheme for rebuilding that area which lay between Hart-street, Oxford-street and Great Russell-street. In this scheme he made provision for a greatly improved crossing between Shaftesbury-avenue and Montague-street. It was a good scheme, b very drastic, and included a new ma thoroughfare in front of the British Museu to the Strand. This scheme was prepar years ago, and before Kingsway was co menced, and whilst he still thought th great improvements to the plan of Lond should be made in that area which l between Oxford-street, Endell-street, Kin way and the Strand, any such improvemer would not seriously affect the planning Bloomsbury. He thought that at the prese time it was quite outside the pale of practic politics seriously to suggest so dras improvements as this scheme contemplate though if boldly handled it would, no doul prove very remunerative in the long ru He therefore put forward the modest p posal of widening Coptic-street (late Dul street) at its western end. He knew the would be still a bad crossing at Oxford-stree but there would always be bad crossings London, and this was, after all, not a cro ing that could be described as of first impo ance, and such as to call for drastic reco struction of roadways at immense cost.

When turning to the problem of getti from Russell-square to King's Cross t speaker pointed out that traffic usually to the route—Guilford-street, Granville-stre and Judd-street. Another route was Barnar street and Marchmont-street, but such route was too narrow for the purposes of main thoroughfare. It appeared to him th an important improvement awaited develo ment by turning Flaxman-terrace in Woburn-place, and this without breaki into Sir Edwin Lutyens's British Medic Association building. It would really mea improved entrances at the corner of Torrin ton-square and at the corner of Euston-ro and Mabledon-place.

He had no comments to make with rega to the improvement of Southampton-row between Hart-street and Euston-road, exce that it was a pity that when widened it w not made wider. However, when widen from end to end, it would be about 45 between curves, almost as wide as Kingsw and an excellent thoroughfare, and th must accept it in that condition. In t crossing of Hart-street and Theobalds-ro at Vernon-place they had one of the m awkwardly planned and badly congest crossings in London. At the juncture of ordinary bad crossing they had the entran to the Kingsway Tunnel. There was a the very bad but more easily controll traffic crossing between Kingsway, Sou ampton-row and High Holborn. Th latter crossing might be improved a scheme of widening Southampto row at the north-west corner of t crossing. Let them direct their attention an improved crossing at Vernon-place, a here he would show a proposal, the princi of which was first advocated by Lord We and which was deserving of some conside tion. It was the principle of introducing bridge along the line of the widest of t thoroughfares at a crossing. It appeared him that a better position for an experime of this kind could not well be found. If bu to take more than two lines of traffic it wo necessitate the removal of some of the bui ings and the setting back of the building li on the east side of Bloomsbury on the no side of the crossing. Speaking generally bridge crossings, they must not confuse treatment of this kind with bridges, such Holborn Viaduct, or such as was propo should cross the Strand at Charing Cro These were cases of roads crossing another at different levels, and came unc quite a different category. In the case un consideration they had the main road w an increased width at its crossing to adm of a bridge, *i.e.*, a bridge which was entir disconnected from the surrounding buildi and architecture, and which was, as it we an independent feature set down in the mid of the road. He allowed for a 40-ft. roadw between the kerbs, Vernon-place and Th balds-road, and a 30-ft. road betw the kerbs of the bridge. The Kin



Proposal for a Bridge carrying Southampton Row over Vernon Place and Theobalds Road, Bloomsbury.

By Professor S. D. Adshead

way trams would rise up with the road at the Kingsway end. It was true that they might still cause some congestion where they emerged. It was obvious, however, that this could be avoided by continuing the tunnel into Theobalds-road, only at much greater expense. A bridge treated in this independent way need not be regarded as a thing unsightly and obstructive in its appearance and treatment. The main object should be to keep it what it was, a light structure designed in complete contrast to the hard architecture around.

Now a word as to the much debated question of the London University. Everyone was aware that some years ago the Government entered into an arrangement with the Bedford Estate to take over 11¼ acres of residential property for University purposes subject to the University authorities within a limited period showing some definite intenton of utilising same. The time over which this arrangement extended had expired, and the Government did not consider that there was adequate reason for renewing their offer. There had been a big question of King's College coming into Bloomsbury, but up to now there appeared to be no likelihood of this important removal eventuating; moreover, there had been talk of the Central Offices, at present occupying premises in the Imperial Institute, erecting their own buildings in Bloomsbury. The position at the present moment was obscure, but there was an indication that negotiati were proceeding to secure forthwith a sma area than 11 acres—possibly four acres- Bloomsbury for University development. meet these varying needs and considerati different schemes had been put forward, he submitted, in the first place, two sche of a somewhat ambitious nature which w prepared for the utilisation of a very la proportion of Bloomsbury as a gr University centre. He also submitted m recently prepared schemes by Mr. H. Lanchester and Professor Richardson utilising for University purposes a m smaller portion of the area. Mr. H. Lanchester visualised the coming of central University Block. He evidently

Extension of University Area, Bloomsbury.

Suggested by Professor S. D. Adshead.

d to include a hall for Degree Day cere-
es, examination halls and offices; also a
nts' Union Library. Professor Richard-
equally ambitious scheme included a
quadrangle opposite the northern
e of the British Museum, to the north
hich was a great hall. Behind this in
on-square were hostels on either side.
and west of this square were offices.
utes and Union; also a library and
e. A scheme which he himself was
itting was, perhaps, less ambitious than
two, and differed from both of them in
ng the entrance to Torrington-square
He did not consider that there was
ient space satisfactorily to allow of the
on of a great hall in a central position
and it was a mistake to block up
ngton-square. Should a great hall ever
uilt in this neighbourhood, it should
y one of the adjoining residential
s. A site might, perhaps, be found
between Tavistock and Gordon-
re or opposite my proposed new eastern
nce to University College. It would
to be a building as big as the Albert
which was full to overflowing on
ee Day, and in his view the building of
a Hall in Bloomsbury for little more
Degree Day ceremony was to misunder-
the relation of such a building with
buildings of the London University.
utting on Torrington-square, he would
st that sites be reserved for extended or
departments of University College; that
e be reserved on the west side of the
re—which he had designed as a dignified
nce to Torrington-gardens—for the
nts' Union, and that other sites along
r side of the British Museum-avenue
cupied by offices for the University or
eserved for examination halls and for
purposes as a Senate and, perhaps,
ry. His suggestion for a students'
l was that it would be better placed on
per land, and that no better proposition
be made to meet this very important
rement than to acquire and adapt the
dling Hospital and grounds.
conclusion, he could not help feeling
the old 19th century architecture of
nsbury was doomed, as was the Regent-
t of Nash. Already Woburn-place was
lly exchanging its residential property
xamples of buildings designed on the
modern lines. All those blocks between
ington-square and Southampton-row
d rapidly follow, but in any new scheme
nprovement they must take care that
ential buildings alone be allowed, and
the well-planned squares and connect-
venues remained.
r. Raymond Unwin, in proposing a vote
hanks to the author, said the sugges-
of a bridge in Southampton-row ought
to be ruled out of consideration, and
would probably before long get en-
ement from Detroit on this subject,
re a number of roads were being con-
cted with bridges to carry the traffic
the side streets. It was quite a
tical, although an expensive, scheme,
no doubt if it was a necessity they could
some means of dealing with the
lem of appearance.
r. W. Harding Thompson seconded the
on, and expressed the necessity for quad-
ular areas in a residential district such
loomsbury. He did not agree with Pro-
r Adshead when he said he now thought
arly scheme for opening up the British
eum was too ambitious. The Museum
one of the most important buildings in
pe, and was quite tucked away.
derman Culpin (L.C.C.) pointed out that
L.C.C. had scheduled two sites in
nsbury under the Town-Planning Act,
a preliminary statement would be laid
re the Council. He hoped the Institute
d examine this report, and not allow the
ty Council to go before an inquiry un-
lenged if the intention was merely to
uce the cheapest kind of scheme, and
ss the scheme was worthy of London.
r. W. L. Hare expressed the opinion that something in the nature of diagonal roads were needed in Bloomsbury.

The resolution was carried, and briefly acknowledged by Professor Adshead.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Architecture at the Royal Academy.

Sir,—Your editorial remarks last Friday about the uncertain habit which continues to prevail as to the choice of exhibits illustrative of architecture at Burlington House, are in agreement with my unique journalistic experience reckoned from 1873. During half a century I have been unable to arrive at any conclusion as to the methods adopted by generations of selecting committees, and perhaps the one certainty to be depended upon is the odd rule that the unexpected is most likely to happen. Possibly this state of things is inevitable, and certainly some of the most annoying rejections have been experienced by architects who later on became members of the Royal Academy, doing the same sort of injustice when they in turn acted as hangers. One of the most foolish incidents of the kind that I remember happened in 1885, when the late William Young won the famous competition for the Glasgow Municipal Buildings. I made a big perspective of his chosen design, which he sent in that year. It represented the result of the biggest architectural contest at that time, but the subject was rejected. Next year, when the interest of the matter had to some extent been modified, the same drawing was again submitted and hung on the line in a place of honour in the same gallery. Many exhibits of far less merit and importance on both occasions being, of course, included. It was not a question of space, but a sheer act of folly. William Young was so annoyed that he exhibited this successful design without any reference to Glasgow, as may be seen in the Academy catalogue for 1886, No. 1,587, under the title of "Municipal Buildings Now Being Erected" Maurice B. Adams.

Architecture at the Royal Scottish Academy.

Sir,—"The Designer," in his letter in your issue of May 6, makes reference to my remarks on his sketches for coloured cement roundels for the aquarium at the Edinburgh Zoo. My remarks applied to the sketches. If he had shown photographs of the finished work we might have been in a position to judge of its success or otherwise. It is therefore evident that anything I said could not refer to Mr. Thos. Beattie's craftsmanship. It may interest "The Designer" to know that inlaid coloured Portland cement work was used in the Grand Hall of the first International Exhibition held in Scotland, at Edinburgh, in 1886. B. B.

Stone Preservation.

Sir,—The report of Mr. H. Jarman's lecture on the preservation of stone work, in your issue of April 15, was of real interest; at the same time, however, it should be pointed out that a real remedy for decay in stonework, such as Mr. Jarman calls for, does in fact exist. He was probably correct in condemning the use of oils, waxes, etc., as stone preservatives; they cause considerable darkening of the work and cause ultimate flaking. Treatment by double decomposition is not only of little use for the reason Mr. Jarman gave (dehydration and shrinkage of crystals), but also because almost invariably, when stonework is treated with two different chemical solutions, *e.g.*, a silicate and a chloride, water soluble products are formed in the reaction which will cause very objectionable efflorescence on the surface and complete disintegration of the pore-filling crystals. The obvious thing required is a solution which will chemically combine with the stone. No. 2 Metallic Liquid does this and it produces an intense hardening effect.

Mr. Jarman rightly attributes the decay of calcium carbonate stone, generally admitted to be the most commonly and easily decaying stone, to the formation of calcium bi-carbonate from atmospheric sulphur and carbon dioxide. He says that flaking is caused by formation of soluble lime salts from the mortar penetrating the stone, there to be oxidised. The liquid above mentioned acts on the calcium carbonate of the stone and the lime of the mortar to form hard, inert substances unacted upon by sulphur, sulphurous acid, carbon dioxide, etc., and in this reaction no water-soluble compounds are formed which will rise to the surface; the results are absolutely permanent, and no discolouration takes place.

How preservative solutions are to be applied "internally" is rather difficult to perceive; it seems that external application must remain the practical treatment; one would expect the more porous and vulnerable the stone the greater ease of penetration of preservative. "Metallic Liquid" also prevents fungoid growths, which is an additional advantage.

R. G. Hall.

How the Country Is Spoilt.

Sir,—About ten miles from the City there was a pleasant little town, and within the last few years the entire appearance has been changed. From the platforms of the railway station there used to be a mass of foliage, looking lovely at this time of the year; now there are small houses, all alike, and no trees. Proceeding onward down this road, you come across more houses of the usual type, and then the abortion called the War Memorial, chosen by a committee without taste; then to a very ugly building erected for a club, now used as a temporary Roman Catholic Church, but fortunately concealed by a hoarding. Then we come to vacant land, part of the rectory garden, facing the High Street. Here two very commonplace houses and shops have been erected, and in consequence of the street being laid out not at right angles with the main road, none of the rooms are square.

Lower down the High Street a very ugly garage has been erected, with a sign projecting over the pavement and obscuring the view of the beautiful parish church. In other roads houses of ugly design have been erected, and so the country is rapidly being ruined. Chartered Architect.

The Liverpool Cenotaph.

Sir,—The enclosed cutting is from the *Daily Mail* of to-day, and I ask: What are the intentions of this nocturnal committee of inspection? Have the views of the several architects who have written to the Press caused the committee to think furiously and created a doubt as to the suitability of the site, notwithstanding the "irrevocable" decision of Sir A. Salvidge and his committee? But why 5 a.m. on a Sunday morning, and why was the model, or parts of it, cleared immediately after inspection?

There is nothing to be ashamed of in making a mistake or an error of judgment. Only the small mind persists in bolstering up his error; the big mind admits it and amends it.

Are we to understand that the public are not to see the model of the Cenotaph as designed, and are they to be prohibited from passing judgment, favourable or otherwise? I ask Sir Archibald to tell us the reason for this secret and clandestine action. If some strong reason is not forthcoming for this Sunday morning 5 o'clock inspection, the public will draw their own conclusion, and Sir Archibald and his committee will have only themselves to blame if they draw the wrong ones.

T. Taliesin Rees.

Liverpool.

Foord Almshouses.

The view of these buildings, which we publish this week, is taken from the shelter in the centre of the quadrangle looking towards the Hall and central block of buildings on the north side, and shows the old-world character of these important buildings, which has been the architect's aim, and has been very successfully achieved. The buildings are now completed and will be formally opened next month, and it is understood that Their Royal Highnesses Prince and Princess Arthur of Connaught will perform the ceremony.

Mr. E. Guy Dawber, A.R.A., P.R.I.B.A., is the architect.

New Premises at Norwich for Barclay's Bank, Ltd.

These large and important new premises are being erected in a prominent position with frontages to Bank Plain and Castle Meadow. A portion of the site which they will cover is at present occupied by the existing premises of the Bank, which were erected in the 18th century and were occupied about 1780 by John and Thomas Gurney. The extensive business which was developed by this well-known banking family was merged in Barclay's Bank, Ltd., in 1896. Advantage is being taken of the demolition of the existing buildings to effect a desirable street widening, and the Bank has generously given free of charge to the city the land required for this scheme of improvement. Accommodation will be provided for the Local Board of Directors and district manager, in addition to what is required for conducting ordinary banking business, with special departments for securities, stocks and bonds, and foreign transactions. The most distinctive feature of the new building will be the large banking hall, 130 ft. long by 53 ft. wide and 52 ft. high, with an aisle extending to a further distance of 9 ft. on each side. The internal treatment consists of a barrel-vaulted ceiling rising above an arcaded order with barrel vaults over the aisles below the level of the main cornice. The exterior has been designed so as to recall the character of the existing premises, which are to be demolished, and in conformity with the style which is typical of Norwich and other provincial towns during their period of development towards the end of the 18th century. It will be constructed with hand-made facing bricks from Messrs. Franks, of South Ferriby, Portland stone dressings, and roofed with Delabole slates.

The general contractors are Messrs. Thomas Gill and Son, of Norwich, and the architects are Messrs. Brierley and Rutherford, of York, in collaboration with Messrs. Edward Boardman and Son, of Norwich. The underline to our supplementary plate, which was taken from the R.A. catalogue, was printed before we received the architects' description of the work, and thus the names of Messrs. Boardman and Son do not appear upon the reproduction. We should like, therefore, to draw special attention to the fact that Messrs. Boardman and Son are jointly associated with the work.

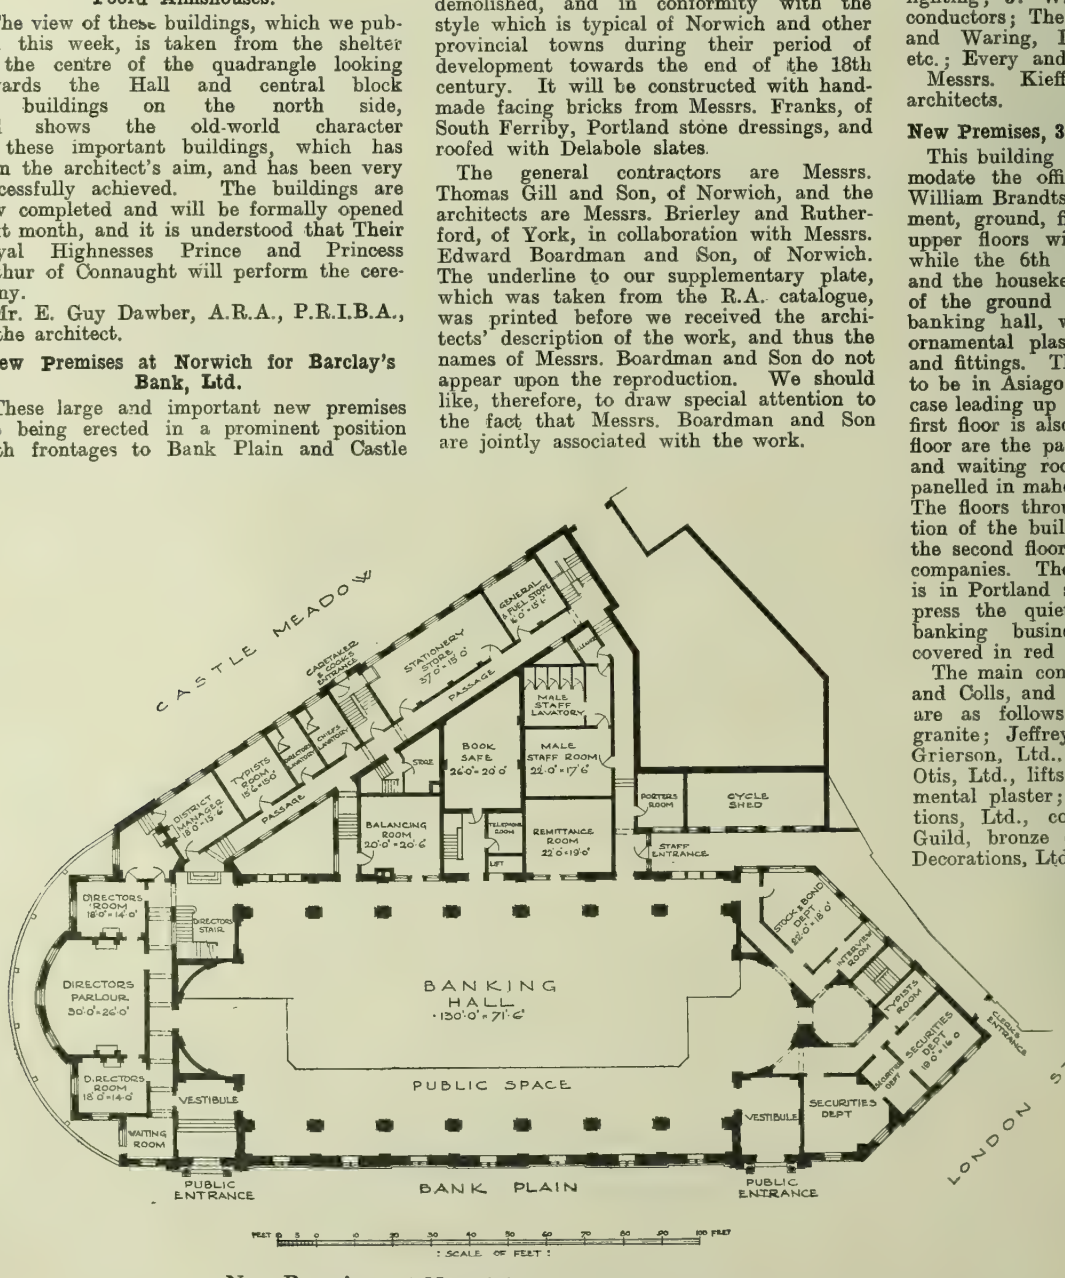
New Winceby House School, Cooden, Bexhill-on-Sea.

This girls' school has been erected abo the cliffs at Cooden, for the Misses Wils It has been planned along modern lines, w a courtyard in the centre, and provi accommodation for 65 boarders. The site an open one with pleasant views on all sid The walls are faced with hand-made Suss stock bricks, with wide flush joints. T roof is covered with "Italic" hand-ma tiles. Internally, all classrooms, corrid and cloak-rooms on the ground floor ha been finished with sand-lime bricks a flush joints. The upper floors are plaster The woodwork generally has been stain and the staircases are constructed of te The ground floor has been entirely cove with jointless composition flooring, and upper floors boarded. The courtyard been paved with brick and stone.

The general contractor was Mr. Kerridge, junr., of Sturton Street, C bridge, who also executed the whole of joinery. The sub-contractors were follows :—McDowall Steven and Co., heat and hot water, sanitary goods; "Marbell Ltd., composition flooring; Roberts, Adl and Co., tiling; Rockall and Co., elect lighting; J. W. Gray and Son, lightn conductors; The Albany Forge, Wainwri and Waring, Ltd., ornamental ironwo etc.; Every and Co., steelwork.

Messrs. Kieffer and Fleming are architects.

New Premises, 36/38, Fenchurch Street, E



This building has been designed to acc modate the offices of the firm of Mes William Brandts, Sons and Co., on the b ment, ground, first and second floors. upper floors will be available for letti while the 6th floor consists of lavato and the housekeeper's quarters. The wh of the ground floor is taken up with banking hall, which is to be panelled ornamental plaster with a mahogany d and fittings. The columns and pilasters to be in Asiago marble. The private st case leading up to the partners' room on first floor is also in mahogany. On the floor are the partners', secretary's, lunch and waiting rooms, all of which are to panelled in mahogany for their whole hei The floors throughout Messrs. Brandts' tion of the building are in cork tiling. the second floor are the offices of subsid companies. The facade to Fenchurch St is in Portland stone and is designed to press the quiet dignity of an impor banking business. The roof is to covered in red Lombardic tiling.

The main contractors are Messrs. Trol and Colls, and the principal sub-contrac are as follows :—Fenning and Co., I granite; Jeffreys, heating and ventilat Grierson, Ltd., electrical work; Wayg Otis, Ltd., lifts; Cashmore Art Guild, mental plaster; Art Pavements and De tions, Ltd., cork flooring; Cashmore Guild, bronze doors; Art Pavements Decorations, Ltd., terrazzo mosaic and til Chatwood Safe Co., strong-room doors; and Finnis, gla bricks; Caston, Ltd., enclosures and mental work; Willi Gamon (Kaleyards), metal windows; A Williams, Ltd., arte wells.

The architects Messrs. Campbell J Sons and Smithers.

nts	—	—	—	—	570	654
ationers ...	—	—	—	—	1606	1,899

ing the official year since the last annual eral meeting, 137 fellows, 164 associates, 37 licentiates have been admitted, as nst 183 fellows, 138 associates, and 392 tiates in the previous year.

f the 1,415 fellows whose names appear in current *Kalendar*, 561, or 40 per cent., e elected from the associate class ; 283, or er cent., were elected from the licentiate s after examination; 285, or 20 per cent., e elected without examination, under the litions which existed before the grant of charter of 1909; 214, or 15 per cent., were itted under the charter of 1925; 44, or r cent., were elected under Section IV, ise c (ii) of the charter of 1925; and 28, 2 per cent , were elected by the council er the powers contained in Clause 2 of charter of 1909. Of the 2,420 members he associate class, 1,349, or 55 per cent., e been elected since the date of the Armis- . Of the 2,130 licentiates, 1,160, or 55 cent., were admitted under the charter 1909, and 970, or 45 per cent., under the rter of 1925.

Travelling Cards.—Since the issue of the Annual Report 112 Travelling Cards e been issued for the use of members and dents visiting places of interest abroad; Cards have been issued for use in the ited Kingdom.

Premises.—The Premises Committee have died several sites which have been brought their notice, and have explored the possi- ities of rebuilding in Conduit-street. e work of the Committee, which has in- ved a great deal of detail labour during e past year, is now drawing towards the finite decision which was foreshadowed in e annual report a year ago.

Business Meetings.—The Council have ap- ved the proposal of the Practice Standing mmittee for instituting at business general etings, discussions on matters of profes- nal interest at the conclusion of formal siness. No previous notice need be given, d the proceedings will not be reported in press or Journal.

Competition for an Imaginative Scheme for Aerodrome.—The Council have accepted offer from the Gloucestershire Aircraft mpany to give a prize of 200 guineas for a dents' competition for an imaginative heme for an aerodrome. The arrangements the competition are now under con- eration.

Proposed British Institute in Paris.—The uncil have decided to support the proposal found a British Institute in Paris for dents.

Students.—217 students have been added the register during the year ending bruary 28, 1927, and 141 have received ex- ption from or passed the final (or special) amination qualifying for the associateship.

Preservation of Old Work.—During the riod under review the Art Standing Com- ttee have had under consideration numerous ses of civil and ecclesiastical buildings, idges, etc., which have been threatened demolition or alteration, in addition to rk requiring restoration or protection. All se cases have required considerable inves- tigation, and where the work has been found to be worthy of preservation the committee have made suitable recommendations thereon, and where possible have supported the action taken by other interested societies. In this connection the following have been under consideration by the committee :—Pulteney Bridge, Bath; Abingdon Bridge; Old Church, Stanmore; Old Buildings at Plymouth; Newcastle House, Lewes; Harrington House; Abbot's Kitchen Grounds, Glastonbury; Montpellier-walk, Cheltenham; Stratford-place; stonework at the Houses of Parliament.

In reviewing the work and duties of the committee for several years past, it has become increasingly obvious that this consideration of old work—necessary as it is—has occupied a large part of the committee's time, and the committee have now under consideration some proposals for reorganisation, which it is hoped will enable it to deal with matters of a wider architectural interest.

Smithson Drawings.—The outstanding event of the session (states the Art Standing Committee) was the acquisition, with the assistance of the Grissell Legacy, of the Smithson drawings by the Royal Institute. This unique collection of early seventeenth-century architectural drawings has been in the custody of the R.I.B.A.. for many years, and when the owner, Mrs. Coke, intimated her intention of disposing of the collection, the committee felt very strongly that it would be a serious blow to the prestige of the Institute if the drawings were allowed to pass from the R.I.B.A. library. Mrs. Coke was very anxious that the collection should remain where it was, and did not want it to leave the country, although she realised that in all probability a higher price might be obtained abroad. After making inquiries as to the probable value of the collection, the price was agreed, and the drawings have now become the property of the Royal Institute, and will hereafter remain in the library for the use of the students.

Professional Defence Union.—Since the publication of the last annual report, the council have approved the Practice Standing Committee's recommendations. Registered offices for the union have been approved at No. 28 Bedford-square, and Messrs. Ball & Redfern, of No. 10, Gray's Inn-place, W.C.1, have been appointed as advisory solicitors, and are at present engaged upon the preparation of draft articles of association for the union. It is hoped that very shortly the union will be in a position to call a general meeting to adopt the articles of association and definitely launch the scheme, as sufficient support has been promised.

Bills of Quantities.—A suggestion by the builder members of the Architects' and Builders' Joint Consultation Board that bills of quantities should be supplied for all contracts let by competition where the amount involved exceeds £750 in the provinces and £1,000 in London was submitted by the council of the Institute on the recommendation of the architect members of the Board to their allied societies conference, with a view of ascertaining the feeling of architects generally throughout the country. The result of such consideration was that the council of the Institute did not think it desirable to make any departure from their previous recommendation on this matter, viz., that in the case of ordinary works exceeding £1,000 in value contractors who are invited to tender should be supplied with bills of quantities.

Time Limits in Contracts.—A request having been preferred by a conference of representatives of the London Master Builders' Association, the National Federation of Building Trades Operatives (London District), and the Amalgamated Union of Building Trade Workers (London District) for a deputation therefrom to be received by the Council of the Royal Institute relative to time limits in contracts, the latter body suggested that the matter should preferably be raised before the Architects' and Builders' Consultation Board, and in due course the deputation was received by that body. On behalf of the London employers it was pointed out that contractors are frequently invited to state their own time limit when tendering for work, with the result that the tenderer who gives the shortest time limit frequently obtains the contract, whether his price is the lowest or not. As the result, overtime usually becomes necessary, and in the present state of the supply of labour, results in upsetting the labour relations with other employers.

On behalf of the London operatives it was pointed out that this practice resulted in overcrowding jobs with men and that in turn led to inefficiency and lowered output, besides causing friction between employers and operatives in connection with the application of the overtime regulations. It also increased unrest on jobs due to the creation of an overtime outlook on the part of the men. It was pointed out to the deputation that the question appeared to resolve itself into one of finding a method of ascertaining beforehand what is a reasonable time for the execution of a particular work, and it was suggested that the deputation should put forward to the Board a further memorandum proposing practical remedies, to which in due course publicity might be given.

Competitions.—During the period under review the Competitions Committee have dealt with 25 competitions :—

(1) In 17 cases the conditions of competition have been satisfactory and no amendments have been suggested.

(2) In 5 cases negotiations with promoters have resulted in amendment of conditions originally unsatisfactory and the competition has been held with the approval of the R.I.B.A.

In 3 cases promoters have refused to amend conditions, and veto of the competition has been advised.

The committee have under consideration a number of suggestions for the revision of the regulations and model form of conditions, which will shortly be reported to the council and will include recommendations on the following points :—

(1) The inclusion of a clause in the model conditions as to the return of the deposit within a specified time.

(2) The modification of clause in the model conditions governing the limit of cost.

(3) The amplification of clause (*c*) of the regulations dealing with the staffs of assessors.

The general tendency in one part of the kingdom to limit important competitions to local architects only has also received consideration by the committee.

Annual Service for Art in Westminster Abbey.

With reference to the following letter, which has been received by the R.I.B.A., it is requested that members who wish to attend the service to be held on Thursday, June 2nd, at 5 p.m., will kindly notify the Secretary, R.I.B.A., as soon as possible, and in any case not later than May 20th:

Royal Academy of Arts,
Piccadilly, London. W.1.

DEAR SIR,—The President and Council of the Royal Academy desire me to inform you that they have made preliminary arrangements with the Dean and Chapter of Westminster Abbey for holding an annual service for Art in the Abbey, and that it is proposed to hold the first service this year on or about Thursday, June 2nd, at 5 p.m. The Royal Academy will undertake the advertisement of the service and the issue of tickets; and I am to request you to be so good as to let me know whether your members would be likely to attend the service in good numbers and about how many seats would be required for them and their wives. I should also be pleased to lay before my Council any remarks on the proposal which your society may think fit to make.—Yours faithfully,

(Sgd.) W. R. M. LAMB, Secretary.

THE LONDON SOCIETY.

ANNUAL DINNER.

The nineteenth dinner of the London Society was held on Friday last at the Hotel Victoria, Northumberland-avenue, the President, Lord Crawford and Balcarres, P.C., K.T., P.S.A., being in the chair. The guests of the evening were the members of the Royal Commission on Cross River Traffic, namely, Lord Lee of Fareham, the Viscount Hambledon, Sir Willoughby Dickinson, Professor Charles Inglis, Sir William Plender, Sir Lawrence Weaver, and the Chairman of the R.I.B.A. Conference of Societies, Mr. Arthur Keen, V.-P.R.I.B.A. The company, which numbered about two hundred, also included Sir Alfred Rice-Oxley and Messrs. R. Stephen Ayling, J. W. Stanley Burmester, Harold Cox, W. R. Davidge, William W. Dove, G. W. Humphreys, Percy W. Lovell, Henry Tanner, Carmichael Thomas, and Miss L. C. Crum.

Mr. Arthur Keen, proposing the toast of "The Royal Commission," reminded his hearers that the London Society was an important constituent in the conference of societies set up to define a line of action respecting Waterloo Bridge, and to this conference the Commission's report represented the crown of its efforts. Early in their work the members of the conference went to the County Council, and asked that the condition of Waterloo Bridge should be the subject of inquiry by some independent authority. They were received with courtesy, but the Council did not concede what they asked, though they persisted and returned to the charge again and again. Ultimately they went to the Prime Minister and suggested reasons why the State itself should intervene. The three things they had asked for were :—(1) The abandonment of the St. Paul's Bridge scheme, which constituted a threat to the cathedral; (2) the retention of Waterloo Bridge, which by itself would have been worth all the effort; and (3) the building of a great bridge at Charing Cross. Since then they had had the report, and to the members of the conference it was completely satisfactory. He was, however, still hoping that the suggestion that Waterloo Bridge should be widened might be allowed to stand over until the need of widening became not only apparent but urgent. He believed that before long the improvements suggested by the Commission would become not only urgent but imperative. It was impossible to control the growth of traffic, and the strain now imposed on the streets was enormous. The Commission's report amply justified, and showed the need for a civic institution such as the London Society.

Lord Lee, replying to the toast, said what he would like to know was what was happening about the matter of the bridges? It was a year next month since they were appointed to deal with a matter of "extreme urgency." At the time, and even afterwards, the London County Council did not make the task easier by creating the impression that Waterloo Bridge was on the verge of collapse. The report was published five months ago. What was the position to-day? With respect, they were bound to say that the Government, the London County Council and the authorities concerned were not getting on with the job. He gathered that the London County Council were prepared to acquiesce in their (the Commission's) recommendations with regard to Waterloo Bridge so long as it was worth their while financially — and provided that the Charing Cross project was gone on with simultaneously. In that he was sure they were absolutely right. The Commission's scheme was an indivisible whole, an entity, and it should be considered as such. Charing Cross was the key of the whole position so far as this question of cross-river traffic was concerned. He had some knowledge of Government departments, and supposed there was the usual haggling in the Treasury, arguments as to whether the figures were net or gross, and doubts whether the estimates prepared by the Royal Commission were infallible. The figures were as reasonable as could be calculated in the circumstances. No doubt the piles of correspondence on the matter were growing day by day, but the serious condition of our streets was growing faster still, and the congestion of our traffic was increasing. At present the development of the motor-car in this country was only in its infancy. In the United States there were five times as many cars per head of the population as there were in this country to-day. In London there had been a 25 per cent. increase in cars each year during the last four years, and that meant that the number of vehicles was doubling itself every four years. Seeing that a great scheme like that at Charing Cross would take the best part of a decade to complete, the position was simply that, unless we got on with the job at once, the streets of Central London would become absolutely impossible. The job was not going to get any easier or any cheaper for waiting. There was no excuse at all. If the Government was in earnest, and if the London County Council acquiesced, as they said they did, they should get on with the work at once.

Sir Lawrence Weaver, speaking to the topic, "What I think of London," related how, in the rockery at a house of a friend at Bromley, he discovered a piece of carving by Colley Cibber, which he recognised as being the coat of arms of the Hansa League — a very interesting witness of foreign domination which he had been the means of restoring to London. The speaker made reference also to the sarcophagus containing the body of Nelson in the crypt of St. Paul's. This, he said, was the work of Benedetto da Rovanza and had been intended for the bones of Cardinal Wolsey, but was never used for that purpose. For years it lay aside, presumably regarded as lumber, but in due course it occurred to the Office of Works of the day that appropriate use might be made of it, and it served for Nelson—thus showing how we made modern and reasonable use of ancient works of art.

Sir Willoughby Dickinson, also speaking to the same topic, described the view of London from Charing Cross Bridge, looking towards Waterloo Bridge and St. Paul's, as a sight the magnificence of which could not be found on the Tiber, the Seine, or any other river in Europe.

Mr. Harold Cox, proposing the toast of "Our President," commended the work of the London Society in trying to preserve the beauties of London and to hand them on to future generations. The great problem was how to prevent the growing congestion of London. There were more people in London than in Australia, and Australia was bigger than Europe. The tragedy of it was that the unattractive portions of London were eating up the countryside. There would be no solution of the problem until we could get people to live where there was more room.

Lord Crawford, in reply, said it appeared that the work of the Royal Commission could only be regarded as a *succes d'estime*. In the meantime, for a threatened building, Waterloo Bridge was sturdily upholding its existence, and other threatened buildings in London were doing their best to defy the worst fears of the pessimist. He hoped for the best with regard to St. Paul's and the Houses of Parliament. Each building in its own way represented a real and abiding triumph of British enterprise, resource, and art.

The Euphrates Building Contract.

An important contract for the steel work for a new bridge to be built across the River Euphrates at Falluja, Iraq, has, it is announced, been placed with Messrs. P. & W. MacLellan (Limited), of Clutha Works, Glasgow. The bridge, which will be of five spans each 180 ft. in length, supported by cylinders, is to be built at a point where the important desert route from Damascus to Bagdad crosses the river.

NEW CHAPEL OF TH GRAAN, ENNISKILLE

The new chapel of the Noviciate of Passionist Order at The Graan, Enniskil Co. Fermanagh, forms the last section group of buildings which have been in course of erection for several years p The plan of the buildings is in the shap the letter "E," the chapel forming limb, while the space between the two li forms an enclosed courtyard. The chape a single-aisled structure, with two apsi ended side chapels, chancel, and sacrist The general treatment of the interior, collegiate character, is simple; the roof formed with a plaster barrel vault in sected by minor arches, to afford height the side windows. The interior join work of the chapel is of oak. The walls panelled throughout to a height of ten f In the sanctuary are oak stalls for religious community. At the west end the chapel is an organ gallery with cur and panelled oak front, supported on flu columns, and with oak-panelled entra porch and screen underneath. The H Altar is of statuary marble, and the fron or antependium is filled in with a rep sentation of the "Last Supper." reredos is panelled in Pavonazza and gold yellow Sienna marbles. The altar is cove by a lofty ciborium or baldachino, suppor on columns of verde antique scagliola. floor of the body of the chapel is finished green and white marble terrazzo, while chancel is paved with slabs of varied Ital coloured marbles.

The architect is Prof. R. M. Butl F.R.I.B.A., of Dublin.

UNIVERSITY COLLEGE DUBLIN.

That portion of the new buildings of U versity College in Earlsfort Terrace, Dubl which has now been completed, is known blocks "A," "B," "C," and "D," a accommodates the Departments of Exp mental Physics and of Chemistry, Arts, a Administration. The other faculties of University are accommodated in the buildings on the site and elsewhere. scheme for providing new buildings initiated in 1912, and competitive desi invited, Mr. Henry T. Hare, F.R.I.B. London, being appointed assessor design submitted by Prof. R. M. Butl F.R.I.B.A., was selected, and has b completed in part, with, however, consid able modification.

The site consisted of the old Royal U versity of Ireland, which was not origin built for educational purposes, but for Dublin Exhibition of 1865. The build and site were acquired in 1880 by Government on the passing of Royal Lett Patent establishing the Royal Universi and in 1884 were added to; the additio buildings were designed by the architect staff of the Board of Works. When the Royal University was acquired by Univers College, as a result of the Irish Universi Act of 1906, it was apparent that the bu ings were entirely inadequate for the requ ments of the college, and unsuitable modern educational purposes; the site it was irregular in shape, and too restricted permit of suitable or sufficient accommo tion being provided. At this juncture adjoining plots of ground were generou presented to the college by Edward Ce first Earl Iveagh, M.A., LL.D., K K.C.V.O. The site was thereby squa and rendered somewhat more suitable the erection of new buildings.

A contract was let to Messrs. G. and Crampton, building contractors, Dublin, the work completed 1920. The scheme vides for the ultimate removal of all old buildings and the erection of an enti new college. The buildings are of st faced with a fine white limestone from Stradbally Quarries.

SOCIETIES AND INSTITUTIONS

OUTH WALES INSTITUTE OF ARCHITECTS.

hibition of Photographs of Modern Architecture.

the presence of a large and representa- gathering, the Lord Mayor of Cardiff rman William Grey, J.P.) opened, on lay, the Exhibition of Photographs of n Architecture arranged by the South Institute of Architects, in the Exhibi- Hall of the City Hall, Cardiff. The tion remains open to the public without e for the remainder of the week.

Lord Mayor, in the course of an sting speech, drew attention to some of isunderstandings which beset the path architect, and to the value of photo- y as a means of interesting the public hitecture. He expressed the hope that xhibition would help to make clearer e layman what the architects of South were doing.

C. S. Thomas, F.R.I.B.A. (Swansea), sed a vote of thanks to the Lord r, which was seconded by Alderman Thompson and carried with acclama-

C. F. Ward, President of the South Institute of Architects, was in the and among those present were Sir as Hughes, Captain D. Brynmor An- (Registrar of the University of Wales), A. H. Lee (Secretary of the National m of Wales), Mr. Gwilym Jones (High ble of Miskin Higher), Mr. J. J. Jack- Director of Education for the City of f), Mr. Harry Farr (Chief Librarian), vor P. Jones, A.R.I.B.A., Mr. Percy as, F.R.I.B.A., Mr. T. Alwyn Lloyd, B.A., Mr. I. Herbert Jones, B.A., Mr. S. P. Grant, F.S.A., B.A., Mr. W. S. Purchon, M.A., B.A., Mr. Harry Teather, F.R.I.B.A., Ir. F. S. Swash, F.R.I.B.A.

ong the more noteworthy of the exhi- nay be mentioned Messrs. Bates and s Newport war memorial; the Welsh al School of Medicine, by Mr. J. B. er; the restoration work at Cardiff , by Mr. J. P. Grant; a series of ent buildings of various types, by s. Ivor Jones and Percy Thomas; some ass housing work, by Mr. T. Alwyn shown both by photos and models; ood domestic work of a rather larger by Mr. F. S. Swash, Mr. Harry er, Messrs. C. S. Thomas and Herbert and Messrs. Willmott and Smith. Teather also shows an important train- ollege at Barry; Messrs. Thomas and some particularly interesting ecclesi- l work of non-Gothic types; and s. Willmott and Smith, an interior of asonic Temple at Swansea. Mr. C. F. (President of the South Wales Insti- shows a set of photographs of his cal college at Newport.

s not, however, our intention to criti- n detail the work submitted, or to em- e unduly its varying quality. A full f the exhibitors is given at the end, e would rather commend them all on wisdom in taking part in an exhibition ich, if some work reached a particu- high level, the general standard was and if, as must be the case in all exhibitions, some exhibits were below verage, they were well above the ard normally achieved without the help e architect. We take it it was to strate this latter fact, among others, the exhibition was held. As Cardiff's Mayor pointed out, many people as- in condemning a building, that an ect was responsible for it, while such robably not the case; and many others have the most erroneous notions as to the functions of the architect, too often assuming that his main contribution is to run up the cost.

The present exhibition should encourage the promoters not to consider it an isolated event, but the first of a long series. Incidentally, it will encourage the local architects to secure good photographs of their work, but its main effect will be to increase local interest in the work of the architect, and to raise the standard of architecture in the district.

Following is a list of the exhibitors:—

Messrs. F. R. Bates and Son, A.R.I.B.A. (Newport), C. F. Bates, A.R.I.B.A., and C. R. Jones (Newport), Edwards and Jones, AA.R.I.B.A. (Cardiff), J. B. Fletcher (Cardiff), John P. Grant, F.S.A., F.R.I.B.A. (Cardiff), J. P. Grant and W. Goodchild. AA.R.I.B.A. (Cardiff), Gordon H. Griffiths (Cardiff), J. A. Hallam, M.P.T.I. (Cardiff), Ivor Jones and Percy Thomas, A. and F.R.I.B.A. (Cardiff), T. Alwyn Lloyd, F.R.I.B.A. (Cardiff), J. A. Phillips and Wride, L.R.I.B.A. (Cardiff), Richards and McLean, A.R.I.B.A. (Cardiff), Hubert Rogers, L.R.I.B.A., and Ward (Swansea), Frank S. Swash, F.R.I.B.A. (Newport), Harry Teather, F.R.I.B.A. (Cardiff), C. S. Thomas and Herbert Jones, FF.R.I.B.A. (Swansea), C. F. Ward F.R.I.B.A. (Newport), and Willmott and Smith, A.R.I.B.A. (Cardiff).

SHEFFIELD, SOUTH YORKSHIRE AND DISTRICT SOCIETY OF ARCHITECTS AND SURVEYORS.

The Annual General Meeting of this Society was held in the general lecture room at the University on April 28, the President, Mr. F. E. Pearce Edwards, in the chair. The minutes of the last General Meeting were read and approved, the Annual Report was read and adopted, and the Statement of Accounts was presented and approved. The suggested alteration of Rules 3a, 4a, 4b, 4d, 17 and 18, as well as the insertion of the following paragraph hereafter to be called 4e—"That the Council may at its discretion modify or suspend the rules relating to entrance fees as above named"—were approved.

The following new members were elected:—Messrs. C. A. Broadhead, A.R.I.B.A., Wynyard Dixon, J. E. Lancashire, A.R.I.B.A.

The following were nominated for membership:—Messrs. D. G. Cockrill, L.R.I.B.A., W. A. Mitchell, L.R.I.B.A., H. Ogden, L.R.I.B.A., W. S. Playle, H. G. Rawcliffe, L.R.I.B.A., H. C. Scaping, L.R.I.B.A., W. Southall, L.R.I.B.A., H. Taylor, L.R.I.B.A., W. F. Wills, L.R.I.B.A.

Votes of thanks to the President, Vice-President, Hon. Treasurer and Hon. Secretary for their services during the past year were passed.

The election of officers and Council for session 1927-28, after the scrutineers, Messrs. J. H. Odom and H. A. Johnson, had counted the voting papers, resulted as follows:—

President: Mr. F. E. Pearce Edwards, F.R.I.B.A.

Vice-President: Mr. C. M. Hadfield, F.R.I.B.A.

Hon. Treasurer: Mr. J. R. Wigfull, F.R.I.B.A.

Hon. Secretary: Mr. H. B. S Gibbs, A.R.I.B.A.

Council: (Fellows) Messrs. E. M. Gibbs, F.R.I.B.A., W C. Fenton, F.R.I.B.A., W. J. Hale, F R.I.B.A., A F Watson, F.R.I.B.A., C. B. Flocton, F.R.I.B.A., W. G. Buck, F.R.I.B.A., E. M. Holmes, B.Eng., F.S.I., J. M. Jenkinson, A.R.I.B.A., H. I. Potter, A.R.I.B.A., J. C. P. Toothill, A.R.I.B.A., J. A. Teather, L.R.I.B.A.; (Associates) F. H. Wrench, A.M.I.C.E., L.R.I.B.A., J. H. Odom, A.R.I.B.A., J. Lancashire, L.R.I.B.A.

THE SURVEYORS' INSTITUTION.

Annual Meeting of Western Branch.

The annual general meeting of the Gloucester, Somerset and North Wilts branch of the Surveyors' Institution was held in Bristol last week.

In the annual report, which gave a résumé of the year's work, reference was made to the fact that a special sub-committee appointed to consider the advisability or otherwise of the Rent Restriction Acts being continued after December, 1927, made the following recommendations:—That the Rent Restriction Acts be ended at the earliest possible moment, but in view of difficulties it is suggested that by a gradual process the protection afforded by the Acts is reduced and finally determined in manner as follows: (a) That the protected rental of £78 or under at present in force should be reduced in two stages to a rental of £26 or under as imposed by the 1915 Act. Provided that any tenant whose protection is removed by this clause, and who is in the position of having purchased a house for occupation which is still under protection shall continue to be protected until such time as he can obtain possession of his own property.

(b) That a tenant who is in arrears with his rent for four weeks in the case of a weekly tenant, and three months in the case of a yearly tenant, should lose protection afforded by the Acts.

The Chairman, Mr. C. W. Yates (Gloucester), in moving the adoption of the report, said there was a Bill before Parliament dealing with the question of profession status in certain directions, but he felt that members could do more by educating the public, and by raising the standard of professional etiquette amongst themselves. More good could be done in that way than by Registration Bills.

Mr. F. A. S. Goodbody seconded, and the report was adopted.

Election of Officers.

The voting for the officers for the ensuing year resulted in the following being elected:—Chairman, Mr. F. A. S. Goodbody (Bristol); Vice-Chairman, Mr. A. W. Wilkinson (Taunton). Committee: Fellows, Messrs. W. C. Bateman (Colne), C. A. Bernard (Bristol), J. R. Corbett, M.A. (Bristol), C. F. Dawson (Bristol), W. C. Duckworth (Bridgwater), A. H. Llewellyn (Trowbridge), F. Peter (Gloucester), T. Sturge (Bristol), and W. J. P. Taylor (Bristol). Professional Associates, Messrs. C. F. Coleman (Bristol), F. W. Davies (Thornbury), W. A. James (Bristol), A. R. N. Joseland (Weston-super-Mare), and J. Poore (Badminton). Ex-officio members, Messrs. H. B. Napier (Long Ashton), A. E. Petter (Bristol), C. H. Smith (Chippenham), A. E. Williams (Cirencester), and C. W. Yates (Gloucester). Mr. C. H. Pritchard, B.Sc. (Bristol), was re-elected hon. secretary.

Following the business meeting a luncheon was held, at which Mr. F. A. S. Goodbody presided.

Proposing the toast of "The Surveyors' Institution," Mr. L. S. McKenzie, Bristol City Engineer, said civic engineers had much to do with surveyors, and they were brought into contact with each other a great deal in the course of their respective duties. He thought there was a very busy time for them ahead, having regard to the progress of town planning and the probability of new assessments of property.

Mr. A. Goddard, C.B.E., secretary of the Surveyors' Institution, asked what was going to be the position at the end of the year when the Rent Restriction Acts were due to come to an end. A report had been drafted by the Institution for presentation to the Minister of Health. Of still greater interest was the Landlord and Tenant (No. 2) Bill, which would go into the committee stage shortly, and which provided that a member of each tribunal to be set up should be a competent surveyor. Those tribunals would have to deal with many difficult questions that were bound to arise under the Bill when it became law.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XVII

BY H. V. MILNES EMERSON, A.R.I.B.A.

CHIMNEYS AND FLUES.

Note.—The words "The softest of wood staircases, etc.," in the first line of last paragraph in last week's issue, XVI., should read "the soffits of wood staircases, etc."

Section 64.—Rules as to chimneys and flues.

(1).—Chimneys built on corbels of brick, stone or other incombustible materials may be erected if the work so corbelled out do not project from the wall more than the thickness of the wall measured immediately below the corbel; but all other chimneys shall be built on solid foundations, etc.

Note.—Assuming a 14 in. breast is to be carried on corbels with a 9 in. wall under a pier of the full width of the jamb, and projecting 4½ in. from the face of the wall would comply, as the thickness of the wall measured immediately below the corbel would then be greater than the projection. Two 14 in. breasts, back to back, could, if required, project from a 9 in. wall with one 4½-in. pier, as the thickness of the wall measured immediately below either corbel would be greater or equal to the projection of either corbel.

(2).—Chimneys and flues having proper soot doors of not less than 40 square inches may be constructed at any angle, but in no other case shall any flue be inclined at a less angle than 45 degrees, and properly rounded. All soot doors shall be at least 15 in. distant from any woodwork.

Note.—Openings in flues for the insertion of ventilating valves shall not be nearer than 12 in. to any timber or combustible substance.

(3).—An arch of brick or stone or bar of wrought iron of sufficient strength shall be built over the opening of every chimney to support the breast thereof, and if the breast project more than 4 in. from the face of the wall, and the jamb on either side be of less width than 17½ in., the abutments shall be tied in by an iron bar or bars of sufficient strength, turned up and down at the ends, and built into the jambs for at least 8½ in. on each side.

Note.—The brick arch and bar has been largely superseded by the concrete lintol reinforced by one or more bars as required, and having a bearing of 9 in. or more upon each jamb. The depth of the lintol should be equal to 1½ in. per foot of span, with a minimum depth of 4½ in., with two ⅜ in. rods to each 4½ in. width for spans up to 5 ft., and ½ in. rods for spans over 5 ft.

(4).—This sub-section provides for a flue to be surrounded with 8½ in of brickwork when used for commercial purposes.

(5).—This sub-section provides a minimum height of 20 ft. for a flue from a steam boiler, etc.

(6).—This sub-section provides for parging or lining the inside of flues, and the external rendering of same where passing through floor or roof.

(7).—The position and course of every flue shall be distinguished on the outside of the work, as it is carried up by outline marks in some durable manner, except when the exterior face of the flue forms part of the outer face of an external wall not likely to be built against.

Note.—This applies generally to a party wall, when the adjacent site is left vacant, and should not be overlooked by the architect in his specification. The lines are usually painted in black or white.

(8).—The jambs of every fireplace opening shall be at least 8½ in. wide on each side of the opening thereof.

Note.—See sub-section 3 as to arches or lintols.

(9).—The breast of every chimney and the brickwork surrounding every smoke flue shall be at least 4 in. in thickness.

Note.—Providing the breast and flues are surrounded with 4 in. of brickwork, etc., the pockets can remain hollow if required. See sub-sections 4 and 5 for commercial flues.

(10).—The back of every fireplace opening in a party wall from the hearth up to the height of 12 in. above the mantel shall be at least 8½ in. thick.

Note.—For ordinary fireplaces the back would be carried up 8½ in. thick about 5 ft. from the hearth, and for kitcheners from 6 to 7 ft. from the hearth.

(11).—The thickness of the upper side of every flue when its course makes an angle of less than 45 degrees, shall be at least 8½ in.

Note.—The upper side only need be 8½ in. thick. See sub-section 2 for soot doors.

(12).—This sub-section provides that chimney stacks shall be 3 ft. above highest point of roof adjoining.

(13).—The highest six courses of every chimney stack or shaft shall be built in cement.

(14).—The brickwork or stonework of any chimney shaft, except that of the furnace of any steam engine, brewery, distillery or manufactory, shall not be built higher above the roof flat or gutter adjoining thereto than a height equal to six times the least width of such chimney shaft at the level of such highest point in the line of junction unless such chimney shaft is built with, and bonded to another chimney shaft not in the same line with the first or otherwise rendered secure.

Note.—The maximum height of a chimney stack with a least width of 18 in (one flue plus two 4½-in. walls) would be 9 ft. above the point of intersection with the roof. Sometimes with a stack on a flank wall and hipped roof, 9 ft. would not be sufficient to secure an adequate draught or to prevent downdraught. One can corbel out just below the intersection of the roof on one or both sides to a width equal to the thickness of the wall just below the corbel, in this case 4½ in. on either side, thus increasing the height of the stack 2 ft. 3 in. or 4 ft. 6 in. as the case may be, or, if the required height of the stack is a matter of inches, the gutter between the stack and the roof slope can be raised.

(15).—There shall be laid level with the floor of every storey before the opening of every chimney a slab of stone, slate or other incombustible substance, at the least 6 in. longer on each side than the width of such opening, and at the least 18 in. wide in front of the breast thereof.

Note.—The modern hearth is usually tiles laid on concrete, the tiling projecting 12 in. from the face of the interior or about 15 in. from the front of the breast. This leaves a space between the wood floor and the tiled hearth which some district surveyors allow to be filled in with the wood flooring, whilst others require the filling to be cement or other incombustible material. With modern fireplaces, a hearth projecting from the face of the breast 14 or 15 in. is ample, and this should be remodelled if and when the Act is revised.

(16).—On every floor except the lowest floor such slab shall be laid wholly upon stone or iron bearers, or upon brick trimmers or other incombustible materials, but on the lowest floor it may be bedded on concrete covering the site, or on solid materials placed on such concrete.

Note.—Concrete slab hearths have practically superseded brick or stone. A wood fillet is nailed round the trimmer and boards laid upon same to form centering. Lewis dovetail steel sheeting is ideal for this purpose. It can be supported by wood fillets or small angle brackets, or fixed to the underside of the wood joists forming both centering for hearth and lathing for ceiling.

(17).—The hearth or slab of every ch shall be bedded wholly on brick, st other incombustible substance, and sh gether with such substance, be solid thickness of 6 in. at least beneath the surface of such hearth or slab.

See note to sub-section 16.

(18).—A flue shall not be built against any party structure unless surrounded with new brickwork at 4 in. in thickness, properly bonded.

Note.—This sub-section should not b looked when planning fireplaces to a old building adjoining an existing part

(19).—A chimney breast or shaft with or in any party wall shall not away unless the district surveyor c that it can be done without inju affecting the stability of any building.

Note.—The decision of the district su should be obtained before pulling do making any alterations as above.

(20).—This sub-section specifies th poses for which a chimney shaft jamb or flue can be cut into.

(21).—Timber or woodwork shall placed

(*a*) In any wall or chimney nearer than 12 in. to the inside o flue or chimney opening.

(*b*) Under any chimney opening 10 in. from the upper surface of the of such chimney opening.

(*c*) Within 2 in. from the face brickwork or stonework about any ch or flue where the substance of such work or stonework is less than 8½ in. unless the face of such brickwork or work is rendered.

Note.—(*a*) A trimmer or joist on a wall would have to be 12 in. from the inside of any flue, etc., but trimmer or joist rested on an iron co could be less than 12 in. away. If 2 in. of the face of brickwork, etc., flue, and the brickwork being, say, thick, the face of such brickwork ad to the woodwork must be rendered.

An oak beam or beams in a timbere ing, for instance, can bear upon any of a chimney breast providing such b not within 12 in. of any flue, etc upper surface of the beam, if un chimney opening above, must not be 10 in. of the upper surface of the he that opening.

(22).—Wooden plugs shall not be nearer than 6 in. to the inside of any chimney opening, nor any iron hold other iron fastening nearer than the, etc.

Note.—Breeze fixing blocks are pre to wood slips near flues, etc.

Labour Association and Housing Sit

The building of houses for sale palliative for the housing situation Mr. F. A. Broad, M.P., speaking at nual meeting of the National Labour Association at the Essex Hall, Stran don recently. The problem, he tinued, could only be solved by the b of houses to let at rents which the man could afford to pay. The private lative builder had exhausted his but there were still no houses to let. people were, however, willing to put of bricks and mortar and a big m round their necks. That profiteerir rampant in the building trade was to everyone, but there was also prof in connection with the finance of dustry. Unless the Government toc trol of building materials and the fin the industry it would not be possible working man to pay an economic r any house he could reasonably occu London the housing situation was wor in 1919, and if there was any reduc the subsidy a turning point would be and building by local authorities largely cease.

A resolution was passed protesting a any reduction in the housing subsid

ports of the three reinforced concrete ns below is $\frac{W.L}{10}$ or zero? W. B.

Wood Worm.

IR,—Could any of your readers suggest a edy to stop wood-worm, or, as I believe is called, Death Watch beetle? In a se which has been built 25 years, the tings. floors and other woodwork are ng attacked very badly. J. M.

Sewer for Housing Development.

IR,—Plans for 84 houses have been sub- ted to a corporation, with the request t my clients desire the corporation to the sewer, approximately 375 yards g, which is required for the development the land. The road is termed a forest d, but it is included in the town planning eme of the district and eventually will 50 feet wide. The corporation refuse undertake to lay the sewer, as they term private sewer, and state that my clients responsible for it. I should be glad to eive your opinion, as I am under the ression that the corporation, under the blic Health Act, are bound to provide sewer for such a large scheme, and ecially as working class houses are ently needed in this district.

INTERESTED QUERIST.

A local authority has, under Section 23, the Public Health Act, 1875, power to orce the drainage of an undrained house a sewer which the local authority are itled to use, and which is not more than feet from the site of such house; the ance being taken from the house or some mestic office occupied with it. Such drain ts in the local authority on completion, n though no houses have been built to nect with it; for, under the Act the er includes a drain, and all sewers are ted in the local authority. Further, the l authority may proceed to link the drain by another new sewer, to their general tem. But, by Section 25 of the Act, if re is no drainage within 100 feet of the then drainage of the house or houses st empty into a cesspool or other place the local authority directs. And these vers apply in all urban districts, as also in rural districts which have obtained urban powers in these respects. Now, the plan shows an existing sewer considerably over 100 feet away from the site of the nearest building; and from that, also, it follows, that the local authority cannot compel drainage thereto, though effectual drainage of all the houses emptying into a cesspool or other place is enforceable. But there is no law, which in the circumstances described, will compel the local authority to lay a drain 375 yards long, which they rightly term a private sewer, and the fact that working-class houses are urgently needed and that it is proposed to lay no drain in a "forest road" which is included in the town planning scheme by the district, does not affect the question. The local authority are not bound to provide a sewer for the scheme. If "Interested" requires the said drain—which he does, as the only practical way of dealing with the matter in hand—he should approach the local authority, with the view of some amicable arrangement being effected; and, asking for a contribution to the expense which, in all the circumstances, the local authority might see its way to make. Further, it might be considered advisable for "Interested" to avail himself of the provisions of Part III of the Public Health Act, 1925, and agree with the local authority then doing the work.—LAW.]

Contract Question.

[REPLY TO "PLEASE," MAY 6.]

SIR,—Provided the variations are duly authorised, and carried out in accordance with the terms of the contract, then any error in the priced bills of quantities is, in practice, treated as a percentage on or off the lump sum price, for or against the contractor, as the case may be.

In adjusting the variations on the contract, it is customary first to price out the additions and omissions at the unit prices appearing in the bills of quantities, and then to add or deduct the percentage, above referred to, from the net amount reached being due to the contractor. If, therefore, there is a net addition, and the error gives an additional percentage, that percentage is added. If there is a net omission, then, of course, it is dealt with in the same way and a greater amount deducted from the total due.

On the other hand, if there is a net addition, and the error give a percentage to be deducted, this percentage is deducted. Also, if there is a net omission, then the percentage will be deducted.

In the case in question, it would appear that the error gives a percentage on the lump sum price in the contractor's favour, and he is entitled to that percentage on all net additions contract.

Destruction of Ants.

SIR,—A house built in 1920 is infested with ants. The whole of the ground floor, the larger part of which is oak, is secret nailed to creosoted joists bedded in the site concrete. The ants are particularly active in the larder, which has a quarry tile floor, bedded on the site concrete. We have adopted various methods for remedying, and although each attempt appears to diminish the number, this improvement only lasts for a few days. Central heating and domestic hot-water service are combined, and, except for heating channels where necessary, the whole of the ground floor is solid and on one level. Some of your readers may know of some method by which the pests can be exterminated; if so we shall be very much obliged if they will kindly advise us through your columns. W. G. AND S.

Ventilating Air Space.

SIR,—We shall be glad of your opinion, or that of your readers, as to the desirability or otherwise of ventilating the air spaces between the joists or bearers of asphalt roofs, where such spaces are hermetically sealed by asphalt (laid on boards) on the top of the bearers and a plaster ceiling on the underside. Could you suggest, if considered desirable, a simple method of effecting the necessary ventilation? T. E. S.

Specification Clause.

SIR,—A firm of architects use the following clause in all their specifications:—

"*Generally.* Whether specified or not, whether shown on the drawings or not, everything necessary to make a complete job must be included."

Kindly advise us what is the best thing to do in such a case. BUILDERS.

Ventilating Brick.

SIR,—Some years ago we used with great success a porous red clay ventilating brick in connection with the drying out of a damp wall. The end of the brick was in the form of an equilateral triangle having about 2 in. sides and was about 9 in. long. It had three narrow slots on the front and was built into the old damp wall at an angle falling to the outside. Can you inform us where we could obtain a further supply of these bricks? H. B

London Building Acts.

[REPLY TO "YOUTH," MAY 6TH.]

SIR,—I have had a long experience of these Acts, and am of opinion that no abstract would meet the case, as you have to study the whole of the section applying to the particular matter with which you are dealing. H. L.

Deadening Noise.

SIR,—Recently in a periodical, mats of eel grass—a seaweed which absorbs sound to a remarkable degree—were recommended to be fixed to the walls of a room to deaden noise from traffic outside. Where can eel grass mats be obtained? Would such be useful to cure echo? FRANCISCUS.

A Cotswold House.

This drawing represents a scheme for additions and alterations to an old house in the Cotswolds, and, as will be seen, the local characteristics and materials were proposed to be observed. The scheme has not yet been carried out. Messrs. Baillie Scott and Beresford are the architects.

Church of St. Mary and St. Thomas, Gorton, Manchester.

We regret that through a misunderstanding the example of Mr. Walter Tapper's Royal Academy work which we published in our last issue was wrongly described as the Church of St. Mary and St. Thomas, Gorton, Manchester. We publish the correct illustration this week.

House at Selsdon.

The house will shortly be erected for Mr. D. Martin Wheeler, M.A., on a site at Selsdon, with its principal rooms facing south. The walls will be of Mitchell's grey stocks, with stone-faced dressings and windows. The casements will be iron, filled with lead glazing, by Messrs. Wainwright and Waring; hot water and heating by Messrs. Potterton's, of Balham. The interior will be plain plastered, with brick fires and oak floors.

Mr. Briant Poulter, F.R.I.B.A., is the architect.

Royal Society of British Artists.

At a general assembly of the Royal Society of British Artists the following associates were elected full members of the society: Mr. Hugh Gresty, Mr. John Hodgson Lobley, and Miss Mary McCrossan.

THE BUILDING TRADE

THE LAW OF FIXTURES.—III.

By W. T. CRESWELL, Barrister-at-Law; L.R.I.B.A.; Associate (late Fellow) of the Surveyors' Institution; &c.

Ownership and Removal of Fixtures.

The ownership of fixtures is best determined by considering who has the right to remove them. Questions of ownership, obviously, only arise in reference to those fixtures which have been annexed to the freehold by some other person than the owner himself; excepting, of course, in the cases where an owner has contracted to sell a property as a freehold, and then, before the completion of purchase, attempts to remove certain articles which were on the property at the time the contract was entered into. But where an article is annexed by a limited owner or tenant, the rules of common law apply, viz. (1) that whatever is fixed to the freehold of land becomes part of the freehold; (2) that whatever once becomes part cannot be severed by a limited owner or tenant without rendering him liable for the commission of waste.

The second of these rules has always been modified in practice, more especially in regard to fixtures between a landlord and his tenant, and mostly in favour of the tenant in relation to those articles of (1) ornament and convenience; (2) those fixed for the purpose of trade; (3) agricultural fixtures to a limited extent under Statute. Both (1) and (2) fall into the same category, and both are removable provided that, when fixed, they do not become an essential part of the building, and that their removal does not cause serious damage to the freehold. Further, it must be decided whether or not, if removed, they are capable of being put together again, and in the same form, in some other place; if they can, they are probably removable fixtures.

Where complete buildings are removed, in order to prove that they were fixtures, their removal must be with the object of their re-erection elsewhere, and not merely for the purpose of destruction. Also, when the removal of any building would entail its destruction, it remains part of the freehold. Buildings which are substantially erected are not removable, even though they were originally erected for the purposes of trade.

A tenant destroying these or any other fixtures is liable for waste, and unlawfully to pull them down is a misdemeanour.

A Legal Decision is not an Absolute Authority.

Very few decisions on these matters are absolute precedents, nor are modern decisions governed by old cases; each case has been and must always be decided by a consideration of its own peculiar circumstances.

In Leigh v. Taylor (1902) A.C. 157, Lord Halsbury (C.) said: "We have heard something about a suggested alteration of the law. . . . But the moment one comes to deal with the facts of each particular case, I quite agree that something has changed very much. I suspect it is not the law or any principle of law, but it is a change in the mode of life, the degree in which certain things have seemed susceptible of being put as mere ornaments, whereas at an earlier period the older constructions rendered it impossible sometimes to sever the thing which was put up from the realty. If that is true, it is manifest that you can lay down no rule which will in itself resolve the question, you must apply yourself to the facts of each particular case."

Right to Removal an Exception.

It must be borne in mind that the right to remove fixtures is, if anything, an exceptional circumstance, and before being granted or exercised must be fairly considered, and be clearly defined; and in all cases the points arising create questions of law and fact, for the Court and a jury to decide. For instance, whether a fixture can be removed by a tenant without serious injury to the freehold is a question for a jury arising out of an issue whether the fixture is removable or not by law, the law point being for a judge to determine.

Degree and Object of Annexation.

Speaking generally, the Court will restrain a tenant from removing a fixture, though it will allow him to do so in certain cases, but more as a privilege than as a right

In considering the circumstances of each case, the degree and object of annexation are deciding factors; and it may be said that articles which are not attached to land, except by their own weight, are removable; unless the circumstances of their annexation show that they were intended to be part of the freehold. And the onus of showing that they were so intended lies on those who assert that they have ceased to be chattels. On the other hand, an article which is definitely fixed to the land, even slightly, is considered as part of the land, unless the circumstances are such as to show that it was intended at the time of its annexation that it should continue as a chattel. The onus of proof lies on those who contend that it is a chattel. (See Holland v. Hodgson, 1872, L.R. 7 Cap P 328.)

In Vaudeville, Electric Cinema, Ltd. v. Muriset (1923) 2 ch. 74, it was held that two oil paintings of the nature of frescoes, a patent frame screen fixed by blocks in the wall, four advertising boards fastened outside the hall by screws to the hall posts, and 477 plush tip-up seats, in blocks of four or eight, attached to the floor by iron standards with iron feet, passed under a mortgage as fixtures.

In re Companies Act and Ross and Boal (1924) 1 I.R. 129 C.A., it was held that power-driven sewing machines resting on prepared positions or fixed benches were not fixtures.

Injury to Freehold.

All injury done in removing fixtures must be made good by the party entitled to sever them, for he must leave the premises as he found them; and the same holds good whether the fixtures are set up for agricultural, trade or domestic purposes.

Covenant to Repair.

When there is a covenant in a lease that the lessee shall repair buildings, this covenant extends to the lessor's fixtures if existing at the time of the demise, and to those articles fixed by the lessee during his term; the term "fixtures" here being used in its strict sense; but does not extend to "chattels" which are merely connected with the freehold by a slight or temporary attachment. Also, since a covenant to repair usually not only refers to those premises included in the lease, but also extends to the repair of any buildings which may be erected during the demise, it follows this covenant would also extend to the fixtures comprised in those additional buildings. A covenant to yield up in repair all erections and buildings does not, however, extend to buildings which rest upon blocks or pattens and are erected by the lessee during the term, solely for the purpose of trade and manufacture. (See Naylor v. Collinge, 1807, 1 Taunt 19.)

In Mansfield (Earl) v. Blackburne (1840), 6 Bing N.C. 426, there was a demise of salt springs, and the lessee covenanted to erect works, etc., on the premises, and to pay a rent in proportion to the number of works erected, and to leave the works at the end of the term in good repair. It was held that salt-pans, placed by the lessee on a of brickwork, and used in the boili salt, were such "works"; and tha lessee could not remove them, and th was, in addition, liable for their r This case did not decide whether the pans were movable as "chattels"; did decide was that they were includ the term "works" and came withi covenant "to leave the works at th of the term in good repair." But in fort v. Bates (1862), where there v covenant to yield up at the end of the all works, ways and roads, it was held train plates fastened to wooden sl resting on the soil and used for the p of a railway, were not included i covenant to repair.

Episdem Generis Rule.

In practice, the lessor's fixtures enumerated in the lease, and if an missing during or at the end of the this circumstance should form the basis claim on the lessee for replacement. articles are specified in general words not in particular words, the *episdem ge* rule is applied.

The term *Episdem generis* means "c same kind, class or nature," and is cons as including only all other articles o like nature and quality. The doctri regards fixtures applies when part persons or things having some co characteristics are communicated in followed by general words or a descr comprising the whole of a class. The g words or description will in such a ca construed as only applying to perso things of the same class or nature as already specifically enumerated. (See H v. Elliott 1855 11 Ex 113. and Lam v. McLellan, 1903, 2 Ch. 268.)

Modern Dutch Buildings.

We reprint from the *Times* an inter letter upon this subject from Mr. Ri Graham:—

"During a visit to Holland last n chiefly with a view to seeing the pictu the Mauritshuis and the Rijksmuseum. much impressed by a number of m Dutch buildings. Space forbids that scribe them in detail, but perhaps a general remarks will be of interest. from the fact that the Dutch is the new style of architecture to be see Europe, it is well worth an examinati its own merits alone. The first effect t gives is of sheer, naked starkness. The begins to feel the enormous strength solidarity of the style. And a moment the unique beauty of these new buildi realised. The new Dutch architecture bines elements of Egyptian, Chinese Indian styles, and welds them as one im the Greeks might have done, if they thought or known of these things. The with their sagging curves, deeply ove ing eaves, and curiously ribbed tiles, a tinctly oriental. The accessories and d tions are intriguing and grotesque. are like the heads of Indian totem which have been frozen into horribl rigid shapes by being exposed to th of Medusa, and then been fused int granite of the buildings themselves. B body of the new style of structure is characteristic, and it is this which giv effect of pure and tremendous strengt rectangularity of outline, with narrow windows and stark upright columns, a the force of the style, which is, to r pleasing as it is original. Its develo will be interesting to watch, and unless mistaken, the country which has br forth some of the most beautiful pictu the world will soon be producing so the most striking buildings."

TEMPORARY TIMBER CONSTRUCTION, INCLUDING SHORING—II

By G. A. GARDNER, M.I.Struct.E., Assoc.I.E.E., &c.

the concluding part of the previous mention was made of the effect of tion on the strength of wood, and this ts the desirability of a cursory know- of the structure and nature of wood for concerned with timber construction. hysico-chemical aspects of the subject t pertinent to these articles; and only icro-structure and mechanical properties conifers and oak need be briefly con- d. These matters may be prefaced by remarks as to the supply of timber and nifold uses. Timber is so indispensable tructural material (even the more general ection of reinforced concrete makes ex- e calls on it for form work), and has o lavishly used in the past, that forestry eveloped into a science, and the more vative management of forests has be- imperative in order to safeguard the s supplies. American statistics show, stance, that if the cutting of timber in Continent continued at the present rate uld only take about half a century for gular supplies to become exhausted; but ubt this contingency will be modified he automatic processes of commerce, ng in their train the use of substitutes. is connection synthetic wood might be- a structural material, and then, at last, me-honoured specification clause, calling mber free from "all defects," will be ed!

e conservation of wood supplies is not desirable for structural purposes, but on nt of the large industries connected with products. These industries range from -making and the chemical manufactures ated with wood distillation (producing, example, creosote, wood alcohol, etc.) to the production of such diverse things k stockings and cattle food!

owledge of the micro-structure of timber to an easy appreciation of its mechanical rties. The typical structure of the ers or "soft-woods" differs from that e "hard-woods," such as oak, but the t features are somewhat similar. Fig. 4 a diagrammatic representation of the

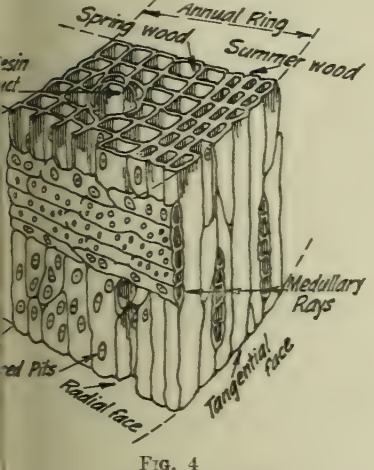

Fig. 4

ture of the conifers and shows the various ents. The regular arrangement of the eides or tube-like cells is a noticeable re; and the belt of narrower cells with er walls, which constitutes the wood ed later in each season, marks out an al ring. These tracheides are very minute are somewhat tapered at their ends where intermesh, the sap being communicated one to the other through funnel-like de- sions called bordered pits, which occur in walls of the cells. Running radially be- n the vertical tracheides are the medullary composed of assemblages of cells whose function is primarily to store food and conduct sap between the bark and sapwood. In certain of the conifers, *e.g.*, pine and spruce, resin ducts occur vertically at intervals among the tracheides and horizontally within some of the medullary rays. These ducts are comparatively large and may sometimes just be distinguished by the naked eye, whereas the other elements can only be made out with the aid of a microscope, there being several hundreds of thousands per square inch. A resin duct is shown in the figure. These, then, are the gross elements of the soft-woods: a study of the structure of the cell walls and other secondary features not being necessary for the purpose of this article.

The arrangement of the cell elements in "hard-woods" (*i.e.*, woods from the broad-leaved or deciduous trees) is considerably more varied and complex than in the conifers; the vertical elements consisting, *inter alia*, of clusters of thick-walled cells called wood fibres, interspersed with groupings of large vessels. In oak these vessels are chiefly grouped amongst the spring wood forming part of each annual ring, and hence the oak is referred to as a "ring-porous" wood. In some other trees, such as the birch, for example, these vessels or pores are dispersed more uniformly throughout the other elements, giving rise to the classification—"diffuse porous" woods. The medullary rays in oak are very much larger than in the common conifers, being readily distinguishable by the naked eye both on the cross-section and vertical radial and tangential sections of the wood.

The cellular structure of wood is responsible for most of the advantages which it possesses as a structural material, viz.: its relative lightness in weight per volume; its toughness or propensity to absorb shock; its holding power on nails; the ease with which it can be worked; its ability to absorb preservatives and retain paint, etc.; but on the other hand its structure seems to be ideal for the insidious attacks of fungi. In this connection a brief study of forestry, the seasoning and decay of timber and its defects, will repay all who employ timber as a structural material.

The behaviour of timber under various stresses must now be considered. When subjected to endwise compression, short rectangular prisms fail by a somewhat sudden buckling or wrinkling of the cell walls or fibres after the specimens have suffered considerable shortening; and in very dry timber longitudinal splitting may also take place. The region of gross buckling often extends at an angle across the tangential face, although practically at right angles to the grain on the radial face, giving the effect of oblique shear—a typical example of such a compression failure being shown in Fig. 5 (i). The reader is referred to a paper entitled "Some Aspects of Timber Construction," read before the Institution of Structural Engineers by the writer, for mention of Dr. Robinson's work (1919) dealing with the microscopic changes in the cell walls during the early stages of failure.

Fig. 5.

The behaviour of timber posts or struts is dependent upon their proportions of length to least cross dimension, and will be dealt with in the next article when considering the practical design of struts. The resistance to pressure perpendicular to or across the grain is very much less than the endwise resistance on account of the collapse of the tracheides under lateral compression, and, unlike the case of longitudinal compression, there is no very definite maximum load beyond which there is an abrupt decrease in strength, but more and more cells become flattened as the load increases. For practical purposes, however, there is a limit of stress up to which the compression of the fibres is proportional to the load (called the limit of proportional deformation) and where the permanent indentation (if any) is slight. In an actual structure under a constant static load the working stress may be allowed to approach this limit; but where live loads have to be carried, as in the

TABLE OF MAXIMUM WORKING STRESSES.

IN POUNDS PER SQ. INCH FOR

TEMPORARY TIMBER STRUCTURES.

Oak	1400	130	200	1430	600

case of a railroad trestle-way, for instance, progressive indentation may result unless the crosswise compression is kept considerably lower. Fig. 5 (ii) shows the indentation in one specimen as the result of a static load, and the greater indentation (iii) in a similar specimen after being subjected to the same load applied fifteen times in succession.

The resistance of structural timbers to tension acting parallel to the grain is greater than that which can be developed under any other kind of stress, and in the case of the conifers is something over twice the ultimate resistance to endwise compression. This strength in pure tension cannot be taken full advantage of in practical structures however, owing to the difficulty of developing the full resistance at the end connections—*cf.* remarks in Part I. The tensile strength crosswise to the grain is, on the other hand, only about a tenth to a twentieth of the endwise resistance; and this is to be expected from the cellular formation and the ease with which wood may be cleaved longitudinally. Pure crosswise tension will not, as a rule, occur designedly in a structure; but in beams where the longitudinal grain runs diagonally, and at points where the grain is diverted by a knot, the flexural tension will be influenced by this crosswise weakness. Diagonal and spiral grained timber will, of course, be prohibited by the specification in the case of important structural work. Fig. 5 (iv) shows a typical longitudinal tension failure of a specially prepared test piece; but sometimes, when the length of the piece is comparatively short, fracture is accompanied by the pulling out of a bundle of fibres, due to a longitudinal shear failure through to the ends of the specimen.

The resistance to shear along the grain constitutes another mechanical weakness, and one which must be carefully guarded against in design; but shear resistance across the grain is seldom a governing factor, since it is considerably in excess of the crosswise compressive resistance and is usually preceded by that kind of failure. The use of hardwood pins or treenails, however, is an instance where resistance to shear across the grain is involved. The limit of horizontal shear resistance sometimes governs the strength of beams, but this will be considered more fully in the next article. Fig. 5 (v) shows a portion of a specially prepared specimen which has failed in longitudinal shear over the radial face of the wood. The failure is similar when taking place over the tangential face, and in specimens free from seasoning checks the ultimate resistance per unit of area is practically the same over both faces.

The table on p. 783 gives the safe stresses which may be allowed in the design of temporary structures, for timber of the grade and "defectiveness" usually met with in temporary work of structural importance. The *real* factor of safety which these stresses signify for static loading will be round about 2, except in the case of bearing perpendicular to the grain, where the pressures given will approach those causing slight permanent indentation—a condition which is allowable only in the absence of a recurring loading, as previously mentioned. The comfortable so-called factors of safety of from 4 to 6, frequently contemplated, have reference to the ultimate resistance of small, clear specimens free from knots, checks, cross-grain and other "defects"; tested by short-time loading under laboratory conditions. These factors, having no real significance as regards the safety of structures generally, nevertheless have a value in the sphere where "Business" meets "Engineering"; but on the other hand they frequently engender the remark: "Why do you make your structures four times as strong as they need be?" The reference above to short-time loading is in contradistinction to the long-time loading which is a condition in actual structures. A test specimen will fail under a load considerably less than that registered in a short-time continuous test, if the lesser load is sustained for a comparatively long time. The writer has, for instance, been able to take tea during the process of failure of a strut under a constant load.

In locations where from one cause or another the wood is constantly in the condition of fibre saturation (*vide* comments in Part I) the basic stresses given in the table should be reduced by about 25 per cent., and a similar reduction ought to be made in cases where re-used, damaged or low-grade timbers are contemplated. The values tabulated for bearing parallel to the grain are for pressures on short prisms, and the precise figures quoted are not significant of any special degree of accuracy but form the index values in some simple formulæ for struts, which will appear in Part III of these articles.

The real structural quality of the several kinds of wood named in the table, will, of course, depend upon a number of variable factors, such as the rate of growth of the trees, the proportion of spring to summer wood, and other conditions not rigidly controlable by commercial grading; but no greater precision is to be expected in this than in the commercial *raming* of the soft woods, which is highly unsatisfactory in its violation of even a pseudo-botanic classification.

(*To be continued.*)

DR. BARNARDO'S HOMES

BUILDING TRADE APPEAL.

We have much pleasure in publishing, at the request of Mr. Frederick Higgs and with the grateful thanks of the whole Committee, the following list of gifts and subscriptions received up to date in support of the building trade effort to provide additional buildings to celebrate the Diamond Jubilee of Dr. Barnardo's Homes. An appeal by Mr. Higgs for this object was published in our issue for March 18.

(1) For alterations and additions to 37, Acacia-road, N.W., the Headquarters Offices of the Collecting Organisation under Miss E. Bentham, Hon. Superintendent:—

Architectural services—Mr. James S. Gibson, F.R.I.B.A.

F. & H. F. Higgs, Ltd., for labour and material supplied...	£511	15	7
Mr. Fredk. Higgs	250	0	0
Mr. F. L. Dove	250	0	0
Sir James Carmichael, K.B.E....	200	0	0
Sir Walter Lawrence	100	0	0
Mr. F. G. Minter...	100	0	0
Mr. H. J. Holloway	100	0	0
Mr. B. I. Greenwood	5	0	0

The following materials have been given free of charge by the undermentioned firms:—

Bricks.—London Brick Co. & Forders, Ltd.; Eastwoods, Ltd; Itters, Ltd.; Hicks & Co., Ltd.: S. & E. Collier, Ltd.; Lugg & Co.

Cement.—Tunnel Portland Cement Co., Ltd.; Associated Portland Cement Manufacturers, Ltd.

Electrical Labour.—Francis Polden & Co.; Cecil Cooper & Co.; Duncan Watson & Co.; Boyce Jackson & Co.

Electrical Material.—Sun Electrical Co., Ltd.; General Electric Co.; British Electric Transformer Co., Ltd.; Metropolitan Vickers, Ltd.; Belling & Co.

Glazing.—Henry Hope & Sons, Ltd.; Geo. Farmiloe & Sons, Ltd.

Flooring.—Bell's Pollite & Everite Co., Ltd.; Art Pavements & Decorations, Ltd.; Diespeker & Co.; Stuarts Granolithic Co., Ltd.

Ironwork.—Mellowes & Co., Ltd.; Burton Foundry Co., Ltd.; Bayliss, Jones & Bayliss, Nettlefold & Sons, Ltd.; Crittall Manufacturing Co., Ltd.; Braby & Co., Ltd.; J. D. Beardmore & Co.; Dorman Long & Co., Ltd.

Paint & Decorating.—Hall & Dixon; Tavener & Son; T. H. Adamson & Sons; John T. Keep; J. B. Orr & Co., Ltd.; Hickman, Ltd.; Cookson Lead & Antimony Co., Ltd.; Mander Bros., Ltd.; Wiggins & Co.; Sir W. A. Rose & Co., Ltd.; Thos. Parsons & Sons; International Paint & Compositions Co., Ltd; Thos. Hubbuck & Sons, Ltd.; Henry Grace & Co.; Nobles & Hoare, Ltd; Sissons Bros., Ltd.

Plumbing & Hot Water Work.—A. G[ibbs] & Sons; Smeaton & Sons, Ltd.; Rich[ardson] Crittall & Co., Ltd.; Locke Lancaster W. W. R. Johnson & Sons, Ltd.

Sanitary Fittings.—Shanks & Co., L[td.]; Valbania, Ltd.; Doulton & Co., Ltd.

Stoves & Heating.—Wilsons & Mathies Ltd.; O'Brien Thomas & Co.; Richmond Stove & Meter Co., Ltd.; Bratt Colbra[n] Co. and the Heaped Fire Co., Ltd.; Range & Foundry Co.; Falkirk Iron Ltd.; John Wright & Co.; Stimex Gas S[tove] Co., Ltd.; Rosser & Russell, Ltd.; Nati[onal] Radiator Co., Ltd.

Tiling.—Alfred Goslett & Co., Ltd.; kington's Tile & Pottery Co., Ltd.; He[nry] Richards' Tile Co., Ltd.; Lea & Boult Carter & Co. (London), Ltd.

Wallpaper.—John Line & Sons, Ltd.; derson & Co.; Heffer, Scott & Co., L[td.] Wallpaper Manufacturers, Ltd.

Woodwork & Timber (Labour).—Du[ll] Tucker & Co.; Stevens & Adams, L[td.] Middlesex Joinery Works, Ltd.; Godso[n] Co.; Rippers, Ltd.; W. H. T. Kellan Sons; Davies Bros., Ltd.

Woodwork & Timber (Material).—Oliver & Sons, Ltd.; Ingram, Perkins & Ltd.; Woco Door Co.; Wm. Mallinso[n] Sons; McGaw & Co.; Churchill & Sim.

Furniture Fittings & Miscellaneous.—Jo[hn] Kaye & Sons, Ltd.; J. H. Sankey & S[on] Ham River Grit Co.; Westminster Wha[rf] Co.; Concrete Aggregates, Ltd.; Lord rhyn's Quarries; W. H. Gaze & Sons; some, Sims & Jeffries, Ltd.; Barfor[d] Perkins, Ltd.

(2) The following sums have been rec[eived] in respect of the proposed new buildings placed on deposit at the National Prov[incial] Bank:—

J. Jarvis & Co.	£262
Mr. W. M. Hill	100
Mr. F. G. Walton	50
Miss E. Bentham	50

The above does not include sundry [small] collections made by various firms. The [cost] of postage in connection with sending o[ut] appeals has been defrayed by Miss Be[ntham] and the cost of printing has been defra[yed by] Mr. George Aldous.

TRAINING OF APPRENTICES IN THE BUILDING INDUSTRY

By SIDNEY STRANKS, Organiser, Amalgamated Union of Building Trade Workers.

[We are glad to print Mr. Stranks's communication, but are not necessarily in agreement with the views expressed.—ED.]

SEVERAL master masons in London during the last few years have become more interested in the welfare and training of mason apprentices, and this has culminated in a new venture which ought to lead to some good results. They have organised examinations for apprentices in theoretical and practical masonry, giving prizes to the students gaining most points. With others, the writer attended the examinations. At least 40 per cent. of the total number of mason apprentices (not marble or monumental) attended. This high percentage would gladden the heart of any director of technical training centre if he could secure it for his own school in less than twelve months. Great credit is due to the London Master Masons' Association for this venture, more especially to Mr. Burlington (of Messrs. Trollope & Colls), Mr. F. Mortimer, and Messrs. Trollope & Colls for lending their premises for the practical examination. The youths who attended were of a good class. Prizes are shortly to be allotted. Similar examinations are to be held every year, and those who have the interests of the building trade at heart will wish every success to this venture.

Immediately after the war, public attention was drawn to the dearth of mechanics in certain building crafts, and a deal of criticism was directed to the trade unions. Their attitude and policy were misrepresented in certain quarters, and the onus for this dearth of labour was thrown on their shoulders. But investigation by Governmental and other impartial departments proved this to be baseless, and that the main cause was the indifference of builders to apprentices. In fact, if they had operated the working rules throughout the country there would have been in 1924 54,000 more apprentices in the building trades. It is a matter of common knowledge that apprenticeship was becoming a dead letter because of this indifference, but it is also true that, while the trade unions can claim to have been more interested, in view of the facts and circumstances they did not adjust their policy and action in a manner to arrest the degradation which took place; and when they have pressed for reform during the last few years their efforts have been frustrated by the prejudice of a section of employers. There are outstanding men among the employers who possess a broader and more intelligent economic outlook on this question, but up to the present these have been practically submerged by those not so blessed.

What have been and what now are the main causes of the degradation of craftsmanship in the building trades? Broadly speaking, certain factors have contributed more and more to the cultivation of a somewhat materialistic outlook, which is the biggest obstacle to the training of a good self-respecting craftsman. The spirit of Ruskin, Morris and others, combined with something of the spirit of the old Guilds, or even that of the master craftsmen who succeeded the Guilds, must be imparted into any modern scheme of apprenticeship before we can achieve better results. Employers and operatives are governed largely by considerations of personal economic factors, but surely with all the progress we pride ourselves on having achieved, and the educational advantages we enjoy, our minds ought to find room for things of a higher order. Cultivation of real pride in craftsmanship ought to find a corner in our thoughts and policy; if not, then it is an admission of incompetence which will bring its own reward in perpetuating the present conditions.

Why have employers neglected to carry out their responsibilities, *i.e.*, recruiting the ranks of mechanics through a proper system of apprenticeship? In the first place, some of them appear to have lost the inspiration of our forefathers, who, though possessed with a desire to gain economic advantages, also had a keener interest in their crafts, which was largely due to the fact that most, if not all, had gravitated to master craftsmen by being journeymen. Hence they had more respect for their craft. Modern conditions are entirely foreign to the past. Joint stock companies, and employers who have had no real and direct contact with crafts, dominate the destinies of the building trade. Many of these have little regard for the industry apart from profit. Their foremen, who have experience and knowledge of craftsmanship, are governed by these powers, who give them little opportunity to render that valuable service to the industry that it needs. This class of employer is gradually becoming a mere receiver. On many of our large contracts we find boards up with a list of names of sub-contractors for practically everything; in addition, we come across cases where work is let to mere piece-masters. These factors encourage irresponsibility so far as the interests of the industry are concerned. Many of them have no time for apprentices. Again, on the operatives' side there is much to be desired. Insecurity and bad conditions of employment, machinery, substitutes, scamping of work, and changes in modern building construction have all tended to destroy respect for real craftsmanship. A change must be effected. The trade unions in future must accept more responsibility.

In 1919-20 some of us who were members of the Industrial Council for the Building Industry thought something substantial would be done by way of reform to place the apprenticeship system on a different plane, but all efforts were impeded by the ultra-reactionary forces then existing. The Council was dissolved and the proposed scheme for apprenticeship practically went by the board. I am not so conversant with what has been done in other regions: but in London I can speak with some authority. In 1917 the Building Trades Apprenticeship Committee was established, comprising representatives of the Institute of Builders, the London Master Builders' Association, the Central Advisory Committee for Juvenile Employment, the Building Trade Unions, and Local Education Authorities. This, I venture to say, was a good body, though I wish that architects and general foremen and clerks of works had been included. This body established a scheme, which fixed wages of apprentices, provided a model indenture form, and embraced a system of continuation of technical education for apprentices up to a certain age by stipulating that they should be allowed to attend appropriate schools two half-days each week. This committee had a chequered career, and in spite of the combined efforts of its members, it received such scant treatment by the builders that it was dissolved either the end of 1925 or the early part of 1926. There are 3,200 building firms in London, yet in spite of the pronounced dearth of mechanics, the desperate efforts to place apprentices, and a long waiting list of boys to fill any openings, only 220 were placed, the majority of this small number being taken by eight firms. What a record!

The reasons given by the builders for the failure of the committee referred to were the governmental influences upon it and its educational provisions. I could never see these as being sufficient to destroy such a venture. It was clear in 1924 that this committee was doomed. The London master builders and trades unions in the autumn of that year, as an expedient, agreed to relax the apprentice rule on the understanding that they would proceed to negotiate new provisions for future guidance. We have been negotiating intermittently from then to the present time, and now there seems a prospect of agreement; but while I am pleased at this, it is disappointing to feel that a model scheme of indentures, to be drawn up, is not obligatory. Hence the progressive firms will apply it, but those whose records are defective will probably ignore it. The control of the scheme is to be vested in a joint committee of representatives of the L.M.B.A. and the Trade Unions. One can only express an earnest hope that better results will follow its operations. Since 1924 the Wheatley scheme for the augmentation of craftsmen on housing schemes has been operated and has tended to increase the personnel, but in many cases there was no enthusiasm for apprentices from builders as a whole. Some are not particularly grieved at this, it being argued that there is not the scope on such works to train a mechanic properly. In addition to the apprentices put to the various trades through agencies referred to, other boys have been apprenticed by firms. But the man power of some trades has also been increased, *e.g.*, bricklayers, carpenters and plasterers, by dilution. More especially is this the case in bricklaying; among bricklayers who respect their craft, and among employers and foremen the number of bricklayers whose craftsmanship is of a distinctly low standard is a matter of common complaint. The sole reason for this is that in certain quarters employers have engaged adults who either have been too old to adapt themselves to the methods essential to train an efficient mechanic, or the employer has entirely ignored his responsibility irrespective of class of workmanship so long as the building was erected in some shape. In my own Union it is surprising the amount of time my colleague and I have to devote to our branches owing to the concern of our bricklayer members regarding applicants for membership whose craftsmanship is questioned on account of the factors stated. The facts and circumstances regarding this question are sufficient to cause serious reflection. Is it too much to expect a revival of the spirit of the past? Cannot we, with the combination of advantages that this generation possesses over those of our forefathers, do something to establish an intelligent scheme of apprenticeship? I think it can be done.

The first essential is to raise all considerations of apprenticeship beyond the conflicting interests of employers' associations and trade unions. We must look upon the youths in our industry as being a joint trust, their welfare being a first claim. It is our business to direct, encourage and stimulate, and by every means possible assist them to achievement in their occupation. The combined knowledge and experience of all interested in the building trade should be placed at the disposal of any body established to deal with this question.

I would suggest that a committee competent to promote an efficient system of training for our future craftsmen should embrace representatives of the following bodies: the London master builders, trade unions, architects, clerks of works and foremen, and technical education agencies. The function of such a body should be to compile exact information as to apprentices and their needs—theoretical and practical—to secure their confidence by promoting educational and recreative gatherings. From the time the boy is committed to our care, his whole welfare should be our concern. This may appear to be idealistic, but let us examine the question to see what can be done. Indifference and passivity are of no use.

Rebuilding of Zeebrugge Mole.

The Belgian Cabinet has decided to ask Parliament for the necessary funds to replace the existing Mole at Zeebrugge by one built on arches.

BUILDERS' CLERKS BENEVOLENT INSTITUTION DINNER

The 47th annual dinner in aid of the funds of this Institution was held on 4th May at the Holborn Restaurant, under the presidency of Mr. F. D. Huntingdon. Over four hundred guests were present, and during the evening it was announced that £521 19s. had been collected for the funds of the institution

The loyal toasts having been honoured,

The President, in giving the toast of "The Builders' Clerks' Benevolent Institution," said that he had found one had to earn any privilege, and that one of his jobs as President was to collect a certain sum of money, while the other was to make a speech. It was said that the employer did not appreciate the services of the builders' clerk, but in his own case it was not so He was in a position to appreciate to the full the clerk's services. The President then sketched shortly the life of the average builders' clerk—designated as "Jones"—his trials, training, responsibilities. Eventually, said the President, he would arrive at the position of estimator, because he was a very good lad, and finally at the position of chief clerk or office manager. Perhaps then his health broke down, and the hand of the Institution came to brighten his weary lot. On behalf of "Jones," he would say, "God bless them for their generosity."

Mr. James Boyce, in proposing the toast of "Architects and Surveyors," said that for 30 years his work had lain amongst them. Builders had all been taught that "architects began the trouble and surveyors completed it." But he knew that every builders' clerk there that night appreciated to the full the presence of every architect and surveyor. He had pleasure in giving the toast, coupled with the name of Mr. G. H. Hadland.

Councillor Pulley, F.R.G.S., Hon. Treasurer, then gave the toast of "Builders and Builders' Merchants," in which he thanked them for their support, which was always generously, consistently and willingly given to the Fund. The Fund had given out no less than £25,600 in pensions and over £1.000 in temporary relief. They had paid out £800 in educating orphans of builders' clerks, and last year they had been able to increase their pensions. It was only right that the builder should make provision for his clerks when they were ill or past their work. But what of the builders' merchants, who had no contact with the clerks? Yet year after year builders' merchants contributed generously to the funds with which the work was carried on.

Mr. A. H. Adamson, F.I.O.B., replying, said he looked upon the merchants as the cement which bound the industry together. There were no people who supported the industry more loyally than the builders' merchants. If the industry could pull together, setting country first and itself second, then the industry could but further prosper.

Mr. R. L. Roberts, in proposing the toast of "The President," said that he had known him for many years, and thought that if he brought the same charm to the Institution as he brought to his various other activities, then the Institution would be a fortunate body. He would not prolong his speech further, but would ask them to drink to the health of the President, an action that was very heartily rendered.

The President then replied briefly, and the proceedings terminated with some enjoyable musical items.

Monastery Ruins Find.

Workmen excavating on the site of the ruins of Greyfriars Monastery at Cardiff have discovered three stone arches and a number of human skeletons. The history of the stonework and the remains is at present unknown, and the Marquis of Bute has given instructions that nothing is to be disturbed until an expert has been called in.

NEW BUILDINGS IN LONDON

Beckenham.—Cinema.—A cinema capable of accommodating 2,000 persons is to be built at Beckenham to the plans of Mr. Robert Cromie, F.R.I.B.A., 73, Edgware-road, W.2. The contractors are Messrs. Fleming, Reynolds and Co., 66, Tyrwhitt-road, Brockley.

Becontree.—Housing Scheme.—It is proposed by the London County Council Housing Committee to proceed with the development of a further section of the Becontree estate at an estimated outlay of £1,270,000. The area concerned extends to about 147.25 acres, and it is proposed to erect thereon 2,221 houses and flats, of which about 134 will be of timber construction. Sites on this section have been reserved for a school and two churches.

Bermondsey.—Bungalows.—The Borough Council is to proceed with the building of 17 bungalows by direct labour. Plans have been prepared by Mr. H. J. Hills, the Borough Surveyor.

Bow, E.—Hall.—Mr. C. Cowles-Voysey, A.R.I.B.A., 14, Gray's Inn-square, W.C.1, has prepared plans for "Kingsley Hall," Bow, E. The general contractors are Limpus and Son, Kingston-hill, Surrey.

Church-street, W.—Shops and Flats.—On a site next the Roman Catholic Chapel in Church-street, Kensington, it is proposed to erect a block of flats with shops below. The building contract has been let to Messrs. Leslie and Co., Ltd., of Kensington-square, W.8. Messrs. Wills and Kaula, 3, Southampton-street, W.C.1, are the architects.

Croydon.—Hospital.—The governors of Bethlem Royal Hospital have decided to proceed at once with the erection of their new building on the Monks Orchard estate at Shirley, near Croydon. Tenders are to be invited for the first portion of the new hospital. Mr. John Chesterton is the architect.

Edgware-road.—Garage.—On an extensive site in Edgware-road, next the L.C.C. Fire Station, Messrs. F. and H. F. Higgs, Ltd., are the builders for a garage and supply station. Messrs. O'Donoghue and Halfide, 3, Staple Inn, W.C.1, are the architects.

Edmonton.—School.—Plans for a middle-class girls' school to be erected on the north side of the gas company's offices have been approved (subject to certain amendments) by the U.D.C., and will now be forwarded to the Board of Education.

Muswell Hill.—School.—The Hornsey Town Council have been informed that the Board of Education has approved plans for the proposed Coldfall School to be erected in Muswell Hill at a cost of £36,800. The architect is Mr. H. Carter Pegg, F.R.I.B.A., 35, Parliament Street, S.W.1.

Oxford-street.—Reconstruction. — Extensive structural alterations are to be carried out to Messrs. Swears and Wells' premises at 374, Oxford-street, W. There is no architect for the work, the contract for which has been obtained by Samuel Haskins and Bros., Ltd., Walthamstow.

Primrose Hill.—Telephone Exchange.—On a site at Primrose Hill, N.W., H.M. Office of Works are proposing to erect a telephone exchange. Tenders are now being invited.

South Kensington.—Conversion.—Messrs. Austin, West and Co., of 13, Victoria-street, S.W.1, are making structural alterations to 159-163, Lexham-gardens, Cromwell-road, S.W. The premises will be used as an hotel. The constructional steelwork is being supplied by Messrs. Young and Co., 6, Queen Anne's-gate, Westminster, S.W.1. The architects are Messrs. Williams and Cox, 34, Henrietta-street, W.C.2.

Stamford-hill.—Cinema.—On a site in Stamford-hill, N., the Provincial Cinema Theatres, Ltd., propose to erect a large cinema. Plans are to be prepared by the company's architect, Mr. W. E. Trent, at their offices, 123, Regent-street, W.1.

Twickenham.—Cinema.—Mr. Joseph T Mears, 5, Hill-street, Richmond, is in negotiation with the Twickenham Borough Council for the purchase of a site at Richmond House for the erection of a cinema Should he be successful, it is thought likely that Messrs. Granger and Leathart, 2 Adelphi Terrace House, W.C.2, will be asked to prepare the plans.

Willesden.—Kinema.—The Empire Kinema is to be reconstructed to the plans of Mr Cecil Masey, L.R.I.B.A., Devereux Court W.C. A balcony seating 800 persons is to be added, and a full stage and plenum ventilating system are to be installed. The contractors are Messrs. Kirk and Kirk, Ltd. of Putney.

Wimbledon.—Swimming Baths.—The B.C are to apply for sanction to a loan of £1,50 for the acquisition of Nos. 13 and 15 Latimer-road, for purposes of a swimming bath, plans for which are being prepared by the Borough Surveyor, Mr. Bowen.

LAW REPORT

NON-PAYMENT OF HEALTH AND UNEMPLOYMENT CONTRIBUTIONS.

A case of interest to builders and contractors was heard at the Clacton-on-Se police court recently, when Frank Hewa Shreeve, a builder, of Great Clacton, pleade not guilty to 16 summonses of failing to pa health and unemployment contribution an with failing to return insurance cards to me employed by him. Mr. L. J. Organ, Distri Inspector of the M.O.H. Insurance Depar ment, prosecuted, and Mr. Kenneth Ellio defended.

For the defence it was stated that Shreev was not the employer of the men but onl a foreman, and that Mr. H. A. Farman, f whom two houses were being built, was th real emplcyer. Evidence was given by bricklayer that when the defendant engage him he said he was the foreman on the jo and witness understood that Mr. Farman w the employer.

Mr. H. A. Farman, of Bull Hill, Great Cla ton, gave evidence that he had a verbal co tract with the defendant, who engaged th labour. He (witness) had never employe one of the men on the works, and there w no contract of service between him and d fendant.

In the witness box, defendant said he d not regard himself as a contractor; he w nothing else but a workman obeying instru tions, and he paid the men at the week-en with money received from Mr. Farman.

The bench decided that defendant was th employer of the men on the first charge, an defendant then pleaded guilty to the oth charges. He was fined £2 on the first charg and 5s. on each of the others, and ordered t pay the arrears of contributions and cost the total sum to be paid by the defenda being £19 13s. 1d.

Dorman, Long Travelling Scholarship.

We have received from the Institution Structural Engineers, particulars of th scholarship, of the value of £30 which will be awarded triennially commencing in 1928. Its object to encourage and develop the know ledge in Great Britain of steel-frame con struction. Candidates eligible for entry a members (in any class) of the Institution Structural Engineers. Particulars of th scholarship may be obtained on applicatio to the Secretary of the Institution, M Maurice G. Kiddy, 10, Upper Belgrav Street, S.W.1.

THE WEEK IN PARLIAMENT.

Westminster, Wednesday.

The Price of Houses.

r. Chamberlain informed Mr. H. Williams the average price of parlour-type houses uded in contracts let by local authorities ng the three months ended in March last £490, as compared with an average price 513 for the previous December quarter, re the decision to reduce the subsidy.

The Subsidy.

r. Thurtle asked the Minister of Health if was aware that both the housing com-ee of the London County Council and Manchester Corporation had recently re-ed that they had not discovered any uction in prices tendered for the building houses following the publication of his r giving notice of certain reductions in housing subsidy; if he had any evidence how that the reduction in tender prices ch he anticipated had taken place; and, ot, would he, in view of the urgent need houses which still existed, consider the tion of reducing the subsidy.

r. Chamberlain said that according to rns furnished to his department by local norities, no contracts for the erection of idy houses under the Housing Acts of 5 and 1924 had been let by the L.C.C. e the date of the publication of the order ucing the housing subsidy, and it was therefore, possible to make a com-son in the case of this authority. As rded Manchester, prices of houses in-led in contracts let in January last were per superficial foot less for non-parlour, 3d. per superficial foot less for parlour-houses than prices obtained for houses October last. As regarded the country erally, the average prices of non-parlour ses in contracts let by local authorities ing the quarter ended last March was 5, as compared with £448 for the quarter ed December, 1926, and £443 for the rter ended September, 1926. It would seen that these figures afforded no ground reconsidering the decision to reduce the idy.

Rent Restriction Act.

ir Walter de Frece asked the Minister of lth whether, to facilitate public con-ience, he anticipated being able to state Government policy on the future of the t Restriction Act before Parliament was rogued for the summer recess.

Ir. Chamberlain: "Yes, sir."

Water Pipes.

ir H. Nield asked the Minister of Health ether, in view of the altered conditions of dern building and estate development, he ld consider the hardship produced by a tinuance of the Metropolitan Water rd's policy of placing mains down one side a road or street only, thereby forcing the ers of property on the opposite side to liable for maintenance of about 30 feet of rice pipe, against about six feet on the n side, while having no control either of main or over the road; and whether he ld consider the advisability of promoting slation to vary Section 8 of the Metro-tan Water Board (Charges) Act, 1907, so o transfer to the Board the cost of main-ing the difference in length of the service exceeding six feet from the boundary he premises served?

r. Chamberlain: This question was not aliar to the Metropolitan Water Board, he was referring the matter to the isory Committee on Water for their con-ration and advice.

The Purchasing of Council Houses.

r. Hore-Belisha asked the Minister of lth whether he would consider the rability of introducing legislation reby tenants of Council houses who ed to purchase their houses might be bled to do so.

r K. Wood said that local authorities ady had power under the Housing Act, 1925, to sell houses erected by them, and a number of local authorities had adopted schemes for the sale of houses to tenants and others. It did not appear that further legislation on the point was necessary.

Output of Bricks.

Mr. Betterton informed Sir John Power that the output of bricks in Great Britain in 1926 was estimated at about 6,000 millions, which, allowing for Sundays and holidays and the half-day on Saturday, would be about 21½ millions for each full working day. The number of insured bricklayers in the building trade in July, 1926, less those recorded as unemployed, was about 64,000. There were no precise statistics as to the number of bricklayers employed in other trades, which, however, was considerable.

Lead Paint Regulations.

Sir W. Joynson-Hicks, Home Secretary, informed Mr. R. J. Davies that the Shipbuilding Employers' Federation had objected to the application of the draft regulations to the painting of buildings in shipbuilding establishments on the ground that the persons employed in such painting were only occasionally so employed. The painting of ships was not in question, as the Act of last session only applied to the painting of buildings.

A Kensington Widening.

In reply to Mr. Ponsonby, who asked a long question as to the area of land to be surrendered for the proposed widening of Kensington High-street, Colonel Ashley said that he understood that approximately 16,700 sq. ft. was to be surrendered for the proposed widening, made up as to 10,000 sq. ft. by the private firm and 6,700 sq. ft. by the Crown. The area of public street to be surrendered to the firm was approximately 13,500 sq. ft., subject to the necessary Order by the appropriate Court being obtained.

Loss on Addison Houses.

Mr. Chamberlain informed Lt.-Col. Horlick that the average annual loss per house in respect of houses erected by local authorities under the terms of the 1919 Act was estimated at £46 per annum. The rents of those houses, which had been fixed in accordance with rules made under the Housing Act, 1919, were brought under review from time to time.

Price of Building Materials.

Mr. Chamberlain informed Mr. Day that the following table gave information as to the published prices of the principal building materials in London in the spring of each of the years in question. It would, of course, be appreciated that prices varied in different districts:—

Material.	Unit.	1913	1919	1926
		£ s. d.	£ s. d.	£ s. d.
Bricks (best stocks)	per 1,000	1 16 0	3 6 0	4 3 6
„ (Flettons)	„ 1,000	1 14 0	2 9 5	2 13 3
Pit Sand	„ yard	6 9	16 0	13 9
Thames Ballast	„ yard	5 6	17 0	10 6
Best Portland Cement	„ ton	1 16 0	3 8 0	2 18 0
Blue Lias Lime	„ ton	19 0	2 2 6	2 4 6
Slates (20″ × 10″)	„ mille	13 2 6	27 10 0	25 12 6
Tiles	„ 1,000	2 2 0	6 2 6	5 12 6
Timber (3″ × 7″)...	standard	12 10 0	43 10 0	20 0 0
Lead (Sheet)	per ton	19 17 6	41 0 0	44 10 0
White Lead	„ ton	28 5 0	66 0 0	54 5 0
Glass (21 oz. 4ths)	„ foot	3	8	4½

Rural Houses.

Sir K. Wood informed Mr. T. Williams that, since the Armistice, 132,226 houses had been completed in 590 rural districts under the various Housing Acts.

London Bridges.

During a debate on the Transport Ministry, Col. Ashley, the Minister, read a letter which the Prime Minister had recently written to the L.C.C. in regard to the London bridges, stating that the Government desired every party to proceed at once with the suggested inquiry into the financial, engineering, and other aspects of the scheme for the erection of a double-decked bridge at Charing Cross. There was no reason why the proposed investigation should not very shortly begin.

Quality of Timber.

Captain Garro-Jones asked the Minister whether he had had his attention drawn to the poor quality of timber recently used in the construction of houses subsidised by the Government?

Sir K. Wood said that the Minister's attention had been drawn to a newspaper article on that subject, but cases of complaint reaching him in regard to subsidised houses had been extremely rare. One of the conditions of grant approved by the Treasury required that the materials used must be of good quality, and the surveyor or other authorised officer of the local authority had to certify, *inter alia*, that the houses had been constructed in compliance with the requirements of this condition. The Minister had no doubt that the officers of local authorities performed their duties with care in this matter.

Cost of Army Houses.

Mr. Robinson asked the Secretary for War if he would state the average cost per house, and the number of rooms per house, in the Salisbury Plain, Avon Valley, cottage housing scheme in the year 1926 and the current year; and whether the building was being done by direct labour or under contract?

Sir L. Worthington Evans said that the average cost of those houses which contained a living-room, scullery, and three bedrooms, was £490 in 1926, and it was estimated that the cost would be approximately the same during the current year. The building was being done by direct labour.

Nag Hamadi Barrage Contract.

Tenders for the construction of the Nag Hamadi barrage were opened last Tuesday week. The lowest was that of Sir John Jackson, Ltd., at £2,026,036. The proposed dam will be a work of great engineering magnitude, somewhat similar in dimensions to the dams at Assouan and Sennar, and is, of course, being undertaken for the Egyptian Government. Sir John Jackson, Ltd., were responsible for the Hindia barrage on the Euphrates, near Bagdad. Nag Hamadi is on the Nile, some 40 miles north-west of Luxor.

Weir Houses.

In reply to a question as to a fire which had taken place in some of the Weir houses in Scotland, Mr. J. Gilmour said that in the further contract for 1,000 houses of that type, to be entered into by the Second Scottish National Housing Co. (Housing Trust), Ltd., arrangements to minimise the risk of fire were being made in the light of experience gained.

(For rates of wages in the Building Trade in Scotland, see page 793.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

A New Beet Sugar Factory.

Messrs. Perry and Co. (Bow), Ltd., have secured the contract for the erection of a beet sugar factory at Allscott, near Wellington, Salop. The scheme provides for the putting in of railway sidings from the main G.W./L.M.S. joint line. There will be 27 buildings apart from the main sugar works, the dimensions of this building being 300 ft. by 100 ft. by 75 ft. high. The main form of construction provides for steel framed buildings, concrete blocks, floors, etc. The remaining buildings include power house, boiler house, sugar stores, pulp drying plant house, pulp shop, repair shop, lime, coke stores, lime kiln, offices, loco shed, garage, gate house, various stores and discharging stations. The estimated cost of the completed works is approximately £460,000. Messrs. Fraser and Chalmers, of Erith, will supply most of the machinery and production plant. The consulting engineers for the Shropshire Beet Sugar Co., Ltd., are Messrs. Heron Rogers and Pettit.

THE TRADE DISPUTES AND TRADE UNIONS BILL

WE notice that at a conference of Working Class Associations recently held, Sir Henry Slesser severely criticised the Trade Disputes and Trade Unions Bill, but we only intend to touch upon two or three of the points he raised. Referring to clause 1 of the Bill, he took exception to the fact that it made no distinction between a strike in breach of contract and a strike after due notice, and he is reported as having said that the effect of the Bill was to put the individual workman back into a state of slavery tied to a particular employer after giving notice to terminate his contract. If Sir Henry was correctly reported, we fail to understand how such a statement can be supported by the Bill. The Bill does not make illegal any strike within the trade or industry in which the strikers are engaged in furtherance of a trade dispute connected with the employment or non-employment or with the terms of employment or conditions of labour of persons in that trade or industry. A strike is only illegal if it is designed or calculated to coerce the Government or intimidate the community or any substantial portion of the community. Therefore, we fail to see how the liberty of the individual workman as regards his employer is in any way affected or how he becomes tied to any particular employer. If the intention of the strike is to coerce the Government or to intimidate the community, it does not matter whether it takes place in breach of private contracts or after their termination, and the private breach of contract cannot be material.

A much more weighty criticism was contained in Sir Henry's observation that he could not see how it would be safe to carry on any strike in any industry that could be called a sympathetic industry without the gravest peril. As the Bill is drafted, the position of a sympathetic strike simply undertaken to assist workmen in another industry to secure better terms from their employers is obscure, but on the whole we incline to think the effect of the Bill is to render a sympathetic strike illegal. Clause 1 says that any strike having any object besides the furtherance of a trade dispute within the trade or industry in which the strikers are engaged is an illegal strike if designed or calculated to coerce the Government or intimidate the community, and that for the purpose of the foregoing provision a trade dispute shall not be deemed to be within a trade or industry unless it is a dispute between employers and workmen, or between workmen and workmen in that trade or industry which is connected with the employment or non-employment or the terms of employment or with the conditions of labour of persons within that trade or industry.

The difficulty arises in this way. The clause is primarily aimed at making illegal a strike which is calculated to coerce the Government or intimidate the community, but it is so drawn that it may be said that if a strike takes place in an industry allied to one in which a strike is in progress concerning wages conditions, that, in itself constitutes coercion or intimidation, although the object of the sympathetic strike is only to assist the workers in the first industry to adjust terms of employment with their employers. It would, in fact, rather appear to be a question of degree as to whether the sympathetic strike had that effect, but this would involve a legal question being decided whilst a strike was in progress. The whole clause needs careful consideration in Committee to obviate doubts whether a sympathetic strike comes within the clause at all without proof that its object is coercion or intimidation, or whether it is made illegal to declare such a strike.

In another passage in his speech, Sir Henry Slesser was reported as saying the proposal as regards the political fund brought about the repeal of the existing rights of trade unions, when they had taken a ballot, to carry on political action, but we do not quite follow this observation, for as we understand the Bill it only prevents the unions from carrying on their political action out of the pockets of those members who do not desire to contribute to those political objects.

ROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work ore plans are finally approved by the local authorities, "proposed" works at the time of blication have been actually commenced. STOCKPORT.—Plans approved by T.C. included: Alteration of a portion of the Bishop Brown Memorial Boys' school, High-st., into a club. Continuation of Sherborne-rd., Birchfield-rd. and Heathside-rd. Continuation of Buckingham-rd. and erection of 5 houses. Three detached houses, Alexandra-rd. Extension of works, Marriott-st., for R. Bailey & Son, Ltd. Bakehouse at rear of Nos. 164 & 166, Northgate-rd. Also for 8 subsidy houses, Birchfield-rd., and 10 at Nangreave-rd.

STOKESLEY.—Plans passed by the R.D.C.—Six houses at Worsall-road, Yarm., for S. Bardsley.

WALSALL.—At a meeting of Walsall R.D.C., the Clerk stated that he had received an intimation that the M.H. would pay the subsidy in respect of 40 houses to be erected at Rushall. Sanction was given to the borrowing of £800 to meet the cost of acquiring the site.

WHITEFIELD.—U.D.C. are to build an additional 38 houses under the Wheatley Act.

WIGTON.—Plans were passed by R.D.C. for a new farmhouse at Nealhouse, Thursby, for J. Jardine.

Housing Subsidy Cut.

Sir Kingsley Wood (Parliamentary Secretary to the Minister of Health), speaking at a luncheon following the annual meeting of the Metropolitan Building Societies at the Holborn Restaurant, said that the great need was for houses to let at rentals within the reach of the poorer classes, and the dominant intention of the Government in making the very modest cut of £25 in the subsidy was to bring prices down. His experience had been that the higher the subsidy the higher the cost of the house. What was called the "Addison" house, which carried the largest subsidy of all, cost £1,000. By December, 1922, in a non-subsidy period, the cost of a non-parlour house had fallen to £546. By December, 1923, when the Chamberlain Act gave a reduced subsidy, the cost of the same type of house had increased on the average by £68, and another £26 was added after the Wheatley Act, with its larger subsidy. On the other hand, it was a fact that prices had come down appreciably since the cut in the subsidy was announced, for whereas the price in October was £453, in November £422, and in December £463, in January the figure was £427, in February £424, and in March £422—giving an average drop that was very nearly equal to the amount of the subsidy. As matters stood, if prices remained constant, there was no reason why the number of houses built in the coming years should not equal the preceding year's record.

Sewage Disposal Works, Dodworth.

The new sewage disposal works at Dodworth, which have been under construction for the past fifteen months, are now completed and in operation. The total cost of the works is about £7,000. Provision has been made for 5,500 population, the present population being now about 4,000. Messrs. W. H. Radford &. Son, of Nottingham, are the engineers of the scheme, and Messrs. J. Bentley & Co., of Radford, the contractors.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Aberdeen.—HALL.—Plans passed:—Dance hall and lounge at Beach Esplanade for the Town Council, also Variety Pavilion and 8 shops, 5 houses at Ashley Park-drive for Messrs. D. & J. R. McMillan.

Airdrie.—HOUSES.—The Town Council has decided to erect an additional 160 flatted houses at Whitehall estate.

East Lothian.—SCHOOL.—A new infant school is to be erected at Tranent at a cost of £15,474, and additions to Dunbar Secondary School are to be proceeded with at a cost of £6,812.

Fraserburgh.—GAS WORKS.—The T.C. is considering a scheme for the erection of new gas works at an estimated inclusive cost of £20,000.

Glasgow.—CINEMA.—Contracts are shortly to be placed, we understand, in regard to the construction of the new cinema in Maryhill-road, Glasgow, for Messrs. Blythswood Picture House, Ltd. The architect is Mr. C. J. McNair, 112, Bath-street, Glasgow.

Glasgow.—CINEMA.—Plans for the proposed new cinema in Summerfield-street, for the Strathclyde Cinema, Ltd., 163, Vincent-street, Glasgow, now before the local authorities, show a building of almost 3,000 seating capacity on a site area 120 ft. by 90 ft. The architects are Messrs. Gardner and Glen, 164, Bath-street, Glasgow.

Glasgow.—VARIOUS.—Plans passed:—Substation at Kirk-street, for the Electricity Department, and extension of Knightswood Hospital for the Public Health Department; Hall at Corbett-street, Tollcross, for Trustees for the Salvation Army; 12 houses and 2 villas at Ellangowan-road and Maunering-road, for Messrs. J. Adam & Co.

Linlithgow.—SCHOOL.—Scheme for a school for Catholic children, to be erected at Bathgate, is being undertaken by the Linlithgowshire Education Authority. The school is to have accommodation for 920 pupils.

Peterhead.—GENERATING STATION.—The T.C. has agreed to give the Electric Supply Corporation, Ltd. a site in Ugie-street for the erection of a generating station, subject to the consent of the Electricity Commissioners.

Renfrewshire.—HOUSES.—Plans passed:—28 houses at Deanwood-avenue, Muirend, for Messrs. J. Dickie & Sons, Muirend.

Edinburgh Cenotaph.

A meeting of the Edinburgh Citizens' Cenotaph Committee was held recently in the City Chambers, Lord Provost Stevenson presiding. Colonel Robertson moved that the offer of the Town Council to place the memorial in the central arch of the façade of the City Chambers facing High Street be approved; that the memorial should take the form of a replica of the Stone of Remembrance erected in all the British cemeteries abroad by the War Graves Commissioners; and that the design and work of erection be subject to the approval of the city architect and burgh engineer. Dr. M'Laren Shiels seconded, and the motion was unanimously agreed to.

Incorporation of Architects in Scotland.

The monthly meeting of the Council of the Incorporation of Architects in Scotland was held at 15, Rutland Square, Edinburgh, Mr. G. P. K. Young, F.R.I.B.A., president, in the chair. One Fellow, four Associates, and six students were elected. Intimation was made of the Chapter representatives and vice-president elected for the ensuing year. Approval was given to the programme drawn up for the annual Convention, which is to be held at Elgin on June 3 and 4. The Education Committee submitted the awards under the Rowand Anderson Studentship.

BUILDING TRADE WAGES IN SCOTLAND.*

NEW COMPANIES

The particulars quoted below have been ompiled by Messrs. Jordan & Sons, Ltd., ompany Registration Agents, of 116 & 117, hancery-lane, W.C.2, from the documents ailable at the Companies' Registry.

B. Peck & Co., Ltd. (220,184). Registered arch 10.—59B, Upper-street, Islington, N.1. uilding contractors and plumbers, &c. Nominal pital, £500.

Arthur Marshall & Co., Ltd. (220,183). egistered March 10. 2, Walbrook, E.C.4. uilders and contractors, &c. Nominal capital. 5,000.

Collett Brothers, Ltd. (220,189). Registred March 10. 10, Reginald-terrace, Chapel, own-road, Leeds. To acquire any lands uildings and hereditaments and any estate or terest therein; to prepare building sites, &c. ominal capital, £1,000.

Wates Streatham (1927), Ltd. (220,179). egistered March 9. 82 and 84, Mitcham-lane, reatham, S.W.16. Builders and contractors, c. Nominal capital, £5,000.

Flower & Fraser, Ltd. (220,161). Registred March 9. 141, New Bond-street, W.1. uilders, contractors and decorators, &c. ominal capital, £2,500.

Thos. Foster & Sons, Ltd. (220,144). egistered March 8. L.M. & S. Railway Goods epot (Midland Section), St. Pancras, N.W.1. le merchant and factor. Nominal capital, 0,000.

Reliable Jointless Flooring Co., Ltd. 20,141). Registered March 8. 314, Upper ichmond-road, S.W.15. Manufacturers of a oring substance known as "Jointless Floor-g." Nominal capital, £1,000.

Middlesex Gravel & Sand Co., Ltd. 19,791). Registered February 19. Coventry ouse, 5 and 6, Foventry-street, W.1. Nominal pital, £800.

Aerocrete Units (London), Ltd. (219,784). egistered February 19. 97–98, Abbey House, ctoria-street, S.W.1. To enter into agreeents with Aerocrete (Britain), Ltd., and rocrete Holdings, Ltd., and to carry on siness as company promoters, managers, and anciers, manufacturers and workers of and alers in concrete, concrete blocks and cement, . Nominal capital, £11,000.

Communications Development Co., Ltd. 20,296). Registered March 14. 8, Queenreet, E.C.4. Constructional engineers, ilders, &c. Nominal capital, £500.

Bayonne Fibre & Trading Co., Ltd. 20,186). Registered March 10. 18, Percyreet, W.1. Importers, exporters and manuturers of and dealers in fibre and peat, ick and tile, plaster and cement makers, &c. ominal capital, £2,000.

John Waite, Ltd. (220,199). Registered arch 10. Property owners and repairers, ntractors and builders, &c. Nominal capital, 00.

H. Hutchinson & Sons, Ltd. (220,664). gistered March 26. 39, Chumleigh-street, mberwell, S.E.5. Builders and contractors, . Nominal capital, £3,000.

Western Reduction Co., Ltd. (220,654). gistered March 25. Quarry owners and ners, &c. Nominal capital, £5,500.

Henry Parker & Co., Ltd. (220,738). gistered March 29. 224, Windsor House, ctoria-street, S.W. Builders and contractors, . Nominal capital, £1,050.

Medway Trust, Ltd. (220,582). Registed March 23. 44, Earl-street, Maidstone. ntractors for the execution of public works, . Nominal capital, £50,000.

H. A. Evans, Ltd. (220,573). Registered rch 23. Builders' merchants and builders' nmongers. Nominal capital, £50,000.

Ginger Lee & Co., Ltd. (220,571). Registed March 23. Plymouth-avenue, Longsight, nchester. Builders and contractors. Nominal pital, £3,000.

Levine & Co. (1927), Ltd. (220,669). gistered March 26. 62, Plumbers-row, E.1. pfitters, builders and contractors, &c. minal capital, £500.

PATENTS

APPLICATIONS PUBLISHED.*

260,435.—G. M. Steele and J. Jones & Sons, Ltd.: Walls and partitions.

260,447.—C. Pontoppidan and S. Buntzen: Production of cement mixed with gypsum.

260,461.—J. Narie: Pointing walls.

260,481.—R. Grierson and Grierson, Ltd.: Electrical heating.

260,495.—P. Allaire: Reinforced concrete elements.

260,496.—L. H. Cross: Corrugated roofing and analogous sheets.

260,507.—P. A. Astley and W. D. Brook: Walls and roofs.

256,580.—E. I. Lindman: Highly porous clay material.

260,665.—J. R. Churchill: Extensible settee.

260,680.—C. H. Beadle (deceased): Repairing bituminous road surfaces.

260,684.—Sir E. P. C. Girouard: Calcareous raw materials.

260,689.—G. Roger: Floors.

260,694.—R. B. Reith: Walls and roofs.

260,706.—H. G. Townsend and H. E. Searle: Ventilators.

260,753.—R. G. Marsh: Hot-water supply system.

260,792.—L. Pantoni and J. France: Concrete brick.

260,797.—T. C. Fawcett, Ltd., and D. L. Fawcett: Brickmaking machines.

260,800.—J. Southall: Domestic grates.

260,832.—A. Cavanagh: Drains.

260,833.—G. E. Heyl and O. Kunze: Plastering walls.

249,840.—G. Leicknam: Filling of cracks by cement or the like under pressure.

260,874.—J. B. Atkinson, J. W. Smith, and A. Mitchell: Windows.

260,875.—G. Steinmetz: Shelves.

260,877.—H. E. Leash: Machine for improving defective lumber.

260,889.—W. D. McLaren, G. M. Welsh, and J. G. Johnstone: Moulding boxes.

260,906.—J. Duffy: Paving blocks.

261,453.—W. H. Graveman: Method of making articles for building.

261,478.—J. H. Gath: Paving-blocks.

243,015.—Lambert Freres et Cie: Plaster.

261,548.—E. Swingler: Walls.

261,571.—D. Hall, J. H. Kay, and Hall & Kay, Ltd.: Metal casings.

261,589.—E. Lavadoux: Varnish.

260,538.—O. Kunze: Applying patterns to walls.

261,618.—S. Macomber: Fire-proof floor.

261,662.—J. Brown: Fireplaces.

261,679.—C. Becker and R. Eyben: Pipe-unions.

261,811.—J. Sagar & Co., Ltd., H. G. Sagar and T. R. Groom: Woodworking machines.

261,814.—T. Rigby: Cement.

261,846.—J. H. Bennetts, D. Palmer-Jones, D. H. Jones and Scaffolding (Great Britain), Ltd.: Casting or moulding cementitious materials.

261,865.—E. C. F. Oakley: Locks.

261,873.—Sir K. I. Crossley: Gateways.

261,889.—D. D. Williams and H. Williams, Ltd.: Gates.

261,895.—F. W. L. Robinson: Brickmaking machine.

261,910.—Ransomes & Rapier, Ltd., and P. D. Ionides: Concrete-mixing apparatus.

261,930.—D. Farrell and A. W. Helmholtz: Blasting.

261,940.—D. J. Sullivan: Paint sprayer.

261,943.—F. Rauwald: Building structures.

261,944.—T. Robinson & Son, Ltd., and C. J. Robinson: Wood-planing machines.

261,952.—J. Pickerill: Concrete blocks.

261,964.—J. H. McClatchy: Building slabs.

256,174.—Ternstedt Manufacturing Co.: Reversible lock control.

261,973.—J. J. Petken and A. Gotts: Paving blocks.

* All these applications are now in the stages in which opposition to the grant of patents upon them may be made.

TRADE NEWS

Boilers for Cinemas.

Messrs. Davey, Paxman & Co., Ltd., of Aldwych House, London, W.C.2, engineers and boilermakers, have recently installed a number of boilers in cinemas, amongst them being the Plaza and Carlton Theatres. The type of boiler selected in each case was the "Economic" boiler, many hundreds of which are installed in the most important buildings in London for heating by steam and hot water.

The Walworth Log.

We have lately received the April number of this little journal, published by the Walworth Company, of Boston and New York, U.S.A. This firm are the makers of the "Walworth" valves and fittings, which are being used in the Canadian International Paper Company's Gatineau Mill at Quebec. The "Log" will be posted regularly to all interested, upon application to the Walworth Company, at Boston, Mass., U.S.A.

Messrs. Pollard's Annual General Meeting.

The profits of the combined companies of E. Pollard & Co., Ltd., and E. Pollard (Sundries), Ltd., for 1926 were £37,718, after providing for depreciation, etc., and all management expenses, plus £34,366 brought forward—total £72,084. The dividend on the Preference shares has been paid, also 10 per cent. on the Ordinary shares of E. Pollard & Co., Ltd., and 7 per cent. on the Ordinary shares of E. Pollard (Sundries), Ltd., leaving £41,052 to carry forward after reserving for income tax. The retiring Directors, Messrs. H. E. Pollard, A. C. Caldicott, E. B. Richardson and J. G. Edwards, were re-elected.

"Floodgate" Lift Pumps.

The "Floodgate" Lift Pumps are mounted on a strong 4-wheeled trolley, together with a 1¾-h.p. engine of British manufacture. The pump is constructed of cast-iron and its working is not affected by sand, gravel, sludge or semi-liquids; a belt drive is employed so that the engine may be used for other purposes without any mechanical alteration, and has the further advantage of keeping the engine well away from the splashing of the pump. These outfits can also be arranged for lift and force if desired, and they are made with various capacities ranging from 1,500 to 3,000 gallons per hour. The Phœnix Engineering Co., Ltd., of Chard, are also manufacturers of a large range of municipal plant, which include bitumen spraying machines, grouters and heaters, tar and bitumen spravers and boilers, tar and bitumen mixing machines, etc.

"Arts and Crafts Society of Players."

That firms should foster a love of music and drama and the other arts among their staff is all to the good, and is fully believed in by the west-country firm of Bath Artcraft, Ltd., of Bath, Somerset, whose "Arts and Crafts Society of Players" recently produced three short plays—John Galsworthy's "The Little Man"; Miles Malleson's Phantasy, "Paddly Pools"; and Yaffle's "Foiling the Reds." "All three," says a local paper, "were well put on and played with skill, ability, humour and personality. The acting turned readily from the subtleties of Galsworthy to the "other worldliness" of "Paddly Pools," giving it just that gossamer touch that it required and to the "Red" skit, with all its broad humour. Here the three workmen were great. The Players thus showed their versatility. Some displayed outstanding talent, all attained a high standard, and the whole entertainment led one to hope sincerely that there will be more next winter."

We are given to understand that with reference to the Bath Artcraft, Ltd.'s advertisement in our issue of April 22, their work of decoration for the new premises for Messrs. Reece's, Liverpool, is being carried out under the instructions of Messrs. Geo. Williams & Son, Fraser Works, 27, Islington, Liverpool.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXII.—No. 4398. MAY 20, 1927.

THE BLOOMSBURY SITE

THE decision of the Senate of the University of London to purchase the vacant site north of the British Museum will meet with general approval. There is gratification in the thought that the controversy ch has been raging for some years is at last ended, and this ught is seconded by the pious hope that the new University re will be developed on lines worthy of the capital city of Empire.

ondon was renowned for the enterprise of its citizens at a e when Oxford and Cambridge were villages, but it was until the nineteenth century that the idea of a University the Metropolis received serious consideration. Since the r 1827, when the foundation stone of University College laid, the activities of London University have increased in a arkable way. The University at present is scattered. The tral offices are at Kensington, the nucleus of the University n Bloomsbury, there are such institutions as King's College, t London College, Bedford College, the Birkbeck, the lical schools attached to the great hospitals, the School of nomics, and many other minor departments. At a cost of half illion sterling the Senate have now purchased eleven and a acres to the north of the British Museum to form the new re. This opportunity, which is epoch making, is due to the ificence of the Rockefeller foundation, which was established rteen years ago by J. D. Rockefeller, with an endowment of undred million dollars.

ondon has educational facilities suited to that section he community desiring to specialise in the higher branches culture. It is now recognised throughout the world for nce, art and research. Like Paris, London will in time e its Sorbonne, and the proposed development of Blooms- y will correlate the varied activities which are at present tered. Viewing the issue dispassionately it can be said t acquisition of the site is more than justified. The British seum, in itself a University accessible to all, forms the head, versity College, already four times the size it was a century forms the northern boundary. The amenities of Blooms- y, which in the 18th and early 19th centuries were mainly dential, have not altered materially. There is still an air paciousness and grace, the squares and wide streets with uniform houses being among the best in the Metropolis. he position is served by three trunk railways, by tubes and nibuses. There are well equipped sports grounds in the urbs, and there is the possibility of acquiring the Georgian ses in some of the northern squares and converting them he purposes of hostels and homes for professors.

here now remains the delicate question of a development n, which will correlate the proposed new buildings and bring n into harmony with those existing. No piecemeal nibbling meet the present exigencies. Nothing but a definite plan wing for expansion, and providing for every contingency, uld be sanctioned. The buildings required for the centralisa- scheme are as follows:—There are the administrative dings, the Senate House, the central library, ceremonial and examination buildings. The Department of Historical earch, at present temporarily housed, requires new premises. ddition there must be a students' union and headquarters he Officers' Training Corps, as well as a Hall of Faculties. ill be understood that all these buildings cannot be started he near future. On the contrary, the development or k plan must be schemed in advance, and this demands ginative handling, as well as full and inner knowledge of the cking of universities. Once this plan has been schemed sanctioned, future buildings could be undertaken, each severally, as funds permitted. If the plan is on logical lines ndividual buildings could be adjusted as occasion demanded.

So far as the geographical situation of the site goes the opportunity is unique; the site is level, and the conventional scenery to be evolved will have to make its own dominant points; but there is no reason to doubt that a good result will be attained. The issue, on every count, is one of the utmost importance, and not the least is the question of the architecture. In the course of the next century the University of London will become the educational centre of the Empire, its ideals being the fulfilment of the common traditions of learning and the extension of the great aspirations of culture. The older universities will continue and make their own appeal, and that independence which is the aim of each provincial university will attract local students in different parts of the country. London University, however, by reason of its facilities, as well as by the growing numbers of metropolitan students, its advanced policy and widespread aims, is bound to become more and more democratic. In other words, it will be the meeting point for students from all parts of the Empire.

To interpret all these visions and realities is the function of architecture, and this raises the question of the choice of an architect. Never at any time in the history of the nation, with the exception of the period after the Great Fire, has such an opportunity occurred for the display of real genius. The art of architecture has advanced from its era of groping and uncertainty, although in some of its manifestations it lags far behind scientific achievement. Opinion to-day no longer inclines either to Classic or Gothic. The choice of a style, or copying and transposing from old models, has now given place to considerations of fine building. The younger generation, trained in the schools, has been led to think in terms of plan, the right handling of material and the adjustment of the more scientific branches of building. There is in consequence a new leaven at work, which in time will eradicate all the evils which at present represent unbridled license. The new University centre is not a subject for wild essays or ridiculous gropings after mere effect, neither is it an opportunity for pictorial display or for individual aggrandisement. In the age of Wren there would have been no doubt of the result; in Sweden an Ostberg could be relied upon to evolve a group of buildings which would be of significant character. In France, a Nenot and in America a McKim or a Goodhue. There are those who doubt the merits of an architectural competition, just as some view with alarm the nomination of an architect. The question of the control of the site as a building project is one demanding an expression of opinion not only from the Senate of the University, and architects as a body, but from the whole of the public. The real issue is bound up with town planning and architecture, and this fact is rendered more patent by the many lamentable mistakes made in the past. To-day something is needed to stimulate English civic design, and at the same time to show the world that this country has a soul above the mundane The old rulings which produced the colleges of Oxford and Cambridge were directed by the autonomous influence of the Church. It is obvious that such considerations do not apply to-day. In an age when science is in the ascendant it would be ridiculous to express modern University buildings in the externals of old Rome, or to furnish elevations in the fustian of columns, pediments and applications of new old styles. As the case is of national importance and one demanding clear thinking and Napoleonic reasoning, we believe that a preliminary building committee should be appointed by the Senate to discuss the architectural and town planning aspects of the problem. Such a body should be advisory, and should consist of those who are disinterested and who would consider the whole question apart from any personal considerations.

NOTES

A Cottage Design. We note that a writer in a daily paper truthfully remarks on the importance of the roof line and the contours in cottage design. But he goes on to say that the contour should be wide and high, which seems to suggest a serious error in design. The roof outline is responsible for much of the success or failure of cottage design, and the general form and effect of a cottage or block of cottages are dependent on pleasing lines of roof. Many cottage designs have lost their quality by the reduction of the pitch of roof, by awkward dips and ungainly dormers. A high pitch roof is not necessarily an essential point in cottage design as the many low-pitched roofs of old cottages in Yorkshire testify, but the high-pitched roofs in the Cotswold district certainly have a picturesque quality which is very attractive. With regard to windows we all know that the proportion between solids to voids is of vital importance, and it is in the happy relation of openings that the capable designer scores. In the old cottages the robust and solid look is produced by the smallness of the window openings, and if one makes the windows both wide and high we at once discount much of the charm of the old work. The failure of many modern cottages in contrast with the old, lies in the unhappy disposition and the size and proportion of windows.

Restoration of Rheims Cathedral. It is no doubt not necessarily assumed that in replacing the sculptures on Rheims Cathedral, destroyed by the bombardment, we can retain the feeling and character of the lost originals. And yet how often this is assumed to be the case? Is it desirable that imitations should take the place of the destroyed sculptures, or do they offer us any compensation for the loss? May they not, on the contrary, make the loss yet greater? It appears to us that the better way, if the sculptures are to be replaced, is to take the adventure of art and for good sculptors to be employed to do the work, leaving them the freedom of their own interpretation. The only other alternative would appear to be that of accepting the loss. If different periods of architecture may be seen to combine, is it not possible that modern sculptors can work in enough sympathy with the conditions to make their work combine as well? In any c the fact remains there is no alternati for the mere attempted reproduction the destroyed work is no contribution its restoration, rather an addition to loss. It will be better in all ways wi we have the courage of our own w restored to us, and freedom is given the interpretation and living force of own vision to come into play, instead this everlasting resuscitation of peris forms. Mediævalism is dead, but spirit allied to all time is with us n when we have conviction enough liberate it.

Vandalism in the Rosthwaite Valley. We confess to a desire further depredations on road fund by the Chance of the Exchequer when see the damage resulting the really disastrous mutilation of road from Keswick to Rosthwaite beyond. There is really no reason, we learn from some motorists themsel why they should not slow down w passing, and would not this have b better than the rude dismemberment this once enchanting roadway? It se we have lost our sense of proportio these matters. After all, if asked, should all prefer a beautiful road preserved, even at the loss of a little when motoring, and the winding grac this road was worth more considera than such facilities. The very obj which bring people to this neighb hood, its lovely surroundings and a ciations, are thus sacrificed for the m of reaching them, which does seem surd. The familiar landmarks of r tree, fern, bank, and winding road dear to the pedestrian as he passed al are now suffering a change, which him, the truest user of the road, will m a loss quite irreparable.

East Kent. Professor Abercrom in addressing the R.I.B. on development in E Kent, mentioned a where outrageous design has been inflic

recent years by a local authority ich erected "unworthy and de-ssing" houses in close proximity to own which is famous as an example of diæval beauty. He pointed out, by y of contrast, that when the same town duced an historic pageant, it sought ert advice as to incident and costume, its housing scheme was not thought th a qualified architect. The pageant faded—the houses remain. Such es are common, and it is good to e, in the R.I.B.A. Annual Report, t letters of protest have been addressed local authorities guilty of this short-ntedness. It would be of great assist-e if influential citizens could be per-ded, in such cases of vandalism, to the matter fairly and squarely before public in the local Press.

The Poster. The President of the British Poster Advertising Association remarks in a letter to the Press that "ugliness er brought honourable trade," and gests that the simple recognition of truth alone would be enough to commerce to seek out artistry and nly suggestiveness on the hoardings. President is further of the opinion "too often when posters are con-ned it is really enamel signs that are fault." With this we agree. The ant enamel sign is one of the worst ng futilities, and its durability is one s great disadvantages. Even after ostensibly useful purpose is over it inues to deface the railway station he fence where it was put up. One t hope that advertisers will not con-their efforts to the great work they are doing in improving the poster, but will also devote a little energy to removing ancient enamelled landmarks.

Mr. David Evans, Sculptor.

Venice and London. The charm of atmosphere in London is an endless pleasure and wherever we travel we come back to our streets and parks and squares with ever-increasing pleasure in the wonderful effects of light and shade which seem to be a special heritage of London. In a clever series of drawings at the Walker Galleries in Bond Street, Miss Keir gives us parallel scenes from Venice and London which show that to the eye of the artist one may find as pleasing effects of soft and mysterious lights and shades in our overgrown metropolis as can be found on the shores of the Adriatic.

The Lighthouse. The idea of incorporating anything so utilitarian as a lighthouse in a sketch model of a War Memorial is a departure from the practice of the last few years when many memorials have been purposely given forms as remote as possible from public service of any other than a spiritual nature, but the sketch model exhibited in the Lecture Room of the Royal Academy by Henry Poole, A.R.A., and J. F. Wilson, R.B.A., is none the less interesting on this account. A hundred years ago the memorials of Waterloo took the shape of substantial contributions to the practical well-being of the community, and it has still to be shown that they were one whit the less effective as memorials on that account, or that they failed to inspire that best form of patriotism which helps forward communication and establishes civilisation upon a wider basis. The little lamp in the darkened shrine may appeal to many minds, but the great lamp of the lighthouse has the same spiritual value which is not lessened but increased by its practical function.

Welcome Bequests. It is pleasant to note that the profession benefits by the action of the late Mr. Delissa Joseph, whose will has just been made public. Half of his residuary estate goes to the R.I.B.A. to found a scholarship for study in America, and the testator has also left £200 a year to one of his assistants and £100 a year to another.

Tree Culture. In view of the interest evinced in our article on "Treeless Tracks" in our issue for April 29, we are glad to call attention to "the Men of the Trees," a society founded to encourage the planting and care of trees to educate public opinion on forestry and generally to foster the love of trees in every section of the community. The hon. secretary is the Hon. Mrs. Grant Duff, 16, Mulberry Walk, Chelsea.

Royal Academy Exhibition, 1927.
Torso. Marble.
Mr. David Evans, Sculptor.

GENERAL NEWS

Professional Announcement.

Sir John W. Simpson and Mr. Maxwell Ayrton having dissolved partnership, Mr. Maxwell Ayrton has moved his office to 7, Grosvenor Street, New Bond Street, W.1. Tel. Mayfair 1470.

Oxfordshire Town-Planning Conference.

The Oxfordshire County Council has decided to convene a conference of district councils to consider the desirability of joining a regional town-planning scheme to include the whole of the county.

Rheims Cathedral.

The nave of Rheims Cathedral, which has now been sufficiently restored to be used for public worship, was on Wednesday of last week formally handed over by the civil authorities to Cardinal Luçon, the Archbishop.

An Album of Sketches.

An album containing sketches and water-colours by about 100 artists was sold by auction at the 112th anniversary dinner of the Artists' General Benevolent Institution at the New Princes Galleries last week. The bidding started at 50 guineas, and the album was knocked down to Mr. Maurice Webb for 150 guineas.

A Nature Reserve in Staffordshire.

Hawksmoor Nature Reserve, near Cheadle, will be dedicated for the benefit of the public to-morrow, May 7. The estate, which consists of 267 acres and is about 600 ft. above sea-level, has been acquired for the nation by the National Trust, and Lord Grey of Fallodon, vice-president of the trust, will take part in the opening ceremony. In addition to its natural beauties the estate is a favourite resort of birds, including some rare species, and one of the objects of the National Trust in acquiring the reserve has been to make it a sanctuary and a place for the preservation of animal life.

Newport's Civic Centre.

Newport (Mon.) Corporation has decided to acquire a site on which to build a new town hall and law courts. The cost will be about £500,000.

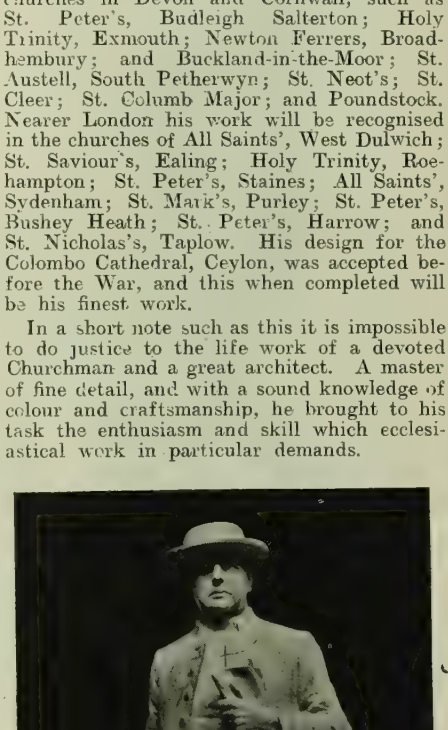
Advertisement Hoardings at Oxford.

The Oxford Bill Posting Company has issued a writ against the Mayor, Aldermen, and citizens of Oxford. They claim that under the Act of 1847 the Corporation has no power to enforce the removal of certain poster hoardings in the city, and ask for an injunction to restrain the Corporation from removing such hoardings or otherwise proceeding to enforce the notice.

London University and Bloomsbury.

We understand that the University of London has at last acquired the Bloomsbury site for extension. The University site is that which was bought by H.M. Government in 1919 from the Duke of Bedford for University purposes, but was reconveyed to the duke after the University had found it impossible to accept the conditions attached to the Government's offer of the site. It covers an area of approximately 11 acres, including roads, or 8½ acres excluding roads and the garden of Torrington Square, and lies immediately north of the British Museum, being bounded on the south by Montague Place, on the west by Malet Street, on the north by Gordon Square, and on the east by Woburn Square, Upper Montague Street, and Russell Square. Part of the site is now occupied by temporary buildings serving purposes connected with the University, including the Institute of Historical Research, the School of Slavonic Studies, the Students' Union, and the Architectural Atelier.

OBITUARY



The Late G. H. Fellowes Prynne, F.R.I.B.A.

Mr. G. H. Fellowes Prynne's death on the 7th inst. will create a loss in the profession of Architecture, which cannot easily be filled. He was President of the Architectural Association in 1899 and 1900, and took an active part at all times in the affairs of the A.A.

Amongst his official appointments were those of Oxford Diocesan Architect, and a member of committee of Honorary Consulting Architects to the Church Building Society. The second son of the Rev. C. Rundle Prynne, he was born at Plymouth in 1853, and was educated at Chard College and Haileybury. He was a pupil of R. C. Windyer, of Toronto, Canada; and later entered the office of Geo. Edmund Street, R.A., as a pupil. He entered the R.A. Schools as a student in 1876.

Although he carried out some domestic work, notably Hadlow Grange and Gifford House, Roehampton, ecclesiastical work occupied the greater part of his time. In the West of England there are many delightful examples of his art. The earliest of his works in the West is St. Peter's, Plymouth. He built or restored many well-known churches in Devon and Cornwall, such as St. Peter's, Budleigh Salterton; Holy Trinity, Exmouth; Newton Ferrers, Broadhembury; and Buckland-in-the-Moor; St. Austell, South Petherwyn; St. Neot's; St. Cleer; St. Columb Major; and Poundstock. Nearer London his work will be recognised in the churches of All Saints', West Dulwich; St. Saviour's, Ealing; Holy Trinity, Roehampton; St. Peter's, Staines; All Saints', Sydenham; St. Mark's, Purley; St. Peter's, Bushey Heath; St. Peter's, Harrow; and St. Nicholas's, Taplow. His design for the Colombo Cathedral, Ceylon, was accepted before the War, and this when completed will be his finest work.

In a short note such as this it is impossible to do justice to the life work of a devoted Churchman and a great architect. A master of fine detail, and with a sound knowledge of colour and craftsmanship, he brought to his task the enthusiasm and skill which ecclesiastical work in particular demands.

Royal Academy Exhibition, 1927.

The late Archdeacon Buckley. Bronze.
Sir W. Goscombe John, R.A., Sculptor.

COMPETITION NEWS

Wiltshire Working Men's Conservative Benefit Society. Proposed New Offices, Trowbridge, Wiltshire.

The assessors in this competition, Messrs. Cyril A. Farey and Robert Lowry, A.R.I.B.A., F.R.I.B.A., have made their award as follows:—

1st: Messrs. F. J. Lander, A.R.I.B.A., E. A. D. Tanner, A.R.I.B.A., c/o Mr. L. de Soissons, F.R.I.B.A., S.A.D.G., city architect, Estate Office, Welwyn Garden C Herts.

2nd: Messrs. C. F. Bates, A.R.I.B.A., C. L. Jones, L.R.I.B.A., Capital Counties Chambers, 30, Commercial-str Newport, Mon.

3rd: Mr. A. B. Llewelyn Roberts, Messrs. Collcutt and Hamp, 126, Wigm street, London, W.1.

Highly Commended: (No. 2) Mes Harry L. Black and Thomas Stott, 3, N ton-road, Bayswater, London, W.2; (No. Messrs. Cruickshank and Seward, A.R.I.B Crown Buildings, 18, Booth-street, M chester; (No. 31) Mr. D. F. Martin-Sm A.R.I.B.A., Miss E. Moseley, A.R.I.B.A., Mr. A. S. Knott, A.R.I.B.A., 45, Bloomsb square, London, W.C.1; and (No. 74) C. H. James, F.R.I.B.A., of Messrs. Ja and Bywaters, 15, Gower-street, Bedf square, London, W.C.1.

The whole of the designs submitted h been on exhibition during the past week Holy Trinity Church Hall, Newtown, T bridge, between the hours of 10.30 a.m. 12.30 p.m. and 2 p.m. and 4 p.m. exhibition closes to-morrow. Eighty designs were submitted. Premiums total £250 are to be awarded.

Strode Park Estate: House Design Competition.

We have received the following no from the R.I.B.A.:—

"Members of the Royal Institute British Architects must not take part in above competition because the conditions not in accordance with the published re lations of the Royal Institute for Ar tectural Competitions."

Council School, West Bromwich.

West Bromwich Education Comm have decided to promote an open com tion for designs for a proposed new Cou school on the Charlemont Estate.

M

RECENT DEVELOPMENTS IN HOSPITAL PLANNING ABROAD.

Mr. Lionel G. Pearson, F.R.I.B.A., read a paper on this subject at last Monday evening's meeting of the R.I.B.A., when the President, Mr. E. Guy Dawber, A.R.A., occupied the chair. The lecturer, in opening his address, said that his original intention was that his paper should follow on after a lecture by his partner, Mr. Adams, on English Hospitals. Personally, he was sorry that Mr. Adams had decided to give a separate paper on the subject of British Hospitals, as it would have been extremely interesting to make a comparison between the work done in this country and abroad. However, in view of the very wide field to be covered, he was sure his partner's decision was a wise one, and they would look forward to an exhaustive paper on this subject at some future date.

He was confident (the speaker continued) that no country in the world had finer hospitals than England, but he thought everyone would agree that there was much to be learned by seeing what other countries were doing in that line. It would be found that the European hospitals were more on the lines we adopted in this country—that was to say, the horizontal type of planning was the favourite, and a modified type of the pavilion system still held its own; but on the other side of the Atlantic there was a strong tendency to adopt the vertical type of planning, and the pavilion system was coming to be regarded as old fashioned, though there were still many examples of the latter (such as the Peter Bent Brigham Hospital at Boston, and the John Hopkins Hospital at Baltimore). There were some critics who would say that in Europe the comfort of the patient was the first consideration, while in America the efficiency of the staff was put before everything else, but the two points of view would seem to be of almost equal importance to the hospital planner. The science of hospital planning was pursued very successfully in all the countries he visited, and there was a friendly rivalry to produce buildings which were up to date from the point of view of medical science and at the same time attractive to the patient. Apart from the general features, such as the planning of the wards, the arrangement of the operating blocks, etc., he was specially interested in the planning of (1) the private patients' rooms, and (2) the X-Ray departments, as both these were important recent developments in hospital planning. He was cheered to find in his journeys that some of the difficulties that beset hospital architects in this country were apparently universal; for instance, he never met a sister who was really satisfied with the accommodation provided for linen, or found a type of window which admitted fresh air without causing a complaint from some patient in the ward.

Having described some Dutch hospitals, the speaker said the characteristics which might be said to be typically Dutch were cheerfulness, cleanliness, and common sense, with solidity of construction, and fresh air and light everywhere. The colour schemes were usually very cheerful, as, for instance, corridors in one case were painted bright yellow and doors bright red. Altogether, Holland might be said to have very much our ideals in hospital design.

Having described a number of Danish hospitals, the lecturer summed up by saying that the tendency in Denmark was to prefer large hospitals built in the pavilion system, the buildings generally being of ample dimensions, well built, and well fitted internally. The objection to this system was undoubtedly the length of the corridors and the amount of energy expended by the staff in conveying themselves and the food and stores over these considerable distances. In addition to this, the monotonous repetition of blocks was very depressing architecturally, and the size of the institution must rather eliminate the human element. However, there were, no doubt, very great advantages to be gained in other ways, as the Danes were an extremely practical people, and their hospitals had a very high reputation.

After describing a recent Swedish hospital, the speaker said there had been a distinct attempt made in recent hospital design in Sweden to make the buildings architecturally attractive, and this was to be expected in a nation which was so artistically alive. The small wards, and to some extent individual sanitation, were approaching the up-to-date American model, but there was a lack of finish in the detail and the constructional methods, which fell much behind the best American work. Perhaps in the cold northern climate there was not the same necessity for precautions as to ventilation, rounded angles and all the detail we considered of such importance.

Coming to a consideration of American hospitals, the lecturer pointed out that the industrial expansion of recent years had led to a great building activity, especially in the big cities, and the number of hospitals alone which had been built during the last ten years was amazing, and it would be almost impossible to visit them all personally unless anyone was prepared to spend many months about it. Fortunately, the leading architects were mostly located in New York and Chicago, and as they were most generous in imparting information and showing plans the task was much simplified. The co-ordination of specialists was one of the successful features of American practice, and the result was that before the building was begun the plans were settled in great detail, and the result was speed and efficiency in the erection. Conferences were frequently held, too, during the progress of the works, and in some architects' offices there was a special conference room where meetings took place regularly between the client, builder, specialists, etc.

As the great majority of the people of the Eastern States lived in cities, the city hospital was the most usual type, and the multi-storied hospital was the most popular just now, following the line of the office building, hotel or apartment house. This had led to the vertical type of planning, with the elevator, the laundry chute and various other labour-saving devices playing a leading part in the construction. The long corridors of the European hospital were considered quite out of date, and one American visitor remarked after seeing one of our hospitals that he hoped the staff were fitted with roller skates. The concentration which resulted from the vertical plan certainly simplified the problem of the heating, lighting, plumbing and other services. There was also the element of what must be called advertisement, for want of a better word, as the high building was never out of sight and out of mind, which was an important point in a voluntary hospital.

Before describing a number of hospitals in detail, the speaker summarised briefly what he thought were the most noticeable features of a typical American hospital.

The entrance was made as attracti possible, and the waiting room was furr like a hotel lounge, and frequently rep on a smaller scale on the ward floors.

The enquiry office was usually facin entrance, and was sometimes in the hall as central heating allowed halls and cor to be used in this way.

The record room was also near at and the methods of filing and keeping re were justifiably a source of great pri the superintendents and stenographers.

The staircase was not a very impc feature as a rule, but the elevator-lobby up for this.

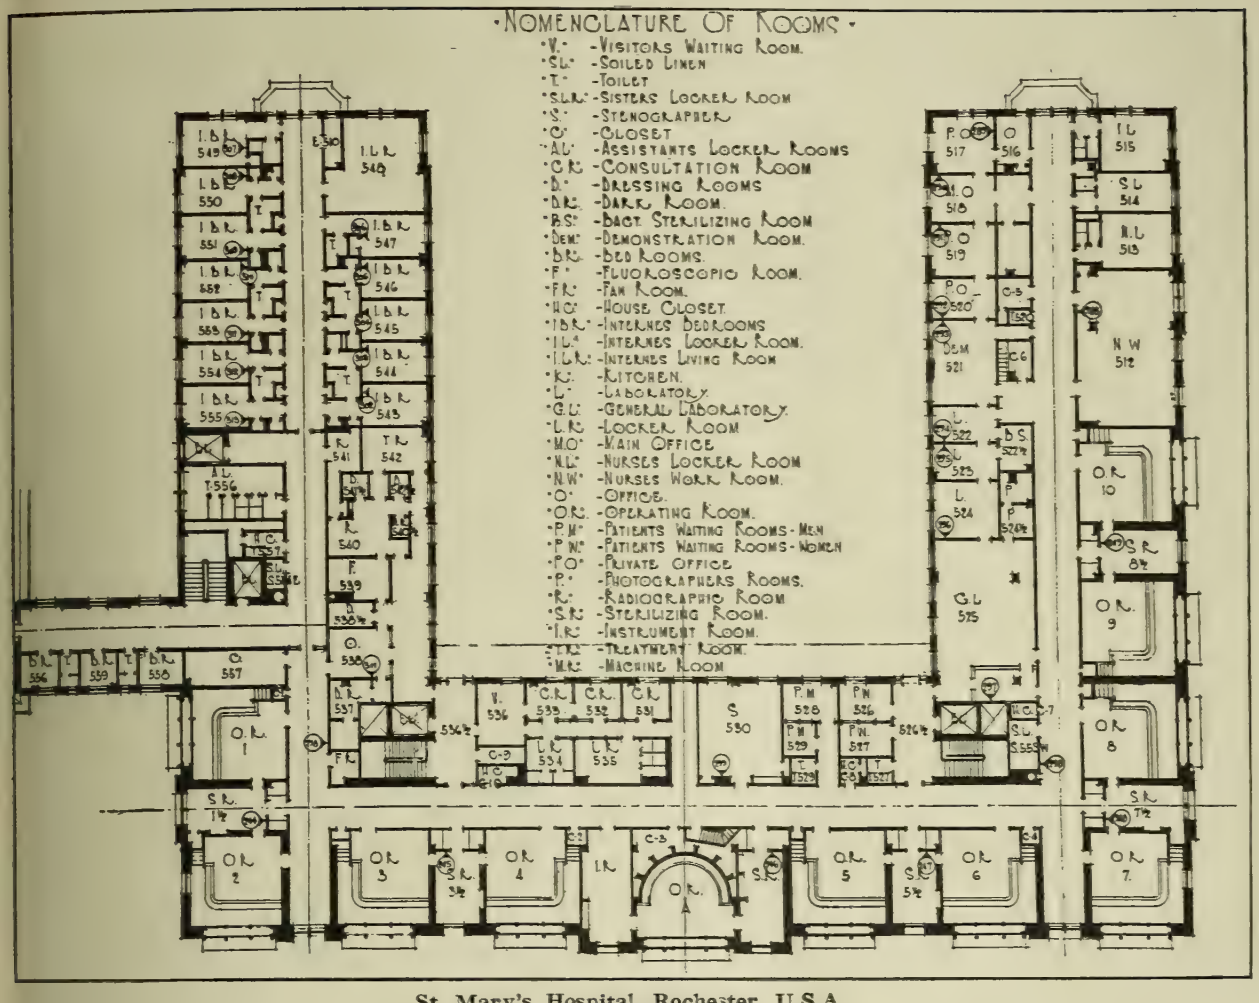
The kitchen, most frequently placed basement and mechanically ventilated, equipped with every sort of device, ele ally-heated food conveyors, electric washing machines, mixing machines, or squeezers, etc.

A cafeteria for the staff was now usual, and even the nursing staff were tr to this form of self-service.

The wards were now in much smaller than formerly—16 beds being the maxi and these were frequently divided by g screens into bays of four beds.

The single-bed ward was becomin creasingly the fashion, though an exper calculated that only 30 per cent. o patients in an ordinary hospital reall quired them.

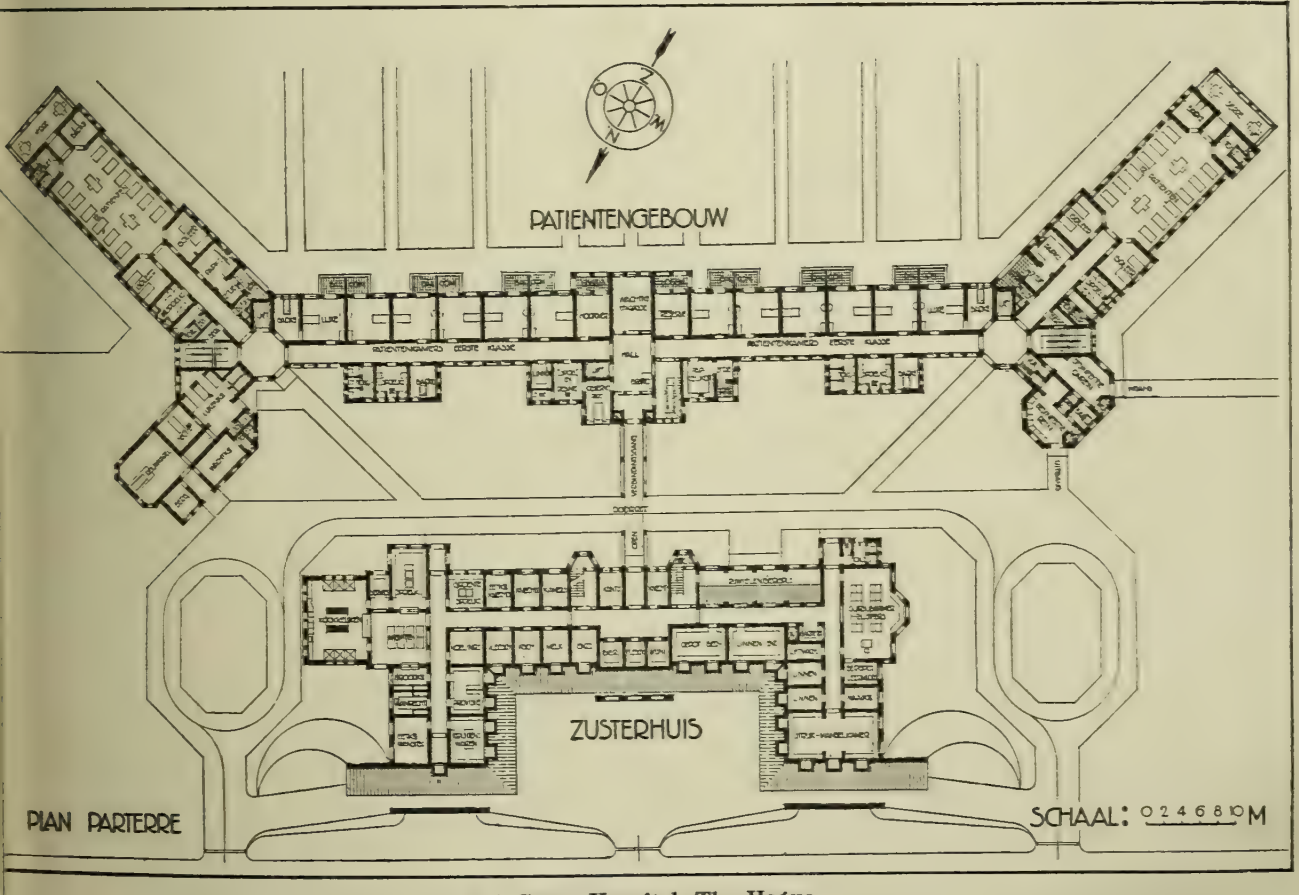
The nurses' station was either in a g enclosure overlooking the ward, or else to the corridor commanding the approa the ward.



The diet kitchen was centrally placed it might be noted that the use of refrige was general, and "the larder facing nc not required. Opening off the corridor linen stores, pails and brooms, etc., ar the usual accessories, including the ver portant flower-room, with a sink and sh

The solarium was either at the end ward or a loggia provided on each flo the use of patients, leaving the ward cl balconies, and at the top of the build comfortably furnished sun room was pro with French windows opening on t "deck" over wards below.

The operating block had an ope theatre with floor and walls of pale g pale green tiles, or similar material (h only one instance of rubber), and the light was decidedly out of fashion. reason for this was that the present-da geon preferred artificial light, and i instance 100 cases between 7 a.m. and 7 in the month of October, showed 69 ar and 31 natural. The anæsthetic room u opened off the corridor, and was freq furnished like an ordinary room to avo "operation atmosphere."



The plumbing of American hospitals v rather different lines from what we cons correct in this country. The sink (known as the utility room) opened o corridor without a cross-ventilated while baths and w.c.'s (known as toilet) opened out of the patients' rooms, and frequently without windows, dependir mechanical ventilation. The pipes almost always buried in the wall or c which added greatly to the smartnes cleanliness of the sanitary rooms. Al showed great confidence in modern me of plumbing, though one suspected that time there might be trouble ahead.

The increasing importance of X-ray was nowhere more fully recognised th America, where the use of X-ray for nosis had reached such a point that i important hospital more than 85 per of the patients were now X-rayed. T sult was that there were now many planned and splendidly equipped departments, and one of the best of was to be found at the Roosevelt Ho New York City, where the architects, and Sawyer, worked out a plan in co tion with Dr. Steiner. The departmen situated on the ground floor, near the c ing block, and conveniently placed fc out-patients, and consisted of a radiog

Red Cross Hospital, The Hague:

MR. CUYPERS, Architect.

room, dark-room with special light-excluding pass-boxes of a revolving type, cystoscopic room, fluoroscopic room, viewing room, with an excellent set of viewing-boxes made of enamelled steel, and filled with Cooper-Hewitt lights, and a room for files. The treatment rooms were in a corner of the building, cut off by corridors from the rest of the department, and special precautions were taken against rays, as the whole of the walls and ceilings were treble-lined with lead, wire-mesh, and finally glazed tiles, and the floor was lined with lead and cork.

There was another very fine X-ray department at the Boston City Hospital, in the New Thorndike Memorial Building (architects: MacGinnis and Walsh). This department was on two floors—on the ground floor, waiting rooms, radiographic rooms, viewing room, and records; in the basement were the treatment rooms (with machines enclosed in a room six feet wide, between two treatment rooms in every case), an exceptionally fine dark-room, with smaller rooms for wet plates, plate-loading, etc. Special attention had been paid to the ventilation—an important point, unfortunately too often overlooked with resultant damage to the health of the assistants. There was a lecture-hall at the end of the corridor, two floors in height, for the use of the department; so that altogether this was in many ways a model of what an X-ray department should be. The colour of the walls found to be most satisfactory by the X-ray men was orange or buff, and several departments had plastered walls coloured to these tints, and the floors were usually tiled like an operating theatre, or covered with battleship linoleum with a border and skirting of terrazzo.

The following points of construction were summarised from the detailed description of the hospitals visited :—

Doors.—The flush hospital door veneered with mahogany was usual for all patients' rooms, and the fanlight was usually solid to match the door.

Windows.—The sash window was almost universal, with or without the fanlight over, and with or without bars according to the design of the architect. A small opening about 7 in. by 2 in. was frequent in the bottom rail of the sash. Jalousie shutters or sunblinds were necessary in the summer.

Floors.—Hardwood floors were used in offices, etc., sometimes, but rarely in patients' rooms. The most usual floor was "battleship" linoleum laid on concrete with a margin and base of terrazzo, rubber tiles for corridors, unglazed tiles or terrazzo for operating theatres. The terrazzo was divided into squares about 4 ft. or 5 ft. by metal strips. Rubber floors and dados were occasionally used in operating theatres.

Ceilings.—Sound-proofing materials were frequently used for ceilings in sheets.

Fittings were increasingly made of metal. Cabinets, linen cupboards, door frames, doors and windows, glazed divisions to form cubicles, beds, and ward furniture.

Signal system had become almost universal. The patient called the nurse by pushing a button which turned on a light over the door and on the annunciator at the nurses' station and superintendent's office.

It was difficult to arrive at any very definite conclusions from a survey which included countries of greatly different climate and conditions, but there were some tendencies which were marked everywhere. The large ward of 25 or 30 beds seemed to be a thing of the past, and smaller units were the rule—16 beds fairly frequent, but 12 beds usually preferred. The number of rooms allocated to private and semi-private use was the most marked feature of the present-day planning, though naturally less marked in Europe than in America. The individual sanitation which accompanied it in the latter country was perhaps rather overdone; it must mean great expense in the cost of plumbing and fixtures and entail a considerable amount of labour in the running of the hospital, but the provision of hot and cold water in private rooms and rooms for nurses and staffs was of great advantage, as the hotels were finding in all countries.

The cross-ventilated lobby was no longer insisted on to the same extent, partly owing to the confidence felt in modern plumbing and partly on the ground of cost. The central corridor, on the other hand, found in so many American hospitals, was not a feature of the plan which we should like to see followed over here, and in this respect the European hospitals would appear to have the advantage in point of cheerfulness and health. In comparing the vertical and horizontal systems of planning, there were points in favour of both, but on the question of extension (which was of primary importance to hospitals), there was little doubt the horizontal system was easier to handle. Mechanical efficiency was found most highly developed in America, but reliance in mechanical means had certain drawbacks, and the case of mechanical ventilation might be given as an instance, but the saving of labour was such an important side of modern life that we ought to welcome any attempts made in that direction. Oil-fuel installations were being adopted increasingly, as they resulted in the saving of labour caused by the handling of coke and ashes, and they also had the advantage of greater cleanliness.

Finally, the question of architectural interest and beauty was now recognised to be just as important for hospitals as it was for banks, churches, and private residences, and it was very encouraging to find that this side had been so much more considered than it used to be in the last century. There was a determined effort to make the buildings attractive both externally and internally, and each country had worked out its own salvation in this respect.

Discussion.

Mr. W. A. Pite, proposing a vote of thanks to Mr. Pearson, said that one felt staggered at the vastness of the detail in hospital design and equipment that architects had to assimilate. It was interesting to find that brother architects in other parts of the world were "up against" the same problems that we encountered in this country. Wonderful methods of centralisation and control were shown in modern planning.

Dr. Jane Walker, J.P., seconding the motion, said that America had no real monopoly of the best hospitals. The lecturer, she continued, had made no mention of round wards, which used to be the vogue, and a great deal was to be said for them from the patients' point of view. In the speaker's opinion there should be no patient opposite another and none opposite a window. No doubt there was much to be said for the single-bed ward, but she would like to see wards with one row of beds only—not two. She felt that very few working-class patients would care to be in single-bed wards for weeks or months on end. The lecturer had said nothing about children's hospitals. She felt that children in hospital ought to be kept separate from both men and women.

Sir Holburt Waring, F.R.C.S., said that American hospitals had the supreme merit of providing the plant and machinery for "working" the patients. In this country, especially in municipal institutions, that point was not sufficiently realised. Referring to the hospital at Copenhagen, which the lecturer had shown on the screen, the speaker said he had seen it, and, while it was a beautiful hospital, it was much more expensive for nursing and the staff than a hospital arranged in the traditional manner. With regard to one-bed wards, it had to be remembered that in our large voluntary hospitals students had to be trained for the medical profession, and hospitals had to be planned to conform to that need. Moreover, while in the U.S.A. the percentage of "charity" patients in voluntary hospitals was small, in this country some nine-tenths, perhaps nine-twentieths, of the patients came under this heading. In his concluding remarks, the speaker criticised the "sanitary tower," being a feature that might be very much better than it was, and said that hospitals need not necessarily be beautiful, but should serve their purpose economically.

Dr. Louisa Martindale said that the pavilion system of planning was best suited in Germany, where hospitals were planned for 2,000, 3,000, and even 4,000 patients. Referring to the planning of operating theatres in connection with post-graduate courses in America, the speaker said that if one could not follow the stages of an operation directly by looking down, it was possible to do so by means of a mirror.

Mr. C. H. James said it would be interesting to know what effect the war had had on hospital design. Operations had had to be carried out during the war in the most unsuitable places, according to modern principles of hospital hygiene, yet without any harm to the patients.

Mr. Charles Elcock emphasised the need for research with regard to hospital floors.

The President, having made a few remarks, Mr. Pearson, in reply, said he agreed that we were rather hidebound by tradition. In America he saw no children's hospitals, but babies' wards. He did not come across a single instance of a circus ward. He thought the war eventually would have some effect on hospital planning. During the war he was in a house by Mr. Ernest Newton, in the Malvern Hills, which was turned into a hospital, and it was quite delightful, though never intended for such a purpose.

At last Monday evening's meeting of the R.I.B.A. the hon. secretary announced with deep regret the death of the following members :—

George Halford Fellowes Prynne, elected Associate 1881, Fellow 1891.

[Mr. Fellows Prynne was a Past-President of the Architectural Association and represented that body on the R.I.B.A. Council from 1898 to 1901. He also served on the R.I.B.A. Council from 1900 to 1904.]

James Leonard Williams, elected Fellow 1906.

Percy Joyce Adams, elected Associate 1915.

[Mr. Adams was Ashpitel Prizeman 1915.]

John William Burrows, elected Licentiate 1910.

Lionel Littlewood, elected Licentiate.

Herbert Quinton, elected Licentiate.

R.I.B.A. Maintenance Scholarships in Architecture.

The Maintenance Scholarships Committee announce that they have received a contribution of five guineas from the Nottingham and Derby Architectural Society towards the Maintenance Scholarships Fund.

R.I.B.A. Prizes and Studentships.

THE TITE PRIZE, THE SOANE MEDALLION, AND THE VICTORY SCHOLARSHIP.

The Board of Architectural Education draw attention to the fact that since the scheme for the R.I.B.A. prizes and studentships was modified, the following entries have been received each year for the respective prizes :—

The Tite Prize.—1925-1926, 41; 1926-1927, 64; 1927-1928, 114.

The Soane Medallion.—1925-1926, 3; 1927-1928, 25.

The Victory Scholarship.—1926-1927,

R.I.B.A. Working Drawings.

An Exhibition of R.I.B.A. working drawings is on view at the School of Architecture, Liverpool, until Friday, May 27.

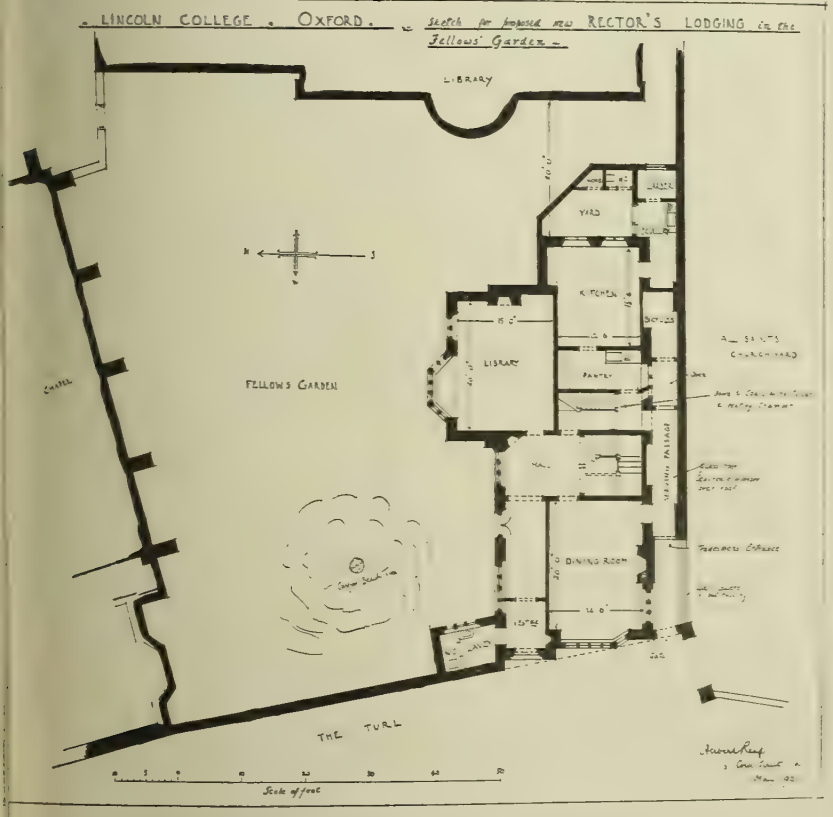
Parliament Building for the Government of Northern Ireland.



he site for this building, which is now in se of erection, is situated about three s from the centre of Belfast, and is wn as the Stormont Castle Estate, on ch is the residence of Viscount Craigavon, Prime Minister. In close proximity is the Speaker's house, recently completed n designs by Messrs. Knott & Collins. original proposal was to make the Parent House the central feature of a group hree buildings, the other two accommong the Departmental Government staffs. s project has, however, now been abaned, and the offices in question are now rporated in the Parliament building. s has entailed the preparation of an en- new design, so arranged that the idations of the original project, which e in position before the change of proame was decided upon, could be again sed. It will be seen that the central dome, which formed such a marked feature in the original conception, has, for reasons of economy, now been omitted.

The building is to contain two chambers arranged on the same general lines as at the Houses of Parliament at Westminster, the portion west of the large Central Hall containing the House of Commons, and the Senate occupying the eastern portion. The building is placed about three-quarters of a mile from the main road and is approached by a wide processional roadway on an upward gradient, the terrace at the foot of the wide flight of approach steps being about 165 ft. above the main-road level. The building itself is 365 ft. long and 164 ft. deep, the height being 70 ft. above its surrounding pavement, and will be faced with Portland stone on a plinth of Irish (Slieve Donnard) grey granite.

The architect is Mr. Arnold Thornely, F.R.I.B.A., of Liverpool.

Lincoln College, Oxford.

Lincoln College owns the freehold of the land on the west side of the Turl from Market-street to the High-street, and it is proposed that a block of buildings shall be erected on a site which includes the stable-yard at the corner of Market-street and the Turl, the old lecture-room behind, and the two adjoining houses with shops under in the Turl. Mr. Herbert Read, F.R.I.B.A., of 16, Cork-street, W.1, the architect to the college, who designed the building which now houses the senior and junior libraries of the college, has prepared the plans and elevations of the suggested buildings which we illustrate this week. These would furnish the college with 27 additional sets of rooms, and so raise the number of lodgings available for undergraduates in college from 57 to 84, which would entirely meet the needs of the college in this respect. The site at present occupied by Hedderley's shop on the ground floor and the Rector's Lodgings above is required for the complete scheme for 27 sets of rooms, and it is for this reason that the provision of another house for the Rector is a necessary part of the complete scheme. It is therefore proposed to erect a suitable house for the Rector in that part of the Fellows' Garden nearest to All Saints' Church, and elevations of this proposed house to the Turl, and to the garden, accompany the plans and elevations of the other buildings. The cost of the whole scheme is estimated by the architect at £43,000.

Lincoln College, Oxford: Proposed Buildings.

MR. HERBERT READ, F.R.I.B.A., Architect.

House at Chalfont.

This is a preliminary design for a house which has been built to a rather different plan and elevation. The general contractors are Messrs. H. G. Cooper, Ltd., and the work has been carried out under the superintendence of the architect, Mr. Hubert Lidbetter, F.R.I.B.A.

Competition for New Offices for the Wiltshire Working Men's Conservative Benefit Society.

The full awards in this competition are given on page 802. The main conditions which governed the first premiated design were that the general offices had to be capable of supervision from any point, especially from the Assistant Secretary's office, and that the public were only to have access to the enquiry counter and the cashier's office. The side portions of the general office are kept low, and the central portion is taken up to allow for clerestory lighting. The various departments are divided by means of glazed partitions extending to the ceiling. On the first floor the board room is placed over the central portion of the general office, thus obtaining lighting from three sides, and more freedom from street noises than had it been placed on the main front of the building. The caretaker's quarters are divided between the first and second floors to utilise roof space.

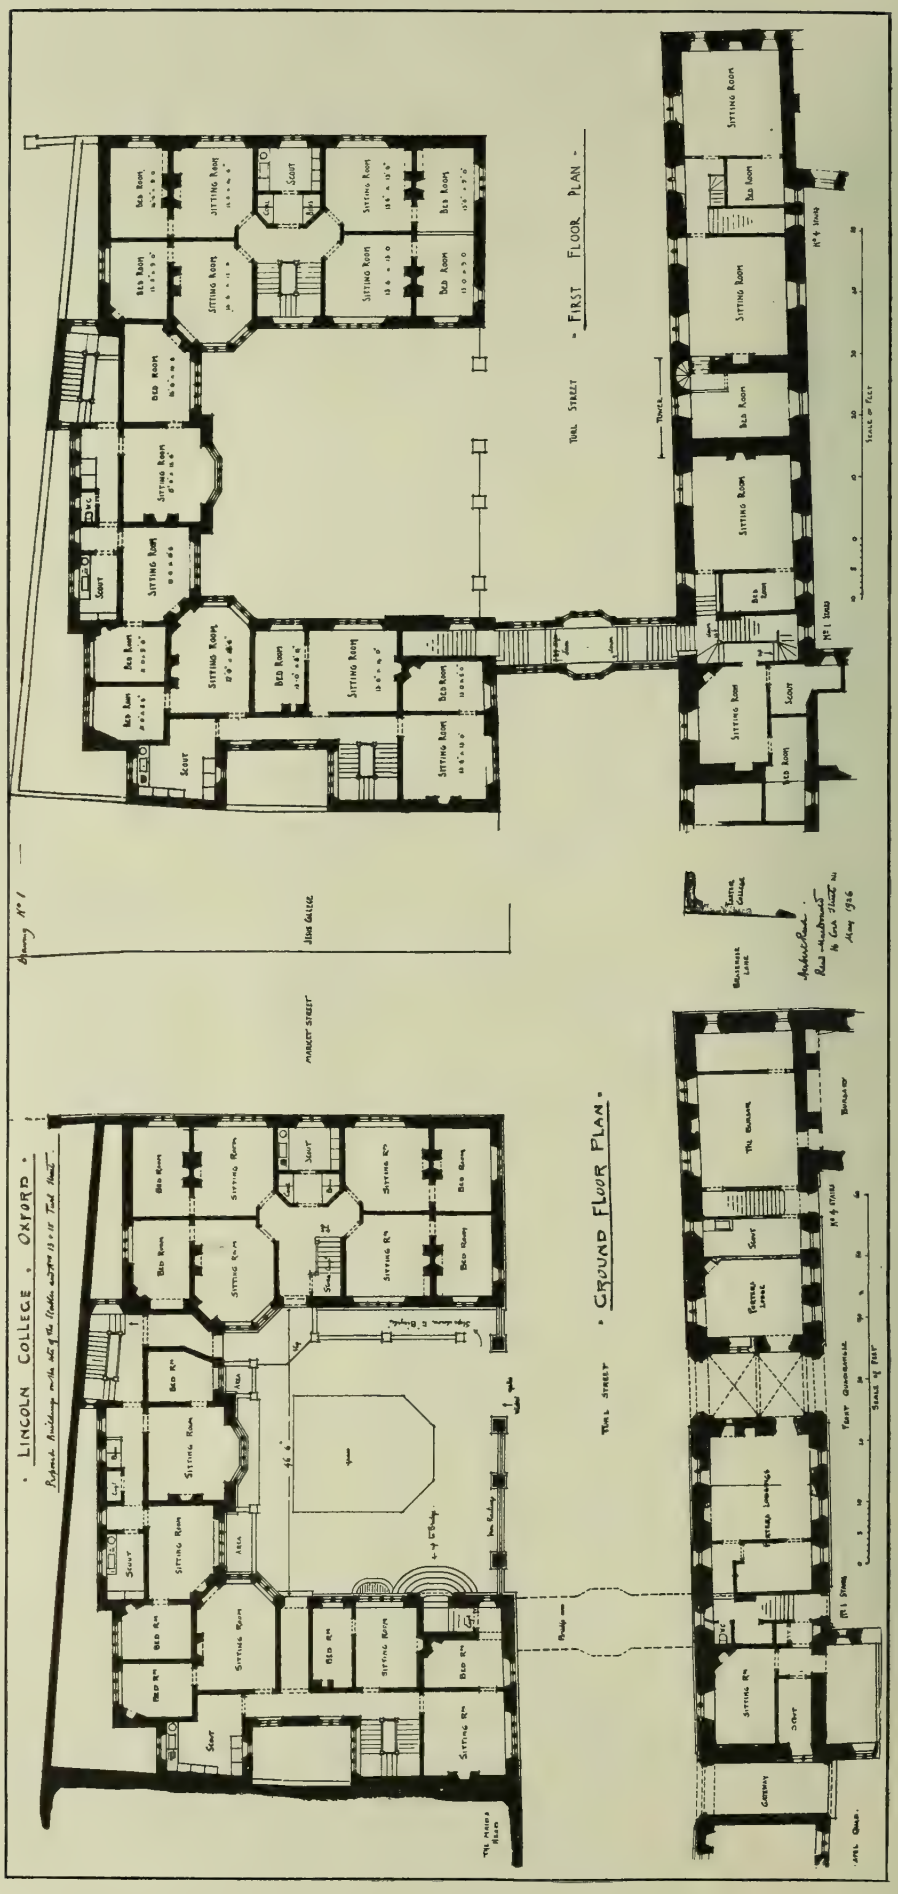
Messrs. Lander and Tanner, A.A.R.I.B.A., are the successful architects. The elevations are in coursed ashlar of local stone with a steeply pitched roof, and have been kept as simple as possible, as it was not desired to incur unnecessary expense.

Royal Society of Arts.

The work of refacing the rear wall of the premises of the Royal Society of Arts in Durham House-street, Strand, has been carried out from the designs of Sir Aston Webb and Son. The cost of decorating the wall has been borne by Sir George Sutton, a vice-president.

Messrs. E. J. & A. T. Bradford were responsible for the new elevation. They modelled the enrichment in stucco to represent stone fixed on the old stone walls. They specially modelled the three figure panels, "Music," "Painting," and "Education." Messrs. Dove Brothers were responsible for scaffolding and builders' work.

Raffles College, Singapore: Administration Block.



This block is entered off a porte cochère, off which open the administrative offices. The staircase on the axial line opposite the porte cochère leads to the great hall on the first floor, which is about 112 ft. by 52 ft. by 44 ft. to the crown of the barrel vaulting. A library will be housed at the gallery level.

Messrs. Cyril A. Farey, A.R.I.B.A., and Graham R. Dawbarn, M.A., A.R.I.B.A., M.I.Struct.E., are the associated architects; and Messrs. Swan and MacLaren, of Singapore, the supervising architects.

The general contractors are Messrs. Wee Tiam Ghee. Among the sub-contractors are: Messrs. Redpath, Brown and Co., constructional steelwork; British Reinforced Concrete Engineering Co., Ltd., reinforcement; Messrs. Jenkins (Torquay), marble paving.

A House at Chislehurst.

"Hoblands," Chislehurst, Kent, is a fair-sized country house of Georgian character. Mr. Fred Harrild, F.R.I.B.A., being the architect.

THE REGISTRATION BILL IN PARLIAMENT

The first meeting of the Select Committee appointed to consider the Architects (Registration) Bill was held at the House of Commons on Thursday last week, Sir C. Kinloch-Cooke presided, and the other members were:—Mr. Gardner, Sir Alfred Hopkinson, Mr. Lindley, Sir Murdoch Macdonald, Colonel Moore, Sir Frederick Rice, Mr. Tasker, Mr. Viant, Captain Wallace, and Dr. Watts.

Evidence was given on behalf of the Royal Institute of British Architects by Major Harry Barnes, the Chairman of the Registration Committee of the Institute. Major Barnes told the Committee that he was authorised by the Institute to say that, in accordance with the undertaking given on their behalf during the second reading of the Bill in the House of Commons, they were prepared to qualify the term "architect" as used in the Bill. It was only natural that they did so with considerable reluctance. Words such as "authorised," "recognised," and "statutory" had been suggested by members of the Institute, but they considered that it was impossible to find one to which less objection would be taken than the word "registered." The use of the word "registered" as a qualification would appear to remove all the opposition to the Bill, and would have the effect of changing the register from a compulsory register to a voluntary register. As the Bill stood, persons were considered to be registered who were entitled to be registered, and it might have the effect of putting on the register persons who did not desire to be put on. It was, therefore, proposed that persons desiring to be put on the register should have to make application, so that no one would be put on against his will. The adoption of the term "registered architect" would remove the fear expressed on behalf of local authorities that the Bill would interfere with their officials; it would remove the apprehension of the civil engineers that they would not be allowed to use freely and unrestricted the term "architect" in connection with their work; and it would also remove the apprehensions of the co-operative societies that, by placing a restriction on the use of the word "architect," the Bill would interfere with certain departments of their work.

A number of amendments consequential on the adoption of the term "registered architect" had become necessary. In addition to these, the Institute had prepared other amendments for the consideration of the Committee. It was proposed to amend the clause relating to the Admission Committee for the regulation of entry to the register. Several applications had been made by bodies not at present included in the schedule laying down the constitution of the Admission Committee, and it was proposed to add the names of the National Association of Auctioneers, House Agents, Rating Surveyors and Valuers, the Land Agents' Society, and the Faculty of Architects and Surveyors.

The Chairman said he noticed that it was proposed to take Northern Ireland out of the Bill.

Major Barnes: The architects of Northern Ireland wish to have conditions of registration adapted to their own position, and it has not been found possible, within the range of the Bill, to make such modifications as they desire. Consequently, it is suggested that Northern Ireland should be left out of the Bill in order that they may proceed with a measure of their own.

Going on to deal with other amendments proposed by the Institute, Major Barnes said it was felt that, as registration was not to be compulsory, a fee might be charged. The disciplinary powers provided under the Bill would, of course, only apply to members on the register. In connection with the constitution of the Board of Architectural Education, provided for in the first schedule to the Bill, it was proposed that, instead of three representatives being nominated by the National Association of Art Masters, two should be nominated by the Association of Technical Institutions and one by the National Association of Art Masters. The Faculty of Architects and Surveyors and the National Federation of Building Trades Operatives were to be added to the Board.

Witness next explained the part taken by the Institute in drawing up the Bill. The Council of the Institute was entrusted with setting up the register. The Admission Committee would control the entrance of all men at present in practice, or assistants or students. The Board of Architectural Education would control those who might become students after the passing of the Act. The Discipline Committee would control removal from the register. In framing the Bill, regard had been had to the fact that there were men at present in practice who were members of bodies other than the Institute, and steps had been taken to insure that the admission of such persons should be as free and open as in the case of any other person. The Admission Committee was, therefore, made up of representatives of every body from whose representatives admission was likely to be sought. The Board of Architectural Education had been constructed on the general principle that the profession should be open to all classes and that it should be possible to enter the profession from any level of society, and that a standard of educational value should be set up. It would represent every educational stage.

A member of the Committee asked whether there was to be any representative of the Workers' Educational Association.

Major Barnes: That is not at present provided for in the Bill. Reference was made to that body during the second reading debate, and it will be entirely in keeping with the views of the Institutes if such a representative is appointed.

The machinery for the removal of members from the register, the witness continued, was set up on the principles followed in other professions. It was proposed to safeguard the position of every one on the register by making the Discipline Committee contain not only a number of his peers but also persons entirely apart from the profession. There would be three registered persons and two others, one appointed by the Minister of Health (who might be regarded as a representative of the general body of citizens), and the other appointed by the President of the Law Society (who might be regarded as a representative to see that the case had a proper hearing). The witness also explained to the Committee the constitution of the Institute and the precedents existing in other professions for placing registration in the hands of such a body.

Mr. Tasker asked witness whether the Institute had ever done anything to help the designing of steel-framed buildings.

Major Barnes said that such work did not fall on the Institute as a body, but was a question for individual members. He could not, he added, be expected to be familiar with the detailed working of the Institute.

Replying to a further question by Mr. Tasker, witness said that he was not aware of any matter having come before the Council which could be considered as bringing to their notice questions of neglect on the part of District Surveyors.

Mr. Tasker: Did not your Institute on one occasion instruct learned counsel in connection with a Bill where the use of ferro-concrete was involved?

Major Barnes said that the Institute acted together with other bodies on that occasion, and succeeded in getting a substantial concession in the matter.

The Chairman suggested that these matters did not affect the Bill under discussion and that Mr. Tasker was not entitled, during the course of examining the witness, to attack the Institute.

Mr. Tasker said the Bill was designed to exclude civil engineers and other professions from carrying out architectural work, and in their interests he must put questions as to the attitude of the Institute towards them.

The Chairman said that any such body as the civil engineers could come forward and give evidence on that subject if they chose, and it would be more appropriate to address such questions to them.

Mr. Tasker said he had no desire to attack the Institute.

After some further discussion between members of the committee as to whether it was desirable that questions relating to the detailed work of the Science Committee of the Institute should be addressed to witness, it was finally agreed that the points which Mr. Tasker wished to raise should be handed to Major Barnes in writing and an opportunity given at a later sitting for the considered answers to be discussed.

Mr. Tasker then put to witness questions relating to the general purposes of the Bill and asked whether it were not one of the principal objects of the Bill to eliminate men who had no training whatever.

Major Barnes: The present generation, you might roughly say, are not affected by the Bill. It is more for the benefit of future generations.

Answering Captain Wallace, Major Barnes said that, although they would prefer the word "chartered" to "registered," he did not think it could be put in the Bill because there would be the difficulty of persons who were members of the Institute having the right to be called "chartered" by reason of their membership of the Institute which held a charter, and at the same time prevented from calling themselves chartered by reason of the Bill.

The Committee adjourned.

TOWN PLANNING IN ENGLAND AND WALES

We have received from the Town-Planning Department of the Ministry of Health a List of Local Authorities engaged in the preparation of town-planning schemes, showing the stage reached in each case. Analysis of this list provides the following information:—

359 local authorities have passed a resolution deciding to prepare a scheme, or received the Minister's approval or authority, where required, but no Preliminary Statement or Scheme has yet been approved by the Minister.

In 59 cases the Preliminary Statement of proposals for development has been submitted but has not yet been approved by the Minister.

In 66 cases the Preliminary Statement has been approved by the Minister.

In 11 cases the Scheme itself has been submitted but has not yet been approved by the Minister.

In 23 cases the Scheme has been finally approved by the Minister and become operative.

In 120 cases the Authority themselves are not preparing a Scheme, but a portion of their district is included in the area of a Scheme being prepared by another Authority, the name of which is shown in brackets.

The following statement of town planning progress in England and Wales for the month ended April 30th, 1927, is issued by the Town Planning Department of the Ministry of Health:—

Preliminary Statements approved (Stage BB).—Devonshire: Totnes T.C. Surrey: Epsom R.D.C. (Cheam), Epsom R.D.C. (Banstead and Woodmansterne).

Preliminary Statement submitted (Stage B).—Essex: Harwich T.C.

Resolutions received (Stage A).—Hertford: Watford T.C. Sussex: Bexhill T.C.

SOCIETIES AND INSTITUTIONS

ROYAL SCHOOL OF ENGINEERING, IZA, CAIRO, SOCIETY OF ARCHITECTS

The inaugural meeting of the Society of rchitects attached to the Royal School of ngineering, Giza, Cairo, was held on April 4th, when the presidential address was read y Professor A. F. Wickenden, F.R.I.B.A. pening his paper, the president said it emed to him that the training of archi- cts presented a much more difficult roblem than the training of men for any her profession, the reason being that it as so difficult to find a sure foundation or asis upon which to work. There were so any different opinions as to what was ally meant by architecture. He was one those who were strongly of opinion that chitecture must be considered in very ose relationship to building construction, cause the ultimate aim of every architect ould be, and surely was, to produce not erely a series of designs and drawings but tual buildings. If it was so troublesome find a clearly defined idea as to what nstituted architecture, it followed that it ust be equally difficult to state the sential qualifications of an architect, and at, in his experience, was the great trouble an architectural student. It meant that most cases he did not know exactly what was aiming at, and in consequence as in great danger of ending his riod of training as a very common- ace artist with a most incomplete know- dge of science.

The requirements of an architect varied nsiderably according to the different actices and methods adopted in the par- ular country or locality in which he ppened to work. In one place, for ample, the architect might have to design d be responsible for the supervision of construction of the building from undations to roof, and everything connected ith the building, while in other places he ight, perhaps, do very little more than ake the best of a structural engineer's plan d design an elevation to fit an engineer- g framework.

The speaker then briefly suggested a few aracteristics which, in his opinion, were cessary to enable a person to be really ccessful in the practice of architecture. e thought we must place first "imagina- n," the creative faculty of the mind, for less a man possessed, or was able to velop power of imagination, he would never roduce any original architectural work of eat merit, except, perhaps, in rare cases accident.

The speaker next grouped together an tistic temperament, a scientific mind, and live interest in craftsmanship; an artistic mperament, which compelled a full preciation of beauty of form and colour; scientific mind, which demanded the gical testing of theory; first-hand know- dge of the handiwork in the various rts, which translated the creations of the ind into realities. Next he would place abounded ambition and undying en- usiasm: the continual desire to produce mething or to do something better than e had ever produced or accomplished fore, and that spirit of enthusiasm which abled one to remain keen and carry on in ite of disappointment. The practice of chitecture was full of disappointments. true artist was nearly always disappointed, some extent, with the finished results of s work. He strongly urged his hearers to ke full advantage of enthusiasm while it s strongest, in the early years of their reers. Last, but not least in importance, specified practical business ability, which ould make the architect realise that his ilding scheme or proposal must not only structurally sound but also financially und. If architects were to develop their siness abilities to a greater extent, a much greater value would be placed upon their services by the general public.

While it might, perhaps, be comparatively easy to be an architect in part, it was extremely difficult to be a complete architect, and to accomplish such a feat meant a long and careful period of training and a lifetime of practice.

The fact that there was so much that a student could do, and ought to do during his period of training, made it absolutely necessary that there should not be too much time and energy spent on matters of minor importance. In the training of architectural students one of the greatest dangers of wastage always had been, and he supposed always would be, in the matter of draughtsmanship. In his student days he was most enthusiastic over good drawing and rendering, and he still fully appreciated their very great value, especially in the early years of training. Beyond a certain reasonable point, however, during the later years of studentship, drawing and rendering might very easily become sheer waste of time, energy, and drawing materials. Students should learn to use discretion as to when elaborate draughtsmanship was necessary and when it was not.

Another source of danger to which architectural students were, in his opinion, exposed was that of becoming too theoretically minded in dealing with design and composition. The safe and useful rules governing architectural design were comparatively few in number, but the vague theories and ever-changing individual opinions were unlimited in number. Once they had mastered the few fundamental principles he advised them to learn to think for themselves and not be afraid of being original. By doing this they would have many failures, they would meet with much violent criticism, especially from brother architects, but if they achieved only one real success in life they would not have lived in vain.

AUCTIONEERS' AND ESTATE AGENTS' INSTITUTE.

At a Council Meeting of the Auctioneers' and Estate Agents' Institute at the Institute, Lincoln's Inn Fields, Mr. Alfred J. Burrows (Messrs. Knight, Frank & Rutley), of London and Ashford, has been unanimously elected President for the ensuing year. The following Vice-Presidents have been also elected: Messrs. Hubert Alexander (Messrs. Stephenson & Alexander), Cardiff; Arthur C. Driver (Messrs. Drivers, Jonas & Co.), London; C. Roland Field (Messrs. Field & Sons), London; J. Edward Kitchen (Messrs. Oliver, Appleton & Kitchen), Leeds; Geo. F. Page, J.P. (Messrs. Nightingale, Page & Bennett), Kingston-on-Thames; Sir Anker Simmons, K.B.E., J.P., Henley-on-Thames.

There were 1,039 entries for this Institute's Examinations last March, of whom 618 have passed, being eight in the Direct Final Division, 182 Final Division, 325 Intermediate Division, and 102 Preliminary Division.

INSTITUTION OF CIVIL ENGINEERS.

The Council of the Institution of Civil Engineers have made the following awards in respect of papers read and discussed at the ordinary meetings during the session 1926-27:—

Telford Gold Medals to Mr. I. J. Jones, M.Inst.C.E. (London), and Mr. T. B. Hunter, O.B.E., M.Inst.C.E. (London); a Watt Gold Medal to Mr. Gerald Curry, M.Inst.C.E. (London); and a George Stephenson Gold Medal to Mr. A. L. Bell, M.Sc., B.A., M.Inst.C.E. (Malta); Telford Premiums to Mr. A. W. Stonebridge, M.Inst.C.E. (Bombay); Mr. P. R. Roberts (Barrow-in-Furness); Mr. A. C. Anderson, O.B.E., M.Inst.C.E. (London), and Mr. George Ellson, O.B.E., M.Inst.C.E. (London); a Manby Premium to Professor Douglas Hay, M.C., B.Sc., M.Inst.C.E. (Sheffield); and a Trevithick Premium to Mr. Powys Davies, Assoc.M.Inst.C.E. (India).

At the Annual General Meeting of the Institution of Civil Engineers held on Tuesday evening, May 10, the result of the ballot for the election of officers was declared as follows:—

President: Mr. Ernest Frederic Crosbie Trench, C.B.E., M.A., B.A.I. (London).

Vice-Presidents: Sir Archibald Denny, Bart. (London); Sir Brodie Haldane Henderson, K.C.M.G., C.B. (London); Sir John Francis Cleverton Snell, G.B.E. (London); Mr. George William Humphreys, C.B.E. (London).

Other members of Council: Mr. Robert Donald Thain Alexander, D.S.O., O.B.E. (India); Mr. Henry Newmarch Allott (Manchester); Mr. Thomas Henry Bailey (Wokingham); Mr. William James Eames Binnie, M.A. (London); Sir Dugald Clerk, K.B.E., D.Sc., F.R.S. (London); Col. Rookes Evelyn Bell Crompton, C.B., Col. R.E. (T.) (London), Professor William Ernest Dalby, M.A., B.Sc., F.R.S. (London); Mr. Sydney Bryan Donkin (London); Sir Alexander Gibb, G.B.E., C.B. (London); Mr. William Wylie Grierson, C.B.E. (Ticehurst); Sir Robert Abbott Hadfield, Bart., D.Sc., D.Met., F.R.S. (London); Mr. Ernest Prescot Hill (London); Sir Clement Daniel Maggs Hindley, M.A. (India); Mr. Thomas William Keele (Australia); Sir Cyril Reginald Sutton Kirkpatrick (London); Mr. David Ernest Lloyd-Davies (South Africa); Sir Murdoch MacDonald, K.C.M.G., C.B., M.P. (London); Sir Henry Percy Maybury, K.C.M.G., C.B. (London); Sir Richard Augustine Studdert Redmayne, K.C.B., M.Sc. (London); Mr. Henry Ashman Reed (Manchester); Sir Hugh Reid, Bart., C.B.E., LL.D. (Glasgow); Professor Robert Julian Scott (New Zealand); Mr. William Archer Porter Tait, B.Sc. (Edinburgh); Mr. Henry Hague Vaughan (Canada); Mr. John Duncan Watson (Birmingham); Sir Alfred Fernandez Yarrow, Bart., F.R.S. (London).

This Council will take office on the first Tuesday in November, 1927.

THE NORTHERN POLYTECHNIC.

We are informed that the following firms, institutions and individuals have contributed to the prize fund for the Architectural and Building Department of the Northern Polytechnic during the past session:—London Master Builders, 10 guineas; Messrs. Dent and Hellyer, one guinea; Messrs. Smeaton and Hamlin, 7s. 6d.; the Glico Petroleum Co., three guineas; Mr. H. R. Selley (Messrs. Swain and Selley), one guinea; National Joint Council for the Plastering Ind., £2; Mr. A. Adamson, one guinea; Messrs. F. G. Minter, Ltd., two guineas; Messrs. Tiranti, Ltd., book prizes; National Association of Shopfitters, three guineas; "Mary Edis" (Mrs. T. P. Bennett), two guineas; the Association of Master Plumbers, one guinea; Mr. F. J. Wittamore, £1; Mr. F. R. Hiorns, one guinea; Mr. Archibald Campbell, two guineas; the Silicate Paint Co., one guinea; Messrs. James and Bywaters, one guinea; Messrs. A. Sanderson and Sons, three guineas; Messrs. R. W. Greeff and Co., £5; Messrs. G. M. Whiley, Ltd., £3.

British Architects' Conference.

The Annual Conference of British Architects will take place in London from June 20 to June 25 (inclusive). All members of the R.I.B.A., the Architectural Association, and the Allied Societies in Great Britain, Ireland, and Overseas are invited to take part in the conference. It is hoped that many ladies will be present, as guests of members, at all the events contained in the programme. Members are particularly requested to make a note of the date, and to keep themselves free from other engagements. A complete programme with full particulars will be issued in the near future to all the members of the bodies mentioned above.

THE BATH CORPORATION ACT, 1925.

"THE BATH CLAUSE."

We take the following from the current issue of the R.I.B.A. Journal:—

Extract from the Bath Corporation Act, 1925. Clause 128.

Further power to make by-laws as to new buildings, etc.

128.—(1) (*a*) For the purpose of assisting the Corporation in the exercise of the powers conferred upon them by this section a standing advisory committee of three members (in this section called "the advisory committee") shall be constituted for the city of whom one member shall be a Fellow of the Royal Institute of British Architects to be nominated by the President of the said Institute one member shall be a Fellow of the Surveyors' Institution to be nominated by the President of the said Institution and one member shall be a justice of the peace to be nominated by the council:

Provided that a member of the council shall be disqualified from being a member of the advisory committee.

(*b*) Subject as aforesaid the members of the advisory committee shall be appointed by the council and any vacancy occurring on the advisory committee shall be filled by the council on the nomination of the person or body by whom the members causing the vacancy was nominated. The Corporation shall pay the members of the advisory committee such reasonable fees and expenses as the Corporation think fit.

(*c*) The advisory committee may determine any matter referred to them in such manner as they in their discretion shall think fit and they shall within one month after the receipt of the reference give their decision thereon and any such decision shall have effect as if it were an approval or disapproval (as the case may be) of the Corporation and in the latter case shall contain a statement of the grounds on which the decision is arrived at.

(*d*) Every such decision shall forthwith be reported to the Corporation and upon receipt thereof by the Corporation a copy shall forthwith be sent by the Corporation to the person or persons affected thereby.

(*e*) In the event of a division of opinion among the members of the advisory committee upon reference to them the matter shall be decided by a majority of votes of the members of the committee but save as aforesaid the advisory committee shall act by their whole number.

(*f*) The costs of any reference to the advisory committee shall be paid as the advisory committee may direct. Where such costs or part thereof shall be payable to any person other than the Corporation they shall be recoverable by that person and where such costs or part thereof shall be payable to the Corporation they shall be recoverable by the Corporation and in both cases summarily as a civil debt

(2) Section 157 (Power to make by-laws respecting new buildings, etc.) of the Public Health Act, 1875, is hereby extended so as to enable the Corporation to make by-laws providing in such manner as they may think necessary for the deposit by a person intending to construct—

(*a*) a building within the city; or

(*b*) an addition to an existing building within the city (including the reconstruction of an existing addition to any such building); or

(*c*) a chimney exceeding forty-five feet from the ground in height;

of drawings of the elevations and particulars as to the materials of such building or addition or chimney (in this section called collectively "elevations").

(3) Where elevations are required to be submitted to the Corporation by a by-law made under the said section 157 as extended by this section the Corporation shall within one month after the delivery of the elevations—

(*a*) approve the elevations; or

(*b*) if they shall consider that having regard to the general character of the buildings in the city or of the buildings proposed therein to be erected or of the building upon or to which the addition is to be constructed or reconstructed the building or addition or chimney to which the elevations relate would seriously disfigure the city whether by reason of the height of the building or addition or chimney or its design or the materials proposed to be used in its construction refer the question of the approval of the elevations to the advisory committee for their decision thereon and the reference shall be accompanied by a statement of the grounds on which the proposed building or addition or chimney is considered to be objectionable.

(4) The Corporation shall forthwith send notice in writing to the person by whom the elevations were deposited of their approval thereof or if the building or addition or chimney is considered to be objectionable on any of the grounds mentioned in this section of the reference of the elevations to the advisory committee and the notice shall be accompanied by a statement of the objections to the building or addition or chimney.

(5) The person by whom the elevations were deposited shall be entitled to send to the advisory committee a statement of his answers to the objections of the Corporation and if he does so he shall at the same time send a copy thereof to the town clerk.

(6) Where the elevations of a building or addition or chimney have been disapproved under this section it shall not be lawful to erect the building or addition or chimney until the elevations thereof have been approved by the Corporation and any person who acts in contravention of this section shall be liable to a penalty not exceeding five pounds and to a daily penalty not exceeding two pounds.

(7) The provisions of paragraph (*b*) of subsection (2) of this section shall not apply to a wooden hoarding which is used solely for the purpose of bill posting.

THE WEEK IN PARLIAMENT.

Westminster, *Wednesday.*

New Bridges.

Colonel Ashley, the Minister of Transport, stated, during a debate, that he was extremely anxious that in 200 years' time our descendants should not make disparaging remarks of the new bridges which had been built recently. Some extraordinarily fine bridges had been handed down to us, and it was our duty to see that the next generation had bridges worthy of us. At Berwick-on-Tweed a very fine bridge was rising up of reinforced concrete, which would be opened in November or December. It had a span of 365, the biggest concrete span in the country. Farther south, there was the great steel structure between Gateshead and Newcastle, which would be finished very shortly afterwards. It had one steel span with lifts going up on each side. He had always insisted that both in the major and minor bridges, a competent architect should be engaged in order that the design of the bridge should be worthy of the situation. It was a small extra expenditure, and it did give a good design. It was possible, in regard to the smaller bridges made with reinforced concrete, for the concrete to be so tinted as to harmonise with the natural landscape, and not be of that cold, grey colour which reinforced concrete had been during the last few years.

Building Materials Prices.

Mr. Morrison asked the Minister of Health whether he had now received the special Report of the Committee on Prices of Building Materials as to why the prices of bric and other building materials were s higher than before the coal stoppage.

Mr. Chamberlain: "No, sir. I und stand, however, that various materials, cluding common bricks, have recently fal in price, and that the Committee propose issue a report setting out prices current May 1, pending the completion of their vestigation."

Steel Houses.

Viscountess Astor asked the Minister Health, whether the Weir and Atholl syste of steel construction for houses had yet b submitted for expert investigation by Building Research Board; and, if so, wh the reports on those systems would be p lished.

Mr. Chamberlain said that the Weir s tem was examined in detail and repor upon in November, 1924, by the Commit presided over by Sir Ernest Moir, wh consisted largely of experts, and it had been thought necessary to refer that meth of construction to any other body for c sideration. The Atholl system was recen examined by officers of his department a the Department of Building Research wit view to fixing a loan period for houses bu in accordance with it, but he had not received their report.

Houses Completed.

Mr. Chamberlain, in reply to Mr. Tayl gave the following statement showing t number of houses completed during ea year, ending in March, since 1919:—

Year	With State assistance	Without State assistance	Total
1920	715		
1921	28,549	53,800 (a)	251,98
1922	101,071		
1923	67,853		
1924	18,664	67,546	86,21
1925	67,569	69,220	136,88
1926	106,987	66,439	173,42
1927	153,779	64,200 (b)	217,97
Total	545,287	321,205	866,49

(A) Separate figures are not available the years 1920-1923, and the number based partly on an estimate.

(B) This figure includes an estimate 33,000 for the half-year ended March 1927. Final figures for this half-year not yet available.

Design of Buildings.

Viscountess Astor asked if the city Bath had yet set up the advisory commi to control the design of buildings as t were empowered to do under the Bath poration Act of 1924; and whether sim committees had yet been set up at Ru and Oxford.

Mr. Chamberlain said that Bath obtai the powers in 1925; the Council had not established an advisory committee, pen the settlement of new by-laws. Oxford not obtained similar powers, but propose do so in their town-planning scheme. Ruislip-Northwood Council, under a to planning scheme of 1914, might require terations in the elevations of buildings there was a dispute the matter was to settled by an arbitrator appointed by president of the Royal Institute of Bri Architects. There was no advisory mittee.

Bequest for Stained Glass.

Mr. John Lindon, of Bidston-road, Ox Birkenhead, plumber, who died on M 4, left estate of the gross value of £18. with net personalty £17,021. He left an other bequests, £900 to the Bishop of Roman Catholic Diocese of Shrewsbury adding eight stained glass windows in stitution for the present plain lead li in the chapel attached to the Church of Holy Name, Beresford Road, Claughton

NSTITUTION OF STRUCTURAL ENGINEERS

PROBLEMS IN THE DESIGN OF STEEL ROOF TRUSS MEMBERS

A paper on this subject was read by Mr. A. G. gsley, B.Sc., A.M.I.Struct.E., before the titution of Structural Engineers on Thursday, y 12. In the course of some introductory narks. the speaker said that in the design steel roof truss members but little con-eration was usually given to the bending ions which often occur. The most important these might be conveniently grouped under following heads :—

1) Lateral loading on rafters.
2) Eccentricity of riveting.
3) Non-intersection of axes of members at joints.
4) Rigidity of joints and deformation of truss under load.

We give below the lecturer's remarks on eral loading on rafters. The location of clins on the rafter members at points other n the so-called joints or panel points, said lecturer, introduced bending actions of ne importance. Adhering to the principal umption of hinged joints, the general practice s to estimate the bending moment acting on the rafter by treating it as a series of ple spans from panel point to panel point. g. 1 shows the bending moment diagram tained in this manner for a rafter of three nel lengths under the lateral loading indicated h purlins mid-way between panel points.

The very general use of rafter members con-uous from the shoe to the ridge of a roof ss had an important effect upon the con-ions of bending in this case. Thus under components of the resultant purlin loads mal to the slope of the roof, the rafter acted newhat as a beam continuous over level ports at the panel points and partially fixed the shoe and ridge connections. Fig. 2 ows the bending moment diagram for the ter of Fig. 1 treated as continuous and ely supported at its ends. Fig. 3 shows conditions for the same rafter considered rigidly fixed at the shoe and ridge connec-ns. It would be seen that the immediate ect of continuity of the rafter was to reduce e magnitude of the bending actions. Table A ows the results of a similar treatment of eral bending in a series of typical rafters der simple transverse loading ; the maximum nding moment occurring in each case was pressed in this table as a percentage of the rresponding maximum bending moment curring in the rafter when treated as a series simple spans as in Fig. 1.

The values given in this Table A were sed upon calculations involving Clapeyron's eorem of Three Moments. Yet it was clear t, owing to the deflection of the truss under d, this Theorem would not strictly apply ; the panel points would not generally lie in same straight line. Effects corresponding those produced by the subsidence of a support der a continuous girder might be expected, l the investigation of the problem would ceed on the same lines. Considering two acent spans of lengths L_1 and L_2, in which intermediate support fell below the line ing the end supports by h, the calculation the bending moments might be carried out Clapeyron's equation extended to include additional term, so that, using the common ation and appropriate signs, the equation ame—

$$B_A L_1 + 2B_B(L_1+L_2) + B_C L_2 = \frac{6A_1X_1}{L_1} + \frac{6A_2X_2}{L_2} - 6EIh\left(\frac{I}{L_1}+\frac{I}{L_2}\right)$$

ere B_A, B_B and B_C were reverse or support nding moments at three successive suppports B and C.

n most cases for a rafter $L_1=L_2=L$; and ming this and writing $6B=B_A+4B_B+B_C$ $6X=6A_1X_1/L^2+6A_2X_2/L^2$ the above equa-n reduced to—

$$B = X - \frac{2EIh}{L^2}$$

In this equation, B represented a hypothetical bending moment approximating in magnitude to an average of B_A, B_B and B_C supposing that these did not widely differ in value ; X was a term dependent only upon the magnitude and distribution of the transverse loading on the two spans and the panel lengths of the rafter ; and $2EIh/L^2$ was a term representing the effect of the deviation of the panel points from a straight line upon the typical bending moment B. It would be convenient to rewrite this last term as $2E(I/L)(h/L)$. The stiffness (I/L) for a rafter member in a ridged steel roof truss normally varied from 1/10 to 1/30, and might be taken as 1/20 for an average value. The value of (h/L) in a truss under working loads might be estimated from the calculated deflections of the panel points along a rafter, and from a few such calculations a value of 1/2000 seemed a fair approximation as an average maximum value over two adjacent panel lengths. Hence, taking E as 13,400 tons per sq. in., the value of the term $2EIh/L^2$ was of the order of 0.7 tons-ins. This was quite clearly a small bending effect in comparison with the direct bending actions of the transverse loading represented by the term X ; so that the results obtained by treating the rafter as a continuous beam would not be far in error from this cause.

Referring again to the assumptions upon which the calculations embodied in Table A were based, the question of the degree of fixity of the ends of the rafter at the shoe and ridge arose. At the shoe the rafter would usually be connected to a comparatively rigid stanchion ; so that the degree of rigidity would mainly depend upon that of the connection. At the ridge, however, where the joint was normally of a decidedly rigid type, the principal factor affecting the fixity imparted to the rafter would be the possibility of unequal loading upon the intersecting rafter members.

Consideration of the values given in Table A in the light of the above modifying factors alone would lead one to suggest an allowance in design for some 80 per cent. of the simple transverse bending moment. But there remained to be considered in this connection the effects of the direct compressive force in the rafter and the stiffening action of the secondary struts and ties of the web of the truss.

The direct thrust would tend to increase the bending of the rafter under its transverse loads. Considering a rafter panel length as

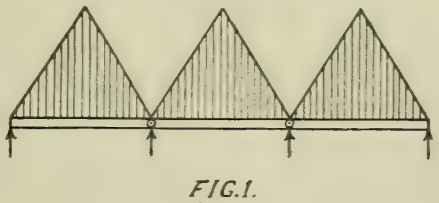

FIG.1.

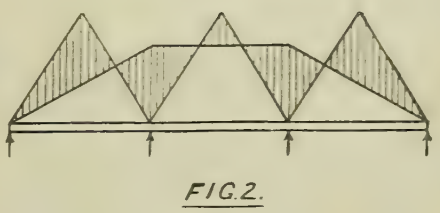

FIG.2.

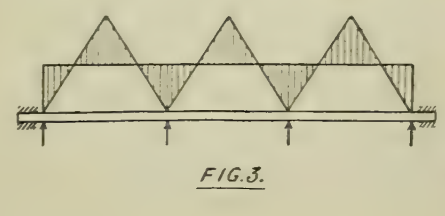

FIG.3.

TABLE A.

Type of Loading.	Length of Rafter.		B_1.	B_2.	B_3.
I.	2L	½WL	75	50	
I.	3L	½WL	70	50	
I.	4L	½WL	68	50	
I.	5L	½WL	68	50	
II.	2L	⅝WL	83	67	
II.	4L	⅝WL	76	67	
III.	2L	¾WL	100	67	
III.	4L	¾WL	86	67	
IV.	2L	⅞WL	100	67	
IV.	3L	⅞WL	80	67	
IV.	4L	⅞WL	86	67	
IV.	5L	⅞WL	84	67	

a strut of length L, and moment of inertia I under a direct compressive force P, the lateral bending moment would be increased by the ratio—

$$\frac{I}{1-\frac{PL^2}{cEI}}$$

in this expression, having regard to the partial fixity of the ends of the strut, the constant c would have a value of about 20. By the application of this approximate expression to several typical rafter members. the effect of the direct thrust was found to increase the transverse bending action by from 5 to 15 per cent.

Lateral loading on a rafter would tend to change its slope at the panel points ; and such changes would be resisted by the stiffness of the web members acting through more or less rigid connections. But having regard to the relative stiffness of the rafter and the web members in an ordinary roof truss, it was apparent that this stiffening action would be comparatively small. Furthermore, for transverse loading symmetrical about the panel points, the rafter at these points would undergo no change of slope, and in this case the web members would not be called upon to resist any bending. No general allowance, therefore, could be made for this effect in ordinary design. Consideration of these further modifying factors upon the bending in the rafter suggested an increase of the previously estimated bending moment to about 90 per cent. of the simple transverse bending moment. So that the usual assumption of a moment equal to the simple transverse bending moment would appear to be quite a satisfactory approximation for purposes of design.

An indirect effect of the continuity of a rafter under lateral loading might be noted ; where the purlins bore upon the rafter members at other than the panel points, this continuity would affect the transmission of the loading to the panel points. The distribution of the loading in such cases was ordinarily obtained by considering the rafter as a series of simple spans ; but by treating the rafter as continuous over level supports and free at the ends, values of the resultant panel point loads were obtained exceeding the usual estimation by 10 to 40 per cent. at the central panel points, with the effective loads at the end panel points correspondingly reduced. This effect was noticed by several nineteenth century writers on the theory of roof truss design and was often allowed for by them in their designs. Later such allowance was objected to on the grounds, firstly, that any deviation of the panel points from a straight line might materially modify the distribution of loading on the panel points, and, secondly, that the general downward flexure of the rafter would tend to reduce the effective loads on the central panel points by the beam action of the rafter as a whole. Reference to this effect had since tended to drop out of the literature of the subject. It was not considered that the reasons quoted above for the omission of this effect were in themselves adequate : a more potent factor was the partial fixity of the ends of the rafter, which might certainly result in a material reduction of the divergence of the effective loads from those ordinarily estimated. Values

for the effective panel point loads intermediate between those obtained by the "continuous" and "simple span" methods might therefore be expected to occur.

Symbols Employed :—

L = Length between adjacent panel points (considered uniform).
B_1 = Max. B.M. on rafter as calculated on assumptions of Fig. 1.
B_2 = Max. B.M. but on assumptions of Fig. 2 (as percentage of B_1).
B_3 = Max. B.M. but on assumptions of Fig. 3 (as percentage of B_1).

Types of Loading :—

I.—Loads (W) at ½L spacing, every second load being at panel point.
II.—Loads (W) at ⅓L spacing, every third load being at panel point.
III.—Loads (W) at ¼L spacing, every third load being at panel point.
IV.—Loads very closely spaced and treated as uniformly distributed and of total weight W over length L.

ANNUAL DINNER.

The Rt. Hon. Lord Carson, P.C., K.C., was the guest of honour at the annual dinner of this Institution, held on Monday at the Piccadilly Hotel, W., under the presidency of Mr. H. J. Deane, B.Eng., M.Inst.C.E. Among those present were Messrs. S. W. Ackroyd, A.R.I.B.A.; A. H. Adamson; Ewart S. Andrews, B.Sc., M.Inst.C.E.; W. J. E. Binnie; D. A. Bremner; S. Bylander; R. M. Carter; H. John Collins, M.C., M.Sc.; Brig.-General A. C. Critchley, C.M.G., D.S.O.; Messrs. Arthur Downer; F. E. Drury, M.Sc.; F. M. Du Plat Taylor, M.Inst.C.E.; A. H. Durnford, L.R.I.B.A; A. H. Dykes; G. F. Earle; Dr. W. H. Eccles, F.R.S.; Sir Henry Fowler, K.B.E.; H. T. Garvie, M.I.Mech.E.; Rev. F. H. Gillingham, Hon.A.I.Struct.E.; Mr. F. S. Griffiths, F.S.I.; Professor J. Husband, M.Eng., M.Inst.C.E.; Messrs. E. W. King; H. W. Langdon, F.S.I.; Capt. E. M. Leest, T.D., J.P.; Mr. Fred May; Major E. Miles; Sir Ernest Moir, Bart., M.Inst.C.E.; Lt.-Col. J. Mitchell Moncrieff, C.B.E., M.Inst. C.E.; Mr. Emile Mond, Hon.A.I.Struct.E.; Brig.-General Magnus Mowat, C.B.E.; Messrs. John Murray, F.R.I.B.A.; Frederick Palmer, C.I.E.; Sir Lindsay Parkinson; Major James Petrie, O.B.E.; W. T. Plume, Sir Frederick Gill Rice, M.P.; Messrs. J. T. Saunders, F.R.I.B.A.; R. A. B. Smith, A.M.Inst.C.E.; H. E. Steinberg, A.M.Inst.C.E.; P. Malcolm Stewart; Alfred J. Taylor, F.R.I.B.A.; J. H. Walker, M.Inst.C.E.; Major A. H. S. Waters, V.C., D.S.O., M.C., M.Inst.C.E.; Mr. Dendy Watney; and Capt. M. G. Kiddy, Secretary of the Institution.

The loyal toasts honoured, Major A. H. S. Waters, V.C., D.S.O., M.C., M.Inst.C.E., proposed the toast of "Our Country and Empire." He said that he—like the Company-Sergeant-Major—had only one qualification: he spoke the language. He would take heart from that fact. They were particularly happy to have with them Lord Carson. Only a few knew all the services that Lord Carson had rendered to the country. He would ask them to drink the toast of "Our Country and Empire," coupled with Lord Carson's name.

Lord Carson, in reply, said he felt grateful for the honour the Institution had done him in inviting him and his wife to be there that evening. He felt that all men were interested in construction. Even he himself, at school, was interested in Balbus—who was building a wall. His connection with structural engineering was even closer than that, for his father was an engineer, and, much against his father's advice, he went in for engineering training. He did so well that his father induced him to give it up for fear he should get to like the work! But he felt that if he had been allowed, he would have become the greatest structural engineer of them all! Construction was the one thing that gave pleasure in life. It was not necessary to construct great bridges and dams. He had spent his life in constructing cases. The only thing that could have added to the honour of replying to the toast was that Major Waters had proposed it. He thought the Empire was like a composite arch composed of separate stones, with His Majesty the King as the coping stone that completed that arch.

Sir Ernest Moir then proposed "Our Guests," saying that they had had a most interesting speech from Lord Carson. He thought that there was a similarity between civil engineering and law. Both professions looked to precedent before making their decisions in advance. In Mr. Palmer, they had a very fine example of the Civil Engineer. He would propose the toast, coupled with the name of Mr. Frederick Palmer.

Mr. Palmer, in reply, said the Institution of Civil Engineers had opposed the application of the Institution of Structural Engineers for a charter not because of any professional jealousy, but because they thought it was in the best interests of engineering that the measure should be opposed. They did not object to the Institution of Mechanical Engineers or the Institution of Electrical Engineers having charters, because the work of the members of those institutions was different from the work of civil engineers. But the proposal that the Institution of Structural Engineers should have a charter was in a different category, for if civil engineers were not structural engineers he did not know what were the duties of the members of the Institution of Civil Engineers. They opposed the measure because they wished to avoid any confusion in the use of the words "Chartered Engineer"; they did so with great reluctance and without any feeling of ill-will. The Royal Institute of British Architects was applying, in Parliament, to have the position of architects strengthened and made clear, and the Institution of Civil Engineers was opposing that measure also. The Institution felt that a great deal of the work of its members might come under the description of architectural work. He had personally been associated with the construction of buildings for railways and harbours, and he was quite sure that if that type of work were taken from engineers many of them would have to seek other careers. He would like to see more unity amongst engineers. There were several engineering institutions now in existence, and he was convinced that the sooner they got together and came under one flag the better it would be for engineers as a whole.

The Rev. F. H. Gillingham also responded to the toast.

Sir Henry Fowler then gave the toast of the "I.S.E. and its President," saying that Mr. Deane had taken a great interest in the formation of the Institution. The President, in acknowledging the toast, gave some account of the history of the Institution and said that in the course of the last year they had added over 1,000 members to their roll.

The President then vacated the chair and a musical programme followed.

Science Library, South Kensington.

The Director and Secretary of the Science Library, Science Museum, South Kensington, has intimated to the Council of the R.I.B.A. that facilities will be afforded to members of the Royal Institute, to whom the Board have authorised the issue of books and periodicals on loan to scientific workers, on condition that no charge for postage or for replacement of lost copies falls on the public funds. It will not be possible to send books and journals to individual workers direct, but they will be forwarded through the Library of the Royal Institute on guaranteeing the replacement of any book or periodical that may be lost or damaged. All requisitions for the loan of books by members of the Institute will be signed by the Librarian R.I.B.A.

LIABILITY UNDER A LEASE

A recent case, Horlick *v.* Scully (*Weekly Notes*, March 26), raised an interesting point as to the liability of a tenant for maintaining in proper condition ornamental lakes subject to the lease. In 1915 the plaintiff's predecessor in title had leased to the defendant for a term of 13½ years a mansion house and grounds, together with the sporting and fishing rights, under covenants which, *inter alia*, required the tenant to keep and leave "all pleasure grounds," lawns, walks, borders, shrubberies and carriage drive "in good and proper order and condition," and not to do or permit any spoil or damage whatsoever to the demised hereditaments. The pleasure grounds included two ponds and three lakes, the latter occupying an area of about 5½ acres. The main ground of complaint appears to have arisen in connection with the lakes and the trout in them. Evidence was given that when the lease was granted, although there was some mud in the lakes, they were in good and proper condition, but that two of the lakes had become silted up with mud so that there was not sufficient water to keep the fishing in good order and condition, for 2 ft. 6 in. of water over the mud was necessary for this purpose.

In the first place the Court held that the expression "all pleasure grounds" in the lease included the area of the lakes, although they were not specifically mentioned. It appears to have been argued for the defendant that the clearing out of the mud would be in the nature of structural repair for which the tenant would not be liable, and Bird *v.* Elwes (1868, L.R. Ex. 225), Lister *v.* Lane (1893, 2 Q.B. 212), and Dashwood *v.* Magniac (1891, 2 Ch. 306) were cited.

The Court did not accept the contention that this would be structural repair, and as regards the case Dashwood *v.* Magniac, where it had been held in the Court below (L.R. 18, Equ. 30) that a tenant for life who, under a will had to keep the mansion house and grounds in good repair, was under no obligation to clean out a lake, the Court distinguished this case, from the present case, as there was no evidence as to the condition in which the testator had left the lake, and the life tenant was only liable for income expenditure, and it was held it would be inequitable to compel her to undertake a capital expenditure.

The Court therefore held that the plaintiff was entitled to a declaration that under the covenants in the lease it was incumbent upon the defendant to keep and leave all the ornamental waters in good and proper order and condition, and then proceeded to consider what was meant by "proper order and condition" in connection with such a subject matter as this. As regards these lakes, it did not mean that the defendant must clean them out entirely, but that she must arrest any injurious element that rendered the lakes out of order, that is to say, mud must be removed in all parts where the presence of the mud reduced the depth of water to less than 2 ft. 6 in.

Dealing with the liability of the defendant on a monetary basis, the Court assessed the cost of removing the mud from that lake which was the worst of the three at £300; as regards the second lake, where the obstruction was only partial, the cost was to be estimated by surveyors and added to this sum. Damages were assessed at £20 in respect of the deterioration in the fishing. A claim as to the third lake had been given up by the plaintiff in the course of the trial, and a claim for failing to keep in good repair the stone and brick curbing round the lakes was characterised by the Court as a trivial matter, and no damages were awarded to this.

Westminster Bank, Ltd.

The Rt. Hon. Sir Alfred Moritz Mond, Bart., P.C., M.P., has been appointed a director of Westminster Bank, Ltd.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XVIII

By H. V. MILNES EMERSON, A.R.I.B.A.

SECTION 65: FURNACE CHIMNEY SHAFTS.

Unless the Council otherwise permit, every himney shaft for the furnace of a steam ngine brewery distillery or manufactory shall e constructed in conformity with the follow- ng rules :—

(1) Every shaft shall be carried up through- ut in brickwork and mortar of the best uality, and if detached shall taper gradually rom the base to the top of the shaft at the ate of at least 2½ in. in 10 ft. of height.

Note.—Lime mortar should be used for tached shafts, cement mortar can be used or shafts within a building. Enclosed shafts eed not be tapered.

(2) This sub-section specifies the thickness f brickwork to the shaft.

(3) Every cap, cornice, etc., shall be con- tructed and secured to the satisfaction of the District Surveyor.

(4) The foundation of the shaft shall always e made to the satisfaction of the District Surveyor on concrete or other sufficient foun- lation.

Note.—Sub-sections 3 and 4 relating to the onstruction and fixing of cap to shaft and he formation of the foundation is left solely o the discretion of the District Surveyor. Foundations for structures other than furnace himney shafts are subject to the by-laws of he L.C.C.

(6) The width of the base of the shaft, if quare, shall be at least one-tenth of the pro- osed height of the shaft or if the same is ound or any other shape then one-twelfth of he height.

(7) Any firebricks built inside the lower ortion of the shaft shall be provided as addi- ional to and independent of the thickness of rickwork prescribed by these rules and shall ot be bonded therewith.

Note.—Firebrick linings to shafts or flues hould not be bonded to the ordinary brick- ork owing to the uneven expansion and ontraction. Firebricks should be set in fire- lay. A shaft in a large London hotel was uilt as follows :—The shaft was within the uilding, square section. The walls were uilt without batter with the offsets inside. he firebrick lining was carried to the top f the shaft, being 9 in. thick for the first 0 ft. and 4½ in. thick for the remaining eight of about 100 ft. At intervals of 10 ft. his 4½ in. lining was carried on an iron frame upported on brackets from the outer wall. space of 2 in. was left between the top of ach section of the firebrick lining and the on base plate above to allow for expansion nd contraction of the brickwork, an iron late on the inside face covering the cavity nd preventing the smoke passing through. he space between the firebrick lining and he outer wall increased in area with the eight. The top was covered over and the pace was utilised as a ventilating shaft, air ucts entering at each floor level, the air eing extracted at the top of the shaft by eans of an electric blower aided by the heat assing up the internal shaft. This air space lso prevented the heat from the shaft pass- ng into the rooms adjoining same.

A steel internal shaft can be substituted for he firebrick shaft described above, if re- uired.

Section 66.—(1) The floor under every oven, opper, steam boiler or stove which is not eated by gas, and the floor around same, hall for a space of 18 in. be formed of mate- als of an incombustible and non-conducting ature not less than 6 in. thick.

Note.—Ordinary chimney openings are ealt with under Section 64. A special fee chargeable by the District Surveyor in espect to this and the following sub-sections.

(2) A pipe for conveying smoke or other roducts of combustion, heated air, steam or ot water, shall not be fixed against any uilding on the face adjoining to any street r public way.

(3) A pipe for conveying smoke or other products of combustion shall not be fixed nearer than 9 in. to any combustible materials.

(4) A pipe for conveying heated air or steam shall not be fixed nearer than 6 in. to any combustible materials.

(5) A pipe for conveying hot water shall not be placed nearer than 3 in. to any com- bustible material.

Provided that the restrictions imposed by this section with respect to the distance at which pipes for conveying hot water or steam may be placed from any combustible mate- rials shall not apply in the case of pipes for conveying hot water or steam at low pres- sure.

For the purposes of this section hot water or steam shall be deemed to be at low pres- sure when provided with a free blow off.

Note.—Although the foregoing restrictions do not apply to pipes conveying hot water or steam at low pressure, care should be taken that such pipes are covered with a non- conducting material when passing under wood floors, etc. Unprotected pipes in similar posi- tions have been the cause of fire.

Section 67.—Floors above furnaces and ovens.—The floor over any room or enclosed space in which a furnace is fixed and any floor within 18 in. from the crown of an oven shall be constructed of fire-resisting materials.

Note.—New floors would be constructed of concrete, etc. If an existing building is being equipped with an oven and the floor above same is of wood it can remain if it is 18 in. or more above the crown of the oven, but if within 18 in. the floor must be removed and constructed of fire-resisting materials in accordance with the London Building Acts (Am.) Act, 1905, First Schedule Sub-sec- tion 4 (a) In the case of floors and roofs, brick tile terra cotta or concrete . . . not less than 5 in. thick in combination with iron or steel.

Section 68.—Rules as to accesses and stairs in certain buildings.—In every public build- ing and in every other building of more than 125,000 ft. in cubical extent and which is constructed or adapted to be used as a dwell- ing-house for separate families, the floors of the lobbies, corridors, passages and landings and also the flights of stairs shall be of fire- resisting material and carried by supports of a fire-resisting material.

Note.—The floors would be as Sub-section 4 (a) of the 1905 Act, but the stairs can be in hardwood of 1¾ in. finished thickness as de- scribed in Sub-section 2 of the first schedule of the 1905 Act.

The rules for the construction of staircases and corridors of public buildings are given in Section 80 and will be dealt with later.

Section 69 (1).—In every building con- structed or adapted to be occupied in separate tenements by more than two families the prin- cipal staircase used by the several families in common shall be ventilated upon every storey above the ground storey by means of windows or skylights opening directly into the external air or shall be otherwise adequately ventil- lated.

(2) The principal staircase in every building being a dwelling-house and not subject to the provisions of Sub-section 1 of this section shall be ventilated by means of a window or skylight opening directly into the external air.

Note.—The size and position of window or skylight is not given. Although the window of a staircase has to be in an external wall, the staircase need not have an external wall provided the staircase well is connected at each storey to an external window with a ventilating trunk. The skylight need not be directly over the staircase well. Ventilation and not light is required by this section. In Sub-section 2 the method adopted in the present-day two-storied dwelling-house is to provide a hinged ceiling light over the stair- case (when not on an external wall) with a hinged skylight in the roof. Apart from lighting the staircase the skylight is practi- cally useless for the purpose of ventilation as it is very seldom opened.

Section 70.—Rules as to habitable rooms (1) (a) Every habitable room, except rooms wholly or partly in the roof, shall be in every part at least 8 ft. 6 in. in height from the floor to the ceiling.

Note.—The height is measured from floor to ceiling and not from top of floor joist to underside of ceiling joist. In the majority of the districts outside London the minimum height of rooms is 8 ft. Under the Met. Building Act, 1855 (repealed) the height of every habitable room in London had to be at least 7 ft. from floor to ceiling, and under modern conditions the height of 8 ft. 6 in. could be modified.

(b) Every habitable room wholly or partly in the roof of any building shall be at least 8 ft. in height from the floor to the ceiling throughout not less than one-half the area of such room.

(c) Every habitable room shall have one or more windows opening directly into the exter- nal air or into a conservatory with a total superficies clear of the sash frames free from any obstruction to the light equal to at least one-tenth of the floor area of the room and so constructed that a portion equal to one- twentieth of such floor area can be opened and the opening in each case shall extend to at least 7 ft. above the floor level, but a room having no external wall or a room con- structed wholly or partly in the roof may be lighted through the roof by a dormer window with a total superficies clear of the sash frames free from any obstruction to the light equal to at least one-twelfth of the floor area of the room and so constructed that a portion of such window equal to at least one-twenty- fourth of such floor area can be opened, and the opening in each case shall extend to at least 5 ft. above the floor level or such room may be lighted by a lantern light of which a portion equal to at least one-twentieth of the floor area can be opened.

Note.—Windows equal to one-tenth of the floor area must be provided to each habitable room, the height of such window from the floor to the underside of the frame must be not less than 7 ft. and one-half of the windows must open. Windows in excess of the mini- mum requirements can be fixed in any posi- tion and can be made fixed or to open. The window area of one-tenth of the floor space is the general rule throughout the country.

With regard to lighting habitable rooms in a roof, the London Building Acts Committee recommend "that bedrooms with top light only should be forbidden." Every w.c. must be provided with a window, so that at least 2 square feet in area shall be made to open directly into the external air.

Antiquities of Surrey.

The Surrey Archæological Society, at their annual meeting at Guildford recently, re- elected Lord Onslow as president. In pro- posing the adoption of the seventy-second annual report, Lord Onslow said, regarding the ancient British, pre-Roman camp at St. George's Hill, which is popularly known as "Cæsar's Camp," that the committee of the council, appointed to consider the whole question, and to conduct the necessary cor- respondence with the owner, had reported that the minimum of what it seemed should be preserved should be approximately the northern portion of the camp, from a property known as Deepcut on the east to a little below the meeting of the three roads on the western side. The owner was there- fore asked:—(1) The amount of land he would be willing to sell; (2) the price; (3) the restrictions on the user it was desired to insert in any trust. It had been pointed out that there was no suggestion of turning the land into a recreational playground, but the object of the Trust would be the preser- vation of an ancient monument. They were now awaiting a reply.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—Ed.

Rain-Excluding Devices.

Sir,—Arising out of the correspondence upon this subject, I would like to draw attention to the common practice in post-War work, of cutting down the sizes of window frames to a limit which makes it almost impossible to provide adequate throating grooves. The labour of making up a 4 in. by 3 in. frame is practically the same as that for a 3½ in. by 2½ in., while the cost of the material works out at about 3½d. per foot run against 2¾d., or an extra of about 1s. 3d. per ordinary three-light casement window. The additional efficiency is incalculable, and there is no doubt that many of the faulty windows we are called upon to pronounce judgment upon are in such a state owing to foolish cheese-paring more than to bad timber. There is no doubt that the example has been set by some of the M. of H. specifications for housing, and it is high time that architects renounced the habit. The views of some of your correspondents upon the subject would be instructive.

Watchman.

Pine Sawdust Packing.

[Reply to Readers, May 6.]

Sir,—There is no doubt that damp sawdust in a confined space is liable to spontaneous combustion, but I believe that the conditions in which such an occurrence might come about would have to be particularly favourable to the process. The sawdust would have to be thoroughly sodden in bulk, and the atmospheric conditions just so as to suit, and I should say that the chances of these conditions combining would be a hundred to one against. What I should be more afraid of would be the setting up of rot, if, as seems to be the case, the access of damp to the sawdust is at all likely. Many a case of rot under floors has been traced to the improper cleaning out of the underfloor and the leaving of shavings and sawdust to hold the damp and infect the timbers. I should suggest that instead of using sawdust packing, slag wool be used well sprayed with a strong solution of formalin. If the casing is moderately air-tight, the strength of this solution should remain for a long period, and would be an excellent preventive against vermin.

Cautious.

Polish for Choir Stalls.

[Reply to A. J. W., May 6.]

Sir,—One of the finest polished mahogany tables I have ever seen was the result of continual rubbing in and polishing with oil. It is a long process, but seems to me to be the right one for the case quoted, since oil has already been used. It is just a matter of rubbing well in and allowing to dry in, and repeating the process until a fine surface is produced. There is no hurrying it.

Lasting.

Specification Clause.

[Reply to Builders, May 13.]

Sir,—"Builders" do not state whether they have actually entered into the contract containing the terms given. If they have not yet done so, it would be well for them to leave the matter until such times as they can succeed in getting the clause removed, and the work comprised in the contract better defined so as to prevent difficulties arising. But if, as appears, they have already entered into the contract, very little is open to them but to comply with the architects' instructions. These, however, must be reasonable; and can only be given after a consideration of what was intended by the parties to the contract, and what the contract includes. As to this last, in a lump sum or entire contract, all work necessarily incident to the performance of the work undertaken is included; for instance, any necessary preparatory work, also such work or materials which, although not mentioned or described in the contract, are indispensably necessary to complete the work contracted for as a whole.

It is to be hoped that there is an arbitration clause included in the contract; as by that alone can "Builders" secure redress in the event of the architect being unreasonable in a decision as to whether certain work is inside the contract or not.

Law.

Asbestos Bungalow.

Sir,—How does a bungalow, the shell of which is composed of a timber framework with sheets of asbestos on the inner and outer sides, compare with a brick bungalow of similar size, in regard to (1) value; (2) durability; (3) resistance to changes in outside temperature?

The asbestos building has brick foundations Does the market value of an asbestos house depreciate rapidly on account of its character? Are there any special disadvantages in an asbestos house?

H. D.

Bending Moment

[Reply to W. B., May 13.]

Sir,—From the information provided it would appear that the ends of the beams in each given are more or less rigidly fixed, and consequently must be subjected to a bending moment of some magnitude greater than zero.

Two cases of case (*a*) can be readily solved: First, when the ends *rest* freely on the end supports, and the moments at the ends are then *zero;* secondly, when the ends are *rigidly fixed,* and the end moments are then $\frac{WL}{12}$ for a uniformly spread load, or $\frac{WL}{8}$ for a load *W* concentrated at mid-span. The end moments will differ from these amounts according to the amount of elastic yielding of the end supports. W. B. should consult Morley's Theory of Structures, chaps. VII, VIII, and XV, in which this subject is dealt with in some detail. If this matter is of sufficient general interest I would deal with this query at greater length.

G. J. W.

THE TRADES TRAINING SCHOOLS

The annual judging of the work done by the students of the Trades Training Schools, 153, Great Titchfield-street, W.1, during the past session, took place on Wednesday, the 11th inst. The judges were Mr. G. C. Barnes, Major Gerald F. Bird, Mr. Lewis W. Bristowe, Mr. J. H. Davies, Mr. E. Guy Dawber, A.R.A., P.R.I.B.A., Sir Harry Foster, M.P., Sir George Frampton, R.A., Mr. F. T. W. Goldsmith, F.R.I.B.A., Mr. W. Stewart-Greene, Mr. Alexander L. Howard, J.P., Major E. B. Hunter, M.I.E.E., Sir W. Goscombe John, R.A., Mr. R. J. Johns, Mr. Bertrand Johnson, C.C., Mr. Arthur Keen, V-P.R.I.B.A., Mr. S. Lovering, Sir Edwin L. Lutyens, R.A., F.R.I.B.A., Mr. C. J. Newson, Mr. George Parlby, Mr. W. T. Plume, Mr. E. S. Rider, Mr. Frank W. Robson, Mr. S. G. Castle Russell, M.I.E.E., Mr. H. D. Searles-Wood, F.R.I.B.A., Sir John W. Simpson, P-P.R.I.B.A., Mr. F. Adams Smith, F.R.I.B.A., Professor R. Elsey Smith, F.R.I.B.A., Sir Brumwell Thomas, F.R.I.B.A., Mr. T. W. Townend, Professor W. H. Wagstaff, M.A.

Mr. H. Westbury Preston, Master of the Worshipful Company of Carpenters, presided, and the Carpenters' Company were represented by Mr. Frederick Sutton, J.P. (chairman of the schools), Mr. Percy Preston, and Mr. J. Hutton Freeman, the clerk.

The classes of Carpenters, Joiners, Handrailers, Masons, Glaziers, Painters and Decorators, Plasterers, Plumbers, Metal Workers, Stone Carvers' Life Modelling, Tylers and Bricklayers, Wheelwrights, Woodcarvers, and Electricians produced a large amount of work which was most interesting, and showed in a comprehensive manner the value of the training provided at these schools under the directorship of Sir Banister Fletcher, F.S.A., V-P.R.I.B.A. Prizes and medals as awarded by the judges will be distributed at Carpenters' Hall, Throgmorton-avenue, in the early part of next session after the re-opening of the schools on September 19.

The Carpenters' Company, who maintain the schools in conjunction with the Associated City Companies of Armourers and Braziers, Glaziers, Joiners, Painter-Stainers, Pewterers, Plasterers, Tylers and Bricklayers, and Wheelwrights, are to be heartily congratulated on the excellent work of these schools. Information as to the classes and illustrations of the work carried out by students will be given in the annual report, which is published during the summer.

CENTRAL VALUATION COMMITTEE

The Central Valuation Committee (which was constituted under Section 57 of the Rating and Valuation Act, 1925, with the view of promoting national uniformity in valuation for local rates) held a meeting at the offices of the Ministry of Health on Friday, May 13. There was a large attendance of members, twenty-seven out of the total of thirty-two being present, under the chairmanship of Mr. Thomas White, J.P., of Liverpool.

The committee had a varied agenda before them, including a report on a number of miscellaneous matters by the executive committee. The committee came to decisions upon the following matters:—(*a*) whether, where the weekly or monthly rent is taken as the basis in arriving at the gross value, any deduction should be made from the sum calculated by multiplying that rent by 52 or 12, as the case may be; (*b*) the assessment of property depreciated in value owing to damage resulting from mining subsidence; (*c*) whether the gross value of "tied" farm cottages should be limited to the amount at which the value of occupying a cottage is reckoned as part-payment of wages in lieu of cash; (*d*) the separate assessment of land covered with water, where such land is comprised in a larger hereditament; (*e*) whether it would be proper to reduce or increase to the nearest pound a gross value which includes a fraction of a pound; (*f*) the valuation of glass houses which are "agricultural buildings" under the Act of 1925; (*g*) the effect of section 12 (9) of the Increase of Rent and Mortgage Interest (Restrictions) Act, 1920, in relation to the committee's previous resolutions; and (*h*) the general question of the relation of tithe rent charge to the gross value of farms.

The committee also adopted their annual report for the period ended March 31 of this year, and ordered the report to be submitted to the Minister of Health. The committee further authorised a letter to be addressed to county valuation committees and county borough councils inviting them to make contributions to the expenses of the committee in accordance with the scale previously fixed by the committee and approved by the Minister.

It will be recalled that the committee is composed of twenty-four persons appointed by the Association of Local Authorities, and of eight persons appointed by the Minister of Health. Of the latter number, seven are either members or officials of local authorities, so that out of a total of thirty-two members, thirty-one are either members or officials of the local authorities concerned with the valuation of property for local rates. The committee, in December last issued a first series of representations, which was circulated by the Minister of Health to the local authorities and received wide publicity. A second series of representations will shortly be made to the Minister of Health embodying the committee's decisions on the matters referred to above.

THE BUILDING TRADE

THE LAW OF FIXTURES.—IV.

By W. T. CRESWELL, Barrister-at-Law; L.R.I.B.A.; Associate (late Fellow) of the Surveyors' Institution; &c.

OWNERSHIP AND REMOVAL OF FIXTURES (2).

Relaxations to the Common Law Rule.

It has already been stated that questions as to the right to remove fixtures have in the past arisen from three different relationships of persons—(1) Between the heir or devisee and the executor of the absolute owner. (2) Between the remainderman and the executor of a tenant for life or in tail. (3) Between landlord and tenant. The rule that articles, when fixed, remain part of the freehold, has not been relaxed in the first case, and all the law leans in favour of the heir. In the second case there has been some relaxation in favour of the executor of the limited owner, and in the last case great relaxation in favour of the tenant. In the important case of *In re* De Falbe, Ward *v.* Taylor (1901), 1 Ch. 523, it was said that probably even at that date the relaxation was the same in each case, and was not confined to the relationship of a landlord and tenant, but extended equally to other cases also. Though an article may, technically, by being fixed to the freehold, thus lose for a time its chattel nature, yet by virtue of the exception or relaxation above referred to, as between limited owners and tenants, it is restored to its original condition and is a chattel and removable. In Leigh *v.* Taylor (1902), A.C. 157, Lord Halsbury, L.C., said: "It is all very well to say that there is a difference between the cases of an heir and an executor on the one hand, and a landlord and a tenant on the other; but if you grant the proposition that it must depend upon the purpose of the annexation, and you must attend to the degree of annexation, I am wholly unable to frame a hypothesis of a state of things in which these two principles will not decide the question, whether you are dealing with a landlord and tenant, or whether you are dealing with a tenant for life and a remainderman, or with people standing in any other relation to these things."

As to whether fixtures are intended to form part of the land; *In re* Hulse Beattie *v.* Hulse (1905), 1 Ch. 406, a tenant for life granted a lease for twenty-one years of a steam-mill and machinery, the lessee covenanting that at the end of the lease he would sell all the machinery then on the premises other than the demised machinery. On the expiration of the tenancy the tenant for life duly bought this machinery. He died, and his executrix claimed the machinery thus bought. It was held, in the absence of proof that the tenant for life intended to make a present to the remainderman, the machinery belonged to the tenant for life, and passed on his death to his executrix. Buckley, J., said: "The question is, not what is the nature of the attachment of the chattel to the soil, but what, having regard for all the facts of the case, must have been the *intention* of the tenant for life. . . . The question has been argued whether the true principle is that when the tenant fixes chattels to the freehold, with the right to remove them during his term, that right is an exception by which the chattels do not become part of the freehold. It appears to me that the exception is an exception to the maxim '*Quidquid plantatur solo soli cedit.*" It is not that the law allows the tenant for years to remove part of the freehold, but that the chattels have not become part of the freehold. The exception makes them not part of the freehold."

Between Mortgagor and Mortgagee.

The common law rule is rarely, if ever, relaxed between mortgagor and mortgagee, since articles affixed either before the mortgage or during the period of the mortgage pass to the mortgagee as part of his security. This, too, whether the mortgage is legal or equitable, and the property mortgaged is freehold or leasehold. Further, the right of a third party to remove articles which have been fixed during the term of the mortgage by the mortgagor giving that third party (under certain circumstances, for instance, a hire-purchase agreement) the right to remove them, must be exercised before the mortgagee takes possession.

In Lyon & Co. *v.* London City and Midland Bank (1903), 2 K.B. 135, chairs were hired from the plaintiffs for use in a hippodrome, by the owner and occupier of that building, under an agreement for hire containing an option of purchase which, however, was never exercised. It was held that the chairs did not cease to be chattels, although they were screwed to the floor, and that the property in them did not pass, as against the plaintiffs, to the mortgagee of the freehold under a mortgage of the building and fixtures. But in a case where the owner of the premises was also the owner of the chairs, and they were similarly fastened, they were held to be fixtures.

In Reynolds *v.* Ashley & Son, Ltd. (1904), A.C. 466, where machines had been supplied to the lessee of a factory on the hire-purchase system, and were affixed to the floor by bolts and nuts, and could have been removed without injury to the building or to the concrete bed in which the bolts were embedded, it was then held that the machines had been so affixed as to pass under a mortgage to the mortgagee. Here, the machines were regarded as improvements or additions to the land or buildings and as constituting a part of the mortgagee's security; so that nothing short of an express or implied agreement or express notice of the terms of the hire-purchase agreement made with the mortgagor whilst in possession would limit the mortgagee's rights to them as part of his security.

In *re* Cookes *v.* Morrison, Jones & Taylor, Ltd. (1914), 1 Ch. 50, under an agreement the plaintiff agreed to erect and complete a sprinkler installation for the protection of the defendant's premises from fire, the latter paying for it by instalments; the sprinkler to remain the property of the plaintiffs until the entire sum should have been paid. Subsequently, a receiver was appointed on behalf of the debenture-holders of the defendant company, and as they had not fully paid up the instalments, it was held that the plaintiff was entitled to enter upon the defendant company's premises and remove the installation, notwithstanding the appointment of the receiver. Thus enunciating the well-known rule of equity that where there are equal equities the law prevails.

In *re* Ross and Boal (1924), C.A. 1 I.R.129, an Irish case, the lessee's leasehold interest in certain premises had become subject to an equitable mortgage entered into with a bank by deposit of title deeds. Upon benches there were placed power-driven sewing-machines, which, however, were not fixed to the benches in any way, but were held in position by means of easily movable attachments. It was held that the sewing-machines did not pass as fixtures to the bank under the equitable mortgage.

Recent Legislation.

Under the Law of Property Act, 1925, the question of the removal of fixtures may still arise between an equitable tenant for life and the person entitled to the equitable remainder; and, in the case of the realisation of both freehold and leasehold mortgages, under a statutory power of sale and right to foreclose or take possession of the property, that power or right extends also to the absolute or other interest therein affected by the mortgage charge, and will include fixtures or chattels personal.

When Fixtures are Removed.

Fixtures which are removable by the tenant can only be removed during the term of the lease; and if he does not remove them during the term then they become the property of the landlord or reversioner; and any attempt of his to remove them after the term would constitute him a trespasser. In British Economical Lamp Co., Ltd., *v.* Empire, Mile End, Ltd. (1913), 29 T.L.R. 386, electric light filament lamps affixed to brackets, by the bayonet attachment in common use for the purpose, were, on the lessor's re-entering for non-payment of rent by the lessees, left on the premises. The lamps had been let to the lessees by the plaintiffs (the Lamp Co.), who at that time had made no demand for the lamps which undoubtedly were removable fixtures, but subsequently did claim them from the lessors, who refused to give them up. The plaintiffs therefore sued them in detinue (*i.e.*, for detention of the goods), and it was held that they were not entitled to recover.

Time in which to Remove Fixtures.

The right to remove fixtures extends throughout the term and over any additional period during which the tenant is entitled to consider himself as a tenant. This extension of time is not applicable where a notice to quit has been given and the tenant has nevertheless held over without the landlord's consent; but it would, of course, apply in the case of a Statutory Tenant holding over under the Rent Restriction Acts, 1920-1925. The position of that tenant, as to removal of fixtures, being the same as under the original tenancy.

A tenant holding over on an uncertain tenancy (*i.e.*, which is determinable without notice as in a lease for lives), or again, a tenant entitled under the stipulations of a lease to remove fixtures has either of them, a reasonable time after the end of the last life or after the expiry of such term in which to remove them.

Where there is a surrender of a lease, and a new lease is entered into with the same lessee who held the head lease, the new lease will include the tenant's fixtures as part of the demised premises; and if there is no stipulation in the lease, the effect of surrender and the granting of a new lease will be the forfeiture of any right the lessee had to remove the tenant's fixtures under the former lease; although, as previously stated, a tenant remaining in possession after the expiration of the term (if he can show that there is merely a prolongation of the term) is allowed to remove fixtures after the original term is ended. (See Leschallas *v.* Woolf, 1908, 1 Ch. 641.)

Izaak Walton's Cottage.

Izaak Walton's cottage at Shallowford, Staffordshire, has been destroyed by fire, but the contents of the building, which is now a museum, have been saved. The cottage, which is near the main railway line from Stoke to Stafford, is a half-timbered seventeenth-century building with a thatched roof, and forms part of the farm that Izaak Walton occupied in his later years, and which he bequeathed to the poor of the town of Stafford. It was restored three years ago at a cost of £570 and was opened as a museum in April, 1924. The trustees have decided to take steps to restore the premises to as far as possible their original condition, and to issue an appeal for funds. The main walls of the cottage and some of the principal timbers are still intact. The ancient fireplace, which was the chief feature of interest in the interior of the cottage, and was covered with a mass of debris, is to be carefully restored.

TEMPORARY TIMBER CONSTRUCTION, INCLUDING SHORING.—III.

BY G. A. GARDNER, M.I.Struct.E., Assoc.I.E.E., etc.

PART I of these articles gave general information regarding the basis of design for temporary timber structures, with special reference to the external forces, including the allowances for live loading, wind pressure, etc.; whereas Part II dealt principally with the internal resistances and gave values for safe working stresses. It now remains to consider in detail the component parts occurring in the generality of temporary structures, and to set down data for the design of the joints and connections.

Members acting as beams are usually proportioned to suit the safe flexural stresses; but the tendency to fail by horizontal shearing should be borne in mind, especially as shakes and checks caused by seasoning tend to initiate this type of failure. The effect of horizontal shear failure is to cause the beam to split along one or more longitudinal planes and hence subsequently to break across as several separate, shallow beams. Fig. 6 shows a por-

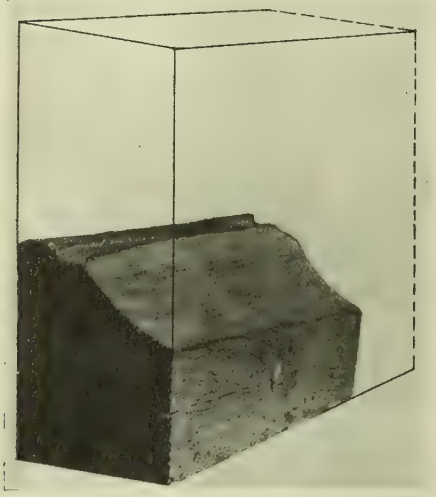

FIG. 6.

tion of a 2 in. by 7 in. fir beam which first failed in horizontal shear along two planes, on a span of 4 ft. 6 in. The fractured surface seen in the photograph is quite smooth and has followed an annual ring; and the first signs of failure occurred at an average shear stress of 275 lb. per sq. in.

The graph in Fig. 7 indicates how the intensity of horizontal shear varies with the propor-

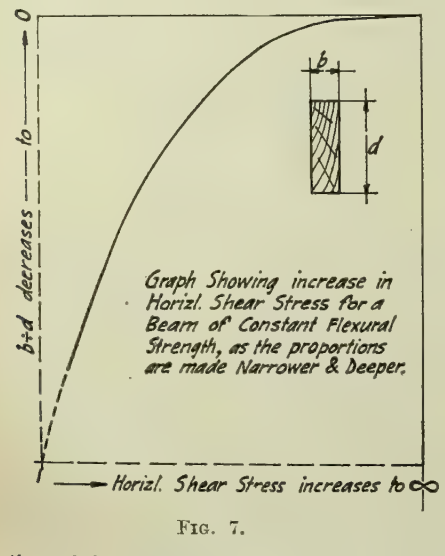

FIG. 7.

tions of the cross section in rectangular beams, and shows that it is in the narrower and deeper beams where this alternative tendency to failure must be considered. The simple straight-line formulæ for proportioning beams to suit the safe working stresses laid down for flexure and horizontal shear must be used with some degree of caution in cases where beams are notched out to a lesser depth at their bearings. Tests on beams so notched indicate a serious reduction in carrying capacity when the notch is approaching 20 per cent. of the depth, and this is to be expected not only on account of the reduced sectional area governing the intensity of vertical and horizontal shear, but by reason of the sudden change in stiffness of the beam at the shoulder. The effect of the lesser stiffness of the notched portion is to give rise to a secondary flexure which causes a splitting at the shoulder due to tension across the grain; and so marked is this effect that if the shoulders are cut away in a slow taper towards the centre of the beam the strength of the beam as a whole is *increased* by a considerable percentage. It is not suggested that notching at the supports must be prohibited (for the proper framing together of the parts of a temporary timber structure may be a matter of importance in some cases), but that an allowance should be made for the weakening effect. Experimental data in this connection are not sufficiently extensive to enable any precise rules to be formulated, but as a very rough guide the percentage reduction in the ultimate carrying capacity may be reckoned as one and a half times the percentage reduction in the depth of the beam at the bearings, for notches up to 33⅓ per cent.

Where timber beams are employed as needles or bressummers in important shoring schemes their deflection under load must be counteracted by some arrangement of wedges in order to prevent undue settlement of the work over; and this can usually be accomplished by pairs of folding wedges at the supports of the beams. The wedges must be long enough to allow tightening from time to time after the initial sag of the beam has been taken up, because the deflection of a timber beam is cumulative, due, among other things, to variations in the humidity of the atmosphere. The ultimate deflection under long-time loading, may be computed with sufficient accuracy by taking only 50 per cent. of the value of the modulus of elasticity or proportional deformation, E, as established by short-time laboratory experiments, in the general formulæ for deflection.* The approximate values of E for various kinds of timber may be taken as follows:—

Pitch Pine, Oregon Pine or Douglas Fir, 1,400,000 lb. per sq. in.; Oak, 1,200,000 lb. per sq. in.; Northern Pine, Baltic Fir, Red and Yellow Deal, 1,200,000 lb. per sq. in.; Spruce, White Deal, American White Pine, 1,000,000 lb. per sq. in.

Another matter to keep in mind is the sufficiency of a beam in bearing across the grain (*cf.* article ii); and this is likely to be a governing factor in short beams carrying heavy concentrated loads. The question of the adequacy of the bearing at the supports of a beam is important in gantry structures carrying rolling loads; and it is sometimes necessary to introduce a bolster of hard wood, such as oak, at the top of a post, for example, in order to increase the bearing area of the beam.

Rectangular beams may be required to function with their sections inclined at various angles to the plane of loading, and it must be borne in mind that the strength of the beam will depend upon two alternative conditions: (1) where the deflection of the beam is free to take place in a direction inclined to the plane of loading, conformable with the principles of elastic deformation; and (2) where the beam is constrained to deflect in the load-plane. The former condition would be approached if a load were freely slung from such a beam; and the latter if the load were communicated by othe beams providing lateral restraint. Formul for calculating the Resistance Moment beams obliquely loaded will be found in th standard text-books on Theory of Structur

Very few failures of timber beams unde working loads occur in practice, for the reaso that undue springiness and deflection a readily noticed and usually give rise to som timely remedial measure such as propping. Th writer, however, knows of two instances wher failure occurred, and of another case wher the drawings for an important timber structur bore the reference: "If undue deflectio noticed in this member, prop to be added"!

Much more uncertainty exists about th maximum carrying capacity of timber posts struts than about the strength of beams; espe cially in cases where the section of the strut built up of several timbers fastened togethe and where the proportions of the strut ar slender. The safe intensity of loading can nevertheless, be laid down for all practical pur poses; and the undermentioned formulæ an dictates for design may be accepted with con fidence.

Readers not familiar with the behaviour struts under test loading may be reminde that slender posts, *i.e.*, those of which th ratio $l \div d$ [(length) ÷ (least cross section dimension)] is in the region of 35 and over tend to fail by buckling rather than by direc tissue destruction; and that in the case a very slender strut, failure is signified by th elastic bowing of the member without th ultimate crushing (or flexural) resistance the timber being reached—the strut show under test in Fig. 8, for example, almost en tirely regained its original straightness afte

FIG 8.

being removed from the machine. In th case of carefully designed timber structures a permanent character the writer has per mitted struts with a ratio of slenderness a great as 60; but for the rougher constructio contemplated in temporary timber work value between 40 and 50 should be considere the limit, and this only in the case of strut whose end bearings are flat, *i.e.*, normal t and the full area of, the cross section of th member; whilst bracing struts with end bolted to the sides of the main timbers shoul be limited to a ratio of about 35.

Flat-ended posts or struts of rectangula section, with a length not greater than 1 times d may be loaded up to 7-10ths of th safe intensities of bearing pressure parallel t the grain, given in the table accompanyin the second article in this series; and fo similar struts with a greater ratio of slende

* See any elementary book on structural mechanics for deflection formulæ.

ess the following formula is applicable:—

$$p = b\ (1 - \frac{l}{50\,d})$$

n which p is the safe pressure in pounds er sq. inch; b is the appropriate bearing ressure parallel to the grain as given the above-mentioned table for the kind f timber in question; l is the length of ie strut in inches; and d its least cross- ctional dimension in inches. It is seen that e formula gives a result $p = o$ when the ratio slenderness is 50; and this tends to limit e useful range of struts to a little over 45 r the value $l \div d$.

In cases where the load is communicated the strut through bolted side connections llowance must be made in the above formula r the increased tendency of the more slender ruts to buckle, due to lack of the restraint hich the flat ends provide, and to the eakening effect of eccentricity of loading sulting from the uneven distribution of bear- ig pressure at the bolted joint. This allow- nce can be covered in the formula by taking n increased length for the strut, known as ie virtual length, lv, such that $lv = 1\frac{1}{2}l$. he value of p will then $= o$ when the actual atio of slenderness is 37.5; and this will limit he useful range to $l \div d =$ about 35, as before ientioned.

The formula is very simple to use, but for eady reference a table is appended to this rticle giving the safe intensities of loading er sq. inch for values of $l \div d$ from 15 to the pper limits.

Slender posts of circular section have ightly less rigidity than rectangular posts, nd an appropriate allowance has been made r this in the table by operating upon the rmula with a reducing factor, giving

$$p = b(1 - \frac{l}{45\,d}).$$

When slender posts or struts are built up f two or more separate timbers, bolted to- ether side by side to form the cross section, ie member as a whole will not develop the rength of a solid strut of the same propor- ons. This is due, among other things, to ie effect of the bolts being insufficient to revent altogether that comparatively minute exure of the several components of the mem- er which would take place were the com- onents acting as so many independent struts: nd failures have resulted in temporary timber ork due to this point being overlooked. The rength efficiency of such built-up members s compared with struts of solid cross ction will, of course, depend upon the rrangement of the component sticks and the ature of the bolting or other fastening; but r the cases such as usually occur in tem- orary timber construction, where, for ex- mple, three 3 in. by 9 in. firs are bolted side y side at intervals of several feet to form a in. by 9 in. post, the member as a whole hould not be credited with a carrying capacity uch in excess of the sum of the safe rengths of three component timbers calcu- ted as independent struts. This is especially ie case where the component timbers break int in the height of the post.

There is a difficulty in getting many un- miliar with the behaviour of struts under st, to appreciate this comparative deficiency carrying capacity, because they, having de- loped that rather uncertain faculty of judg- g the strength of members by perception, ceive the impression that the built-up strut *oks stronger*, if anything, than a solid post f similar proportions. At one time the riter carried out some tests on built-up ruts; and the photograph reproduced in ig. 9 shows the typical manner of failure by rippling of the component members,† lthough the struts as a whole were shallower a direction at right angles to the plane of uckling.

There is, of course, no serious objection to ie use of built-up struts provided they are roportioned according to appropriate criteria;

† As the rupture of the fibres can only be seen by elicate markings in the original photograph the repro- uction has been touched up to give a clearer indication.

Fig. 9.

and in the generality of cases which occur in temporary timber construction a sufficient margin of safety will be provided if the strut is calculated in accordance with principles already stated; treating each component of the cross section as an independent post credited with a carrying capacity 20 per cent. in excess of that given by the appropriate formula.

In the concluding part (IV) of these articles, bracing members; bolted and nailed joints, and considerations of structures as a whole, will be dealt with.

Table of Safe Intensities of Loading for Temporary Timber Struts, in lbs. per sq. in.

(To be concluded.)

Decorative and Industrial Art.

The second annual decorative and industrial art exhibition will take place from May 18 to May 28 (10 a.m. to 8 p.m. daily) in the Upper Hall of the Central Hall, Westminster. Viscount Burnham, president of the Faculty of Arts, will perform the opening ceremony at 11.30 a.m. on May 18. The exhibits will include works by a number of the vice-presidents; for example, panels in plaster by Mr. W. Reid Dick, poster designs by Mr. Norman Wilkinson, models of buildings by Sir Charles Allom, drawings by Mr. Oliver Bernard and Mr. John Hassall, and photographs and drawings of buildings by Mr. J. A. Gotch. Among the general exhibits will be leatherwork, decorative panels, woodwork, metalwork, pottery, hand-made glass, wood-carving, sculpture, porcelain, etching, bookbinding, printing, colour-prints, posters, hand-made silver ware, weaving, lace, and embroideries.

RENT RESTRICTION.

One of the most difficult sections to construe under the Rent Acts is section 2 of the Rent Act, 1923, and the difficulty is apparent on the face of it. Subsection (1) provides, "Where the landlord of a dwelling-house to which the principal Act applies is in possession of the whole of the dwelling-house at the passing of this Act or comes into possession of the whole of the dwelling-house at any time after the passing of this Act then from and after the passing of this Act or from and after the time when the landlord subsequently comes into possession, as the case may be, the principal Act shall cease to apply to the dwelling-house. Provided that where part of a dwelling-house to which the principal Act applies is lawfully sublet, and the part so sublet is also a dwelling-house to which the principal Act applies, the principal Act shall not cease to apply to the part so sublet by reason of the tenant being or coming into possession of that part, and, if the landlord is in or comes into possession of any part not so sublet, the principal Act shall cease to apply to that part notwithstanding that a sub-tenant continues in or retains possession of any other part by virtue of the principal Act."

In our issue for December 31st last we endeavoured to summarise the effect of the decided cases on this subsection, but a recent case, Cohen *v.* Gold (*Weekly Notes*, April 2, 1927), appears further to have complicated the interpretation to be placed upon it. In that case the plaintiff had, in 1913, acquired an unexpired term in a lease of a house and he had occupied the whole house with his family until 1925, when he let off the ground floor, consisting of three rooms to the defendant upon a weekly tenancy. The nature of the lease acquired by the plaintiff is not stated in the report of the case. The plaintiff brought this action to recover possession of the three rooms he had let to the defendant on the ground that the house was decontrolled under section 2, subsection (1), of the Act of 1923, and he relied upon the case Dunbar *v.* Smith (1926, 1 K.B. 360; *The Builder*, December 25, 1925). He contended that, being in possession as owner or landlord of the whole house when the Act of 1923 came into operation, the house had been taken out of operation of the principal Act.

From the short report available the decision of the Divisional Court is not easy to follow, but it appears that it was held that at the time when the plaintiff was in physical possession of the whole house the three rooms were not a separate dwelling-house and there was no landlord or tenant as regards them and that the Act did not apply to a case where possession at the material time was not possession of a dwelling-house let separately, or possession by a landlord, and therefore, as the plaintiff was not in possession of the separate dwelling-house formed by these three rooms at the material time, there was no possession of the whole of the dwelling-house at the passing of the Act.

As we have said, the decision as at present reported is difficult to follow, for it appears to wipe out the whole of the first part of the subsection, "Where the landlord of a dwelling-house to which the principal Act applies is in possession of the whole of the dwelling-house at the passing of the Act," unless on the principal of Catto *v.* Curry (1926, 1 K.B. 460; *The Builder*, March 12, 1926), the plaintiff here was treated as a mesne tenant under the proviso, but the proviso to the section and the cases decided thereupon appear to contemplate part of the house being sublet at the time possession is acquired of the house and not to refer to the first part of the section relating to the whole house.

This case appears to raise a most important point. We have always understood that the intention of this section was to secure the gradual decontrol of houses and that where a person in the position of an owner or landlord "is in possession" (for the words used in the Act are not only "comes into possession"), that house is decontrolled and Rent Restriction ceases to apply to it, but the above decision seems to imply that if a landlord who has been either in possession at the passing of the Act of 1923 or who has subsequently come into possession, then sublets part of his house, Rent Restriction is revived.

AMERICAN COST-SAVING METHODS IN BUILDING

By A. W. B.

I have recently returned from an extensive tour of the United States and Canada, and among the places which I visited were the following: New York; Chicago; Philadelphia; Pittsburg; Baltimore; Lancaster, Pa.; Washington; several important cities in Connecticut; and Toronto, Canada. In my opinion perhaps the most remarkable evidence of American progress in the skilled and technical professions is furnished by the various trades associated with the building industry in that country. The advancement made in methods of construction; the extent to which machinery is successfully used to shorten the time necessary for carrying out the work and keeping the cost low; the improvements made in planning, coupled with the labour-saving devices that are so extensively employed, and by means of which the occupants of the finished building have so many valuable advantages placed at their disposal, all provide evidence of change, improvement, and advancement, for which even the motor-car industry cannot furnish a parallel.

Americans do not rush in carrying out their various tasks, as we British generally think they do; in fact, my observations satisfied me that they rush even less than we do; but they are fully aware of the enormous value of method, and they are masters of its employment to the fullest extent possible. There is more method, and consequently less waste: in other words, the hours of labour in America, are utilised in a manner which enables the maximum output to be obtained without putting any undue strain upon the workers.

The three main factors which I think are responsible for the advancement and success of the American building industry are:—

(1) A free, open, and friendly understanding between the employer and the employed.

(2) Better co-ordination; all trades working together to secure progress without hindrance.

(3) The extensive employment of all kinds of labour-saving machinery—"labour-saving" is a misleading term; the proper term to use would be labour-aiding machinery.

1. In spite of well-organised and powerful trade unions on the one hand, and a considerable number of "open shops" on the other, there is comparatively little friction, and that masters and men get on very well together; this may be due, in a large measure, to the American educational system, under which every intelligent child may pass through the elementary schools, and proceed directly to the high schools. American boys and girls who have successfully passed through the elementary schools are given free education in the high or secondary schools, a fact which accounts for the more extensive knowledge of economics and of the principles that govern modern business operations, that is possessed by the ordinary American citizen. Masters and men, having both received similar advantages in education, are generally able to survey matters connected with industry and business from the same standpoint. The educational factor may also account for the spirit of comradeship that is such a noticeable feature in American industry; this comradeship exercising a beneficial influence over all classes, from the employer to the unskilled labourer.

2. America is pre-eminently the land of the sub-contractor; and unless there existed a high degree of co-ordination, the extraordinary rapid progress made in the construction of huge buildings would be impossible. Chicago is nearly one thousand miles distant from New York, but in both cities, and in other cities and towns also, I found, when looking over buildings in course of construction, that the various responsible men, and foremen, were keenly alive to the fact that it was greatly to the advantage of all concerned, that all should work together to secure unimpeded progress. In America the general foreman acts in a manner which may fittingly be compared with that of the conductor of an orchestra, in that he makes it his business to get all units to work together so that the desired result may be achieved.

It is to be regretted that the desire to work together does not exist to the same extent between the various sections of the building industry in this country. During the years that I have been connected with the trade, I have known cases where the general foreman has misdirected his energies to the extent of making matters unpleasant and difficult for the sub-contractor. I recall one particular instance in connection with a large building in the City of London, where, due to the

Jewellers' Building, Chicago.

fact that the general foreman would not interest himself in giving the exact floor levels, a sub-contractor found considerable difficulty in installing his appliances and fittings when the floors were completed. In another instance, the sub-contractor had to appeal to the architect before the general foreman would furnish him with the correct levels and other necessary particulars. In America such troubles are non-existent; as soon as the steel framework of a building is erected, the general foreman instructs one of his subordinates to put permanent marks thereon, by means of which anyone can ascertain the level of the finished floor; when the carcase walls are built, the marks are then supplemented by a level line struck along the inner side of the wall, this line being carried all round the building, and eventually all round each room and passage. The level line is usually placed at a height of three feet above the level of the finished floor, so that when anyone wishes to know the exact position of the finished floor, all that is necessary is to measure down the correct distance from the line given on the steelwork or on the wall. A similar system is in vogue in France and in other Continental countries, the line there being placed one metre above the finished floor level. Happily there is now gratifying evidence of better co-ordination in the building industry in this country, although we can still learn much from America in the matter of working together. Co-ordination means a reduction in the cost of production, without a reduction in the excellence of the finished product, the result being an increase of business, and a prosperous industry.

3. The extent to which machinery is used in the building trade in America is scarcely realised in this country. On a corner site having considerably less area than that upon which the London Mansion House stands, I saw two steam shovels at work tearing down basement walls, and later on excavating to a greater depth for the new building; these compact yet powerful machines have a bracketed shovel arm which makes it possible to operate them in a very restricted area. I asked one of the drivers if he could tell me the most confined area within which it was possible to employ such steam shovels; he answered, "If I have a clear space twenty feet square I can work it easily." The shovels travel on "caterpillars," and, in the early hours of the morning, I saw one travelling through the city under its own steam; on another occasion, when the traffic was at its height, I saw one being conveyed along Fifth Avenue on a low, specially constructed, motor lorry. The work accomplished by these compact machines is tremendous; during a conversation with a general foreman, I asked, "How do they compare with hand labour—the pick and the shovel, sledge and wedge?" "Compare with hand labour!" he exclaimed, "surely you don't think that hand labour can be compared with such appliances; there is no comparison between hand labour and the steam shovel!"

Another instance of the extensive use of machinery that came to my notice was in connection with the erection of the steelwork for a new hotel that has about the same ground area as that upon which the Carlton Hotel in London stands; four huge derricks were erected for the purpose, and the steelwork up to the seventh floor was completed within a fortnight.

When the carcase of a building is finished, electricity generally furnishes the motive power necessary to drive the machinery brought into use by the various trades. As the result of inquiries, I found that an abundant stock of spare parts is always kept on hand. The Americans do not attempt to patch up old machinery; in fact, old machinery is practically unknown—one type being discarded as soon as a more efficient type is placed on the market. If a part of any machine or appliance breaks, it is replaced by a new part; and unless there is unquestionable evidence of wanton carelessness, no questions are asked of the workman when a part breaks down; a new part is inserted and the work again proceeds. The foreman in charge of a central heating job whom I questioned concerning the cutting of threads on the ends of the pipes, showed me a stack of three dozen new dies, of various sizes, ready to insert in the stocks, and informed me that as many as eight new dies had been used in a single stock in one day, a statement which subsequent conversation with the workmen proved to be quite correct.

The American workman has no misgivings concerning the use of machinery; he is satisfied that its use is beneficial, and that it is greatly to his advantage to employ it to the fullest extent possible. Machinery enables the workman to produce easily, speedily, and at a low cost; and, due to there being an enormously increased demand for the output, the

mployment of machinery means an increased emand for labour, and consequently less nemployment. America knows that it is a allacy to regard machinery as an enemy of abour.

No better evidence of the wonderful results hat may be achieved by the employment of orethought, method, co-ordination, machinery, nd intelligent labour, could be given than hat which is furnished by the erection of the ew Jewellers' Building at the head of Vacker Drive, Chicago. This imposing struc- ure is forty stories high, the main building onsisting of twenty-three stories, the remain- g seventeen stories comprising the so-called ower, which itself forms a capacious build- g, covering considerable area. The total eight from pavement level to the top of the ome is 550 ft. The ground area covered is ot extensive, yet there are over twelve acres business floor space in the building, and ere is a multi-story garage extending the hole of the 23 stories of the main building, hich provides accommodation for 572 motor- rs; this storage is necessary because so any people in America—the employee as ell as the employer—own their own motor- r. In American cities it is not an unusual ght to see young lady typists who go to d from their daily employment in their own all car. Below the street level are the ime rooms, extending under which are the iler rooms and the necessary storage for el; then, lower still, is the low-level sub- sement.

The demolition of the old buildings occupy- g the site was started in May, 1925. The st steel stanchion was erected on October 9 llowing, and the last section completing the eelwork of the dome was placed in position February 15, 1926. From foundations to me, the average amount of steelwork ected and completed per day was close upon e hundred tons; that amount being con- derably exceeded daily when erecting the el which forms the framework of the stories which extend to the base of the wer.

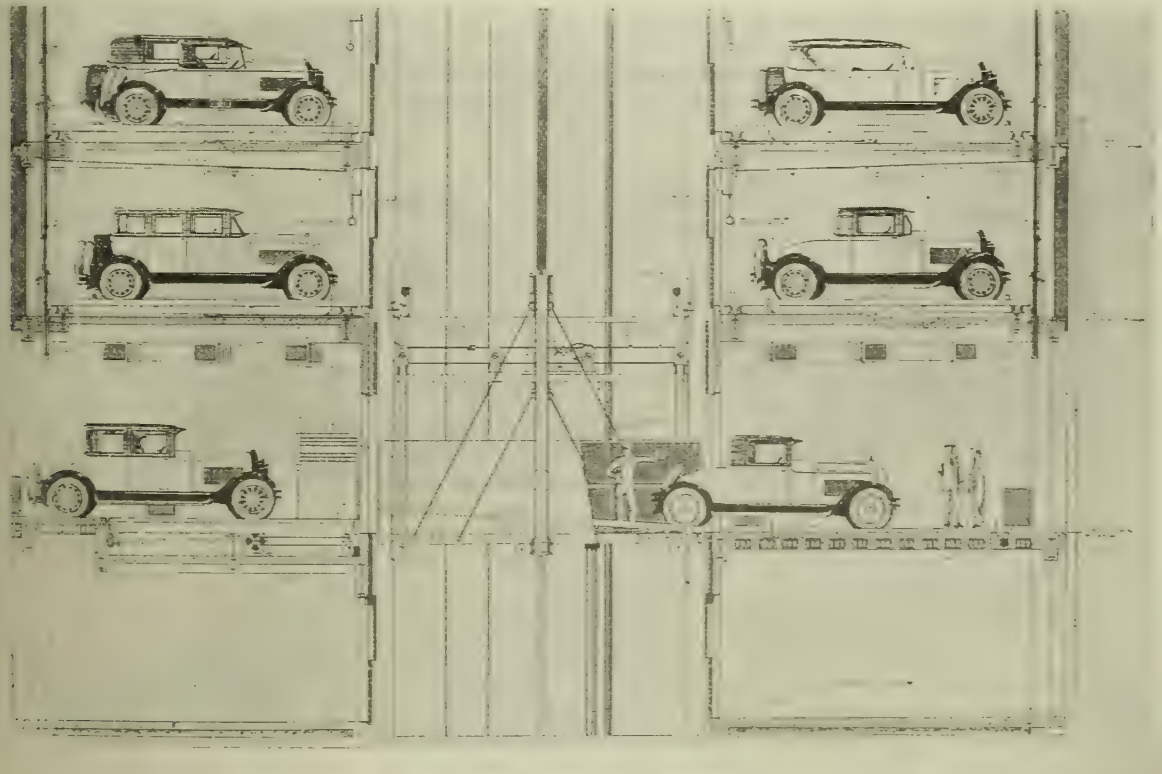
The masonry of the main building, and at of the first story of the tower—24 stories all—was all completed by February, 1926, d in May—only three months later—the ain building, from sub-basement to the base of the tower, was all ready for occupation. There are ten high-speed lifts, and one supplementary lift, in the main building; also two high speed lifts in the tower.

From the Records of the United States Weather Bureau we learn that the lowest winter temperature in Chicago is 23 degrees below zero; such a low temperature is unusual, but a temperature of 10 degrees below zero, which means 42 degrees of frost, may be experienced on a number of occasions during the winter months; this very low temperature would, of course, prevent any plasterers' work being carried out, or any other work that called for the use of cement or mortar, unless special means were adopted to combat the extreme cold. In the construction of the Jewellers' Building forethought, organisation, and co-ordination enabled the builders to keep the frost at bay.

As soon as the lower steelwork was in position, the boilers were installed; then, as the above-ground steelwork was erected, the steam heating mains were carried up in their permanent positions by the side of the stanchions; next followed the concrete floors, and the outer walls of brick-lined terra cotta. The radiators were then placed in position temporarily, and the building was heated to a temperature of about 55 degrees Fahr., which enabled all trades to proceed with their work in spite of an occasional 40 degrees of frost outside. No scaffolding was used for building the outside walls; but a number of long cradles, their ends touching, were hung by light steel cables from the higher steelwork. The men working in the cradles raise them by means of a winding arrangement, whenever they wish to work at a higher level.

A short description of the mechanical installation by means of which the motor-cars are placed in the garages on the various floors will be of interest.

A car is driven to the loading platform in front of one of the four special lifts; the owner then receives an identification disc, and the operator in charge removes a key from the master control, the key corresponding to the separate location in which it is intended to store the car. Without any further handling whatever, the car is run into the lift, taken up to the proper floor, and conveyed on a slide or floor traveller, to a fire- and thief-proof location that corresponds with the number stamped on the disc given to the owner. When the owner wishes to get the car out of the garage, he gives up the disc, and the operator again inserts the key in the master-control, and mechanism is brought into operation which, in about one minute, places the car at the owner's disposal. In front of the loading platform special means exist for the almost instantaneous removal of the exhaust fumes from the engine of the car; and the air in this part of the building is changed completely every two minutes.



The Jewellers' Building is a monument to united, organised effort. The American workman does not rush, but he keeps continuously at his work, without continuous supervision. Moreover, he is keenly alive to the value of concerted action, the result being that all trades work well together, and excellent results are achieved. Certainly there is much that we may learn from America in connection with the matters just mentioned.

New Discovery of Diatomaceous Earth.

Dominion Government engineers, who were boring in the bed of the Fraser River, near Quesnelle, in British Columbia, have, it is reported, struck a large stratum of diatomaceous earth, which is to be developed by a local company commercially. This infusorial earth is used to form steam-pipe casings, bricks, tiles, etc., on account of its relative lightness and its impermeability to atmospheric change.

Centenary of William Blake.

In connection with the centenary of William Blake (1757-1827) and the Exhibition now being held at the Burlington Fine Arts Club, twenty drawings in water-colour or pencil by Blake in the collections of the Victoria and Albert Museum have just been placed on exhibition near the main entrance of the Museum. Among them are four important water-colour drawings from the Circulation Department of the Museum which have not hitherto been accessible to students in London. A copy of "The Book of Job," and other examples of Blake's work as an engraver on metal and wood, are also on view.

Jewellers' Building, Chicago.

[Section showing method by which cars are shifted into position and moved from storage rack to elevator and vice-versa.]

NEW BUILDINGS IN LONDON

Acton.—TECHNICAL INSTITUTE. — Messrs. Leslie and Co., Ltd., of Kensington, are the general contractors for this technical institute and trade school to be erected in Acton for the Middlesex Education Committee. The architect is Mr. H. G Crothall, F.R.I.B.A., architect to the Middlesex County Council.

Addiscombe.—CINEMA.—Messrs. W. L. Griffiths and H. V. Milnes Emerson, A.R.I.B.A., 14, Coleman-street, E.C.2, have prepared plans for a cinema at Addiscombe to accommodate 1,200 persons. The Ashford Builders Co., Ltd., 36, Bloomsbury-square, W.C.1, are the general contractors.

Aldgate.—REBUILDING. — The "Golden Lion" public-house, Cannon Street-road, E., is being rebuilt by Messrs. T. Stevens, Ltd., for the brewers, Messrs. Taylor, Walker and Co., Ltd. The constructional steelwork is being supplied by Messrs. Young and Co., of 6, Queen Anne's Gate, Westminster, S.W.1.

Bexley.—NURSES' HOME.—The L.C.C. have sanctioned the expenditure of £20,175 for the provision and equipment of a nurses' home at Bexley mental hospital. Plans have been prepared for a detached nurses' home of three stories to house 67 women nurses.

Croydon.—SUB-STATION.—The Electricity Committee has received the sanction of the Electricity Commissioners to a loan of £630 for the purchase of a site for a sub-station at rear of 174, High-street. Plans are being prepared by the Electrical Engineer, Mr. A. C. Cramb, M.I.E.E.

Harlington.—ELEMENTARY SCHOOL. — An elementary school is to be erected in New-road, Harlington, for the Middlesex County Council. Their architect, Mr. H. G. Crothall, F.R.I.B.A., is preparing the plans.

Harrow Weald.—SECONDARY SCHOOL.—A site for a secondary school has been acquired at Brook's-hill, Harrow Weald, by the Middlesex County Council. Their architect, Mr. H. G. Crothall, F.R.I.B.A., is to prepare the plans.

Lamb's Conduit-street.—BOYS' CLUB.—The Harpur Trust, which governs Bedford School and owns an estate in Holborn, London, has passed a scheme for building at a cost of £7,000 new premises for the Holborn Boys' Club. The new headquarters of the club will be in Lamb's Conduit-street.

North Finchley.—TELEPHONE EXCHANGE.—The H.M. Office of Works is proposing to erect a branch post-office and telephone exchange at North Finchley.

Paddington.—WHARF BUILDINGS. — The B.C. is proposing the demolition of existing buildings and the erection of new buildings and stables on Nos. 11 and 12 Wharves, Northside, Paddington Basin. The architect is Mr. B. Cooper, P.A.S.I., L.R.I.B.A., the Borough Engineer and Surveyor. Tenders are now being invited.

Poplar.—NURSES' HOME.—The Board of Guardians propose to erect a new nurses' home and mortuary at St. Andrew's Hospital, Levon's-road, Bow, E.3. Plans have been prepared by the Borough Architect, Mr. Harley Heckford, M.Inst.C.E., Council Offices, High-street, Poplar, and tenders are now being invited.

Regent's Park.—BUILDING.—H.R.H. Princess Mary is to lay the foundation stone on June 9 of the new and final wing to the Bedford College for Women, Regent's Park. Mr. O. Maxwell Ayrton, F.R.I.B.A., 3, Verulam-buildings, Gray's Inn, W.C., is the architect.

St. Giles', W.C.—PREMISES. — Messrs. Nicholas and Dixon-Spain have prepared plans for premises to be erected on a site at 48, High-street, St. Giles', W.C.

Stamford Hill.—SYNAGOGUE.—Mr. G. Coles, F.R.I.B.A., of 40, Craven-street, W.C.2, has prepared plans for a new synagogue upon the eastern side of Margaret-street, Stamford Hill, N., for the committee.

PATENTS.

APPLICATIONS PUBLISHED.*

262,033.—W. A. Cloud: Grinding mills.
262,171.—S. A. Bennett: Roads.
262,189.—H. Schafer: Linings for mines and tunnels.
262,195.—J. E. Evans-Jackson (G. H. Whittle): Plaster.
262,224.—F. Mulligan: Bricks.
262,231.—G. Schlesinger: Method of producing cylindrical formations or hollow bodies from veneer or thin sheet wood and apparatus for use in connection therewith.
262,232.—J. H. Ditter: Mortar.
262,252.—Ransomes & Rapier, Ltd., and P. D. Ionides: Charging concrete.
262,267.—R. Hickton and R. G. Hickton: Bricks.
262,280.—D. G. F. Drummond: Device for heating water systems, circulating or otherwise.
262,284.—J. Dougall & Sons, Ltd., and W. B. Mitchell: Fireplaces.
262,293.—T. Robinson & Son, Ltd., and C. J. Robinson: Wood planing, moulding and like machines.
262,313.—D. M. R. McGubbin: Cement or solution and methods of using the same.
262,315.—H. Schuster: Floorings.
262,322.—W. Savage and Ruston & Hornsby, Ltd.: Excavating machines.
251,621.—P. Allaire: Reinforced concrete.
262,490.—W. E. Roberts: Construction of fireplaces, chimney-breasts and chimneys.
262,501.—W. Savage, F. H. Livens and Ruston & Hornsby, Ltd.: Excavating machines.
262,512.—Airship Guarantee Co., Ltd., and B. N. Wallis: Riveting of metal girders.
262,525.—Vickers, Ltd., and L. D. Parker: Rotary kilns for burning cement.
262,536.—W. Quick, S. E. Thomas and F. W. Berwick: Devices for controlling windows.
262,548.—J. & F. Howard, Ltd., and L. W. Jones: Road-making machines.
262,610.—W. Keeble: Sheet-metal frames or doors.
262,612.—Coalbrookdale Co., Ltd., and W. J. Jones: Domestic fire-grates.
262,647.—J. S. Withers: Blocks for building purposes.
262,658.—R. M. Cutts: Devices for modifying the recoil of firearms.
262,663.—G. F. Pittar: Metal sash frames and window frames.
262,676.—W. C. Kohler: Metal-sheet piling.
262,678.—Dressler Tunnel Ovens, Ltd., and O. Vermorcken: Tunnel ovens.
258,892.—V. Sigetter: Wall plugs.
243,308.—E. I. Lindman: Porus concrete.
262,848.—B. R. Allfree and P. J. Moore: Roads.
262,861.—J. E. Pollak (Miller Co.): Lighting fixtures.
262,891.—Metallic Wallplugs Ltd., R. P. Myers, and H. C. Meikle: Wall plugs.
262,932.—F. Sykes and J. Claughton: Domestic table.
262,940.—G. A. Hammond and A. Wood: Grates.
262,946.—W. L. Cole: Sawing machines.
262,952.—H. Russell and W. J. Russell: Fencing.
262,982.—G. Jaeger: Concrete-mixing machines.
262,983.—B. J. B. Corrie: Fencing.
263,039.—Stourbridge Glazed Brick & Fire Clay Co., Ltd., and F. H. Clark: Fire-place surrounds.
263,040.—J. H. Bennett: Stairs.
263,045.—A. J. H. Haddan (Moffats, Ltd.).—Cooking ranges.
263,065.—F. W. Miles: Roofing.
263,030.—W. G. Case: Domestic stoves.
263,205.—F. G. Garrett: Door hinges.
263,219.—A. B. Williams: Lavatory-basin.
263,254.—Jackson Electric Stove Co., Ltd., and F. Smith: Electric cooking-stoves.
263,257.—J. F. H. Crisp: Concrete walls and buildings.

* All these applications are now in the stage in which opposition to the grant of patents upon them may be made.

NEW COMPANIES

THE particulars quoted below have bee compiled by Messrs. Jordan & Sons, Ltc Company Registration Agents, of 116 & 11 Chancery-lane, W.C.2, from the documen available at the Companies' Registry.

JONES & CO. (CONTRACTORS), LTD. (220,722 Registered March 28. 8, Dumfries-place, Ca diff. Builders and Contractors, &c. Nomin capital, £500.

C. SIMMONS & CO. (220 716). Register March 28. Estate agent, builder and proper dealer. Nominal capital, £100,000.

HORTREES BUILDING CO., LTD. (220,687 Registered March 26. Builders and contractor &c. Nominal capital, £1,000.

ALBANY BUILDING CO., LTD. (219,844 Registered February 23. Albany-road, Coventr Nominal capital, £2,500.

KENT BUILDERS' SUPPLY CO., LTD. (219,860 Registered February 23. Builders' merchant manufacturers of and dealers in slates and tile &c. Nominal capital, £1,000.

R. P. DAVIS & CO., LTD. (219,867). Regis tered February 23. Builders and contractor for the erection, decoration and repair of house and dwellings, &c. Nominal capital, £15,000.

CANTERBURY GOLF CLUB, LTD. (219,848 Registered February 23. To provide golf link a club house, and other conveniences.

CONWOOD SUPPLY CO., LTD. (219,913 Registered February 25. Builders and genera merchants. Nominal capital, £1,000.

BIRCHALL BROS., LTD. (219,909). Registere February 25. Darlington-street, Middlewich Builders and contractors. Nominal capita £6,000.

LUNDWOOD DEVELOPMENT CO., LTD (219,894). Registered Febuary 24. Manufac ture bricks and tiles, &c. Nominal capital £7,000.

BILHAM & KILNEY, LTD. (220,124). Regis tered March 7. 68, Aldersgate-street, E.C. 1 Builders, decorators and sanitary engineers, &c Nominal capital, £500.

VALK ROOFING TILES, LTD. (220,103) Registered March 5. 16, St. Helen's-place E.C. 3. Manufacturers of and dealers in tiles bricks and slates, &c. Nominal capital, £1,000

W. J. DAWSON & CO., LTD. (220,104) Registered March 5. General merchants, con tractors, manufacturers and engineers, &c Nominal capital, £500.

TORQUAY BUILDING CO., LTD. (220,074) Registered March 4. Lower Union-lane Torquay, Devon. Builders and house decorators &c. Nominal capital, £3,000.

ROOKHOPE GANISTER, LTD. (220,100). Regis tered March 5. Quarry masters and stone and lime merchants, &c. Nominal capital, £1,500

H. ROPER, LTD. (221,319). Registered April 19. Weetworth-avenue, Leeds-road Glasshoughton. Builder. Nominal capital £5,000.

J. J. HODGSON & SONS, LTD. (221,240). Registered April 14. Builders and contrac tors. Nominal capital, £5,000.

ADAMS BROS. & BROADBRIDGE, LTD. (221,218). Registered 11 and 12. Trafalgar street, Brighton. April 14. Builders. Nominal capital, £2,000.

C. GROVES, LTD. (221,225). Registered April 14. Builders, general and public works contractors, &c. Nominal capital, £5,000.

SHREWSBURY BUILDING CONTRACTORS, LTD. (221,303). Registered April 19. Building contractor. Nominal capital, £1,000.

A. HONE & SONS, LTD. (221,290). Regis tered April 19. 195, Malpas-road, Brockley, S.E.4. Brickmakers. Nominal capital, £3,500.

E. SPARGO, LTD. (221,317). Registered April 19. Granite merchant, &c. Nominal capital, £3,000.

E. & D. CONSTRUCTION CO., LTD. (221,107). Registered April 9. Spital Cross, Eden bridge, Kent. Builders and contractors, &c. Nominal capital, £1,000.

RIVER SAND AND GRAVEL CO., LTD. (220,726). Registered March 28. 3, Cable street, Liverpool. Nominal capital, £2,000.

(For rates of wages in the Building Trade in Scotland, see page 834.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c. may be obtained

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, ETC.

MAY 23.—**Belfast.**—PAINTING.—Painting Belfast passenger station, for the Great Northern Railway Co. Engineers' offices, Dublin or Belfast. Dep. £1 1s.

Crematorium for Ipswich.

Plans for the erection of a new Cemetery Chapel at Ipswich, in which a Crematorium will be incorporated, have been approved by the Burial Board. Mr. J. A. Sherman, of Ipswich, is the architect. The scheme is estimated to cost £6,000.

PROPOSED NEW BUILDINGS & OTHER WORKS*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

ACCRINGTON.—The Committee considered and approved the following building plans: 2 houses in Whalley-road, for Houldsworth and Spencer; laundry, 105, Manchester-road, for H. Howarth; bungalow in Scott-street, Baxenden, for E. S. Ware.

BELFAST.—The following plans have been approved by the City Surveyor: villa in new street off Kensington-av., for J. Brown; architect, W. C. Maxwell; villa in Brookhill-pk., for A. McDowell; architect, T. Houston; 6 houses on Broadway, for T. L. Cole; additions to factory premises on Crumlin-rd., for W. Ewart & Sons; builders, McLaughlin & Harvey; 17 garages in Adelaide-av., for Cairns Bros.; architect, D. W. Boyd; alterations to premises on Old Lodge-rd., for J. Kingsmore; architect, J. McAlery; 6 villas in Thirlmere-gdns., for Thompson McCullough, builder; clubhouse in Ashfield-gdns., for the Jewish Social Tennis Club; architect, T. R. Eagar; 6 villas in Belgravia-av. and Ulsterville-pl. for W. J. Orr; architect, T. Callender; villa on Ballygomartin-rd., for G. A. Hill; architect, W. C. Porte; workshops in Loftus-st., for Clendinning & Swann, builders; shop on Oldpark-rd., for A. M. Dongan; architect, C. A. Aickin; 4 villas on Newtownards-rd. Upper, for H. Mills; architect, J. McGeagh; villa in Knocklofty-pk., for R. J. and T. Kerr; architect, T. R. Eagar; additions to P.E. school in Mill-av., Ligoniel, for the Belfast E.C.; architect, R. S. Wilshere; P.E. school in Fane-st. and Tate's-av., for the Belfast E.C.; architect, R. S. Wilshere; Parochial hall in Fortwilliam-av., for the Select Vestry of St. Peter's church; architect, A. W. Brown; shops and dwelling-house on Donegall-rd., for H. McLaurin; architect, W. C. Maxwell.—The Corporation has adopted a minute of the joint Law Improvement and Housing Committees recommending that tenders be invited for the completion of the streets on the Seaview site and the erection of 100 houses.

BLACKPOOL.—It has been resolved that the architect (Mr. E. D. Dennis) be instructed to erect houses in accordance with his lay-out on land purchased from Mr. W. Flint, on the Hoo Hill Housing Scheme.

BRACEBRIDGE.—Plans are being prepared for the erection of a new mental hospital.

BRADFORD.—The Corporation's education schemes comprise the erection of a boys' grammar-school at an estimated cost of £150,000, together with a secondary school on the Bolling Hall-estate, at an estimated cost of £76,900. The R.C. authoities propose to erect a new R.C. day school at Leeds-rd., for the Church of St. Peter, together with a new R.C. day-school at Bierley. The architects for the latter two schools are Messrs. Empsall, Clarkeson & Clarke, Bradford.

BRIGHTON.—The T.C. are to be asked to sanction the purchase for £2,000 of premises adjoining the Municipal Technical College for the extension of that institution.

BULKINGTON.—The following plans were submitted and passed by U.D.C.: Bungalow, Nuneaton-road, for A. Kyte; 2 houses in Coventry-road, for J. Hardy; cinema at Rieton, for Frank Voce, Nuneaton.

CATERHAM.—Plans for the erection of new buildings were received as follows by the Town Planning and Housing Committee of the U.D.C.: 2 pairs semi-detached dwelling houses, Hollidays Bottom, W. Butler; detached dwelling house, Court-road, C. G. Hollands; detached bungalow, Banstead-road, A. Crundell; conversion of 102 and 104, Chaldon-road (Alma-terrace) to 2 shops and dwelling houses, H. H. Dean.

CHERTSEY.—The Housing Committee has reported to the U.D.C. that Capt. Bellamy, agent for Mrs. Rickman, had written agreeing to the purchase price of £1,312 10s. for the 5¼ acres of land, for housing purposes, at Prairie-road and Green-lane, Addlestone, and also agreeing that vacant possession would be given on the completion of the purchase. The committee will further report to the Council.

DARTFORD.—Committee have approved of the undermentioned plans: Pair of houses, Watling-street, for W. E. Burke and J. H. W. Burke (subject to an order for combined drainage'; bottling store, Lowfield-street, for John Green & Co.; 2 houses, Stanham-road, for W. J. Brise (subject to an order for combined drainage); house, Firmin-road, for P. S. Avery (subject to an order for combined drainage); 2 houses, 65 and 67, Park-road, for Mrs. M. Phillips (subject to an order for combined drainage'; hall and institute, rear of 30-36, Lowfield-street, for the Parochial C.C. of the Parish Church of the Holy Trihity; bungalow, Green-street, Green-road, for E. J. Jones.

EALING.—Plans passed by T.C.: 6 houses in Tring-av., W., Daley & Co.; 11 in Niagara-av., W. Gardner; 4 in Gunnersbury-av., Newborn & Smith; 3 in Burnfield-rd., C. E. Bottle; 2 each in Argyle-rd. and Brutonway, by the Foundation Co.; one in Gunnersbury-av., by A. Lyford.

EASINGTON.—The R.D.C. is to make application to the M.H. for sanction to erect a further 50 houses.

EASTBOURNE.—In their report the Buildings Committee recommended the T.C. to approve the following plans of new buildings and extensions: Rowsell and Ticehurst, builder (architect, A. Ford); house and garage, junction of Dillinburgh and Upwick-roads; Weller and Seymour, builder (architect, C. Ford) 2 houses and garages, King's-avenue; I. S. Causton (builders, G. Bainbridge and Son), South Cliff-avenue, "Atherton," internal alterations; L. MacLachan (architect, P. D. Stonham; builders, J. Bodle, Ltd.) Cavalry-crescent, block of 3 dwelling houses; S. D., Foulkes, builder (architect, C. Ford), St. Philip's-avenue, 5 dwelling houses; R. Winsloe Patton (architect, F. G. Cooke), Vicarage-road, St. Anthony's School, sanitary block; Shell-Mex, Ltd. (builders, Shell-Mex, Ltd.), railway goods yard, Hampden Park, office; Newman and Andy (architect, P. D. Stonham), 6A, Grange-road, alterations forming stables.; A. Avard builder (architect, S. Box), Milton-crescent, pair of houses and garages; H. J. Lavender, builders (architect, W. R. Hamblyn), Milton-road, pair of houses; Eastbourne Corporation, No. 7, Victoria-drive housing site, 40 houses (the by-law as to inspection chambers to be complied with); Mostyn Hotel Co., Ltd. (architect, P. D. Stonham; builders, G. Bainbridge and Sons) King Edward's-parade, Mostyn Hotel, additions; Eastbourne College (architects, Tatchell and Wilson), Old Wish-road, Eastbourne College, new masters' and butlers' quarters; H. M. Simmons (architect; P. D. Stonham; builders, J. Bodle, Ltd.), Langney-road, 3 lock-up shops; J. J. Fillingham (architect, F. C. Benz; builders, Tanner and Sons), Park-avenue, detached house and garage).

EPSOM.—Plans for alterations and additions to Fairmile Hatch, for Sir G. Rowland Blades, M.P.; for a house and garage in Fairmile-lane, for Messrs. Osmans; for a house in Anyards-road, for E. G. W. Hounsom, and for a new cottage attached to Leigh Hill cottages, for Major Benton Fletcher, were formally approved at a meeting of Epsom R.D.C.—Plans for new buildings approved by R.D.C., included a shop store in Eversley-rd., leading to the District Council's housing estate on Surbiton- hill, and a number of new dwelling-houses and garages in various parts of the district.

GREENFORD.—The Ealing T.C. have passed plans for 22 houses west of Greenford-rd. and south of King's-av., for A. J. Perkins.

HORSFORTH.—The following plans were approved by U.D.C. unconditionally: House in West End-lane, for A. E. Allen; 54 houses, Cragg Hill housing Estate (Section 5), for U.D.C.; farm house in Broadgate-lane, for the Stanhope estate.—Subject to the signature of combined drainage agreement, the following were approved: House and workshop off Town-street, for J. W. S. Walker; 4 houses in Victoria crescent, for Read Bros.; 2 houses in Beech-avenue, for F. Furness; and 4 houses and garages in Victoria-mount for J. R. Micklethwaite.

HOVE.—The Corporation has approved the following plans: C. Scott, pair semi-detached houses, Davigdor-rd. (north side); Hunter & Bedford, for W. J. Keene, 2 pairs of semi-detached houses and garages, Berriedale-av. (west side); W. Willett, Ltd., house Princes-cres. (west side); W. Willett, Ltd., house, Princes-cres. (west side); Parsons & Cresswell, for Rev. Fawcett, conversion into flats, 24, Brunswick-terr.

IPSWICH.—Plans for the erection, at a cost of £6,000, of a new cemetery chapel, in which a crematorium will be incorporated, were approved at the annual meeting of the Ipswich Burial Board. Mr. J. A. Sherman is the architect.

LAMPETER.—Plans of new houses for T. M. Williams, Pensingrug, on the Bryn, and for Enoch Davies, Tyhen, at Pleasant-hill, were approved by R.D.C.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A COPY WILL BE SENT BY RETURN, AND YOUR REMITTANCE REFUNDED IF THE BOOK DOES NOT SATISFY YOUR REQUIREMENTS.

B. T. BATSFORD, LTD.

TRADE NEWS

St. John's Church, Rochdale.

We learn that with regard to the Church of St. John, Rochdale, illustrated in our issue for April 29, the reinforced concrete and "Empire" stone dressings were the work of the Empire Stone Company, Ltd., of Thanet House, 231, Strand, W.C.2.

"The Autocar."

The current issue of *The Autocar* is a much enlarged special number devoted mainly to the needs and interests of newcomers to motoring. The special features in this "New Motorists' Number" deal in a practical, yet at the same time, entertaining, way with the many things that the new owner of a car wishes to know, and ought to know, while an achitect contributes some valuable hints regarding the construction of inexpensive garages suitable for the usually limited space available with suburban or small country or town houses.

The Carlton Theatre.

We understand that the stone carving to the front elevation of the Carlton Theatre, illustrated in our issue of April 29, was executed by Messrs. E. J. and A. T. Bradford, Sculptors and Craftsmen, of 62A, Borough-road, S.E.1.

Travelling Exhibit of Radiators.

The travelling exhibit of the National Radiator Co., Ltd., Hull, of radiators and "Ideal" boilers, will visit and give demonstrations at the following points in the Leeds district :—Friday and Saturday, May 20 and 21, Mr. Henry R. Lax's ground, Nunroyd-avenue, near Street-lane, Chapeltown; Monday, May 23, open space at bottom of Easterly-road, Harehills, Roundhay-road; Tuesday, May 24, open space, West-park, Far Headingley; Wednesday, May 25, Leeds Corporation Motor Park, bottom of Cookridge-street.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Aberdeen.—It has been decided to build a church hall at St. Clement's Parish Church at an estimated cost of £3,600.

Arbroath.—Extensive repairs are to be carried out by T.C. on the Corporation water works at Glenogil, following damage caused by recent storm.

Bishopbriggs. — Houses. — The Housing Committee of the County of Lanark, Lower Ward, have commenced extending their housing scheme at Springfield, Bishopbriggs. At present they are erecting five blocks of tenements, with six houses to each block. The buildings are of brick, and are to be roughcast with cement.

Brechin.—The Town Council has agreed to erect another two blocks of houses of four rooms each on Cookston-road.

Edinburgh.—Edinburgh Dean of Guild Court has granted a warrant to Moss Empires (Limited) to proceed with the reconstruction of the Edinburgh Empire Theatre. The cost of the reconstruction is estimated at upwards of £50,000, and the principal alteration will be an increase in the seating accommodation to make the auditorium hold 2,000 people. Other petitions granted included C. H. Dunlop—Four double bungalows at Stevenson-road. John Hope's Trustees—Workshop and garages at Annandale Street-lane. James Miller (Interim Warrant)—Two double houses at corner of Queensferry-road and West Barnton-terrace. James Robb—Nine garages at Trinity-grove. Danish Bacon and Co-operative Trading Co., Ltd.—Warehouse and garage at 201, Leith-walk. Thomas Paris and another—Double villa at Craigleith-road.

Fraserburgh.—Gas Works.—The T.C. at a special meeting considered the proposals of the Gas Committee for the erection of new works. The committee decided to recommend the Council to erect new works, at cost of £20,000, with up-to-date plant, on the site at Mid-street belonging to them.

Glasgow.—The U.F. Church Presbyte are to purchase a site for a church in Beacon field-road, close to the large housing sche at Kelvindale.

Kilsyth.—Houses.—The Central Distr Committee of Stirling County Council h resolved to proceed immediately with scheme for the erection of 40 houses in t Kilsyth area on the understanding that would be built as subsidy houses by Willi Baird & Co. (Ltd.), coalmasters.

Montrose.—Bridge.—A joint conference the Montrose T.C. and Forfar C.R.B. una mously resolved that the new bridge over t river South Esk at Montrose, to supers the present suspension bridge, be construct of ferro-concrete, to the design of Sir Ow Williams, engineer, London. The cost estimated at £73,450.

Scottish Electricity Scheme.

Details are published of the scheme p pared for the Central Scotland Electric area. The scheme, which is issued by t Central Electricity Board, provides for eig capital stations for the production of pow for the central industrial area of Scotla to take the place of the 36 stations gener ing electricity in the area at present. T various stations are to be inter-connected a series of high-pressure main transmissi lines. The scheme also provides for tra forming stations and other equipment. T standardisation of frequency is an importa additional element in the scheme. T capital expenditure in connection with t scheme, it is estimated, will amount by t end of the financial year 1933-34 £5,975,000. The selected stations are Clydes Mill (Clyde Valley Electrical Pow Co.), Dalmarnock (Glasgow Corporatio Falls of Clyde (two hydro-electric station Lanarkshire Hydro-Electric Power C Portobello (Edinburgh Corporation), Yo (Clyde Valley Electrical Power Co.), and a Bonnybridge (Scottish Central Electric Pow Co.), Carolina Port (Dundee Corporatio Dunfermline (Fife Electric Power Co.), a Kilmarnock (Ayrshire Electricity Board).

BUILDING TRADE WAGES IN SCOTLAND

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

. CXXXII. No. 399. MAY 27, 1927.

THE COMING R.I.B.A. ELECTIONS

BY this time every member of the R.I.B.A., who is available, will have received his voting papers. It would seem natural to conclude that every member who has not yet returned his vote would now be seriously gaged in thought as to how he intends to make use of it, the best advantage of the community, the profession, d, as a natural corollary, of himself. Unfortunately, experience of previous annual periods such as this, points to a ry different state of affairs.

Year after year the number of voting papers that have been ade use of have been a deplorably small proportion of the eat number which have been issued. The wonder is that e Institute has remained the live and representative body hich it is, and that it has retained its essentially democratic aracter, in spite of this neglect of the elements of democracy the part of a vast body of its units. The whole essence democratic government lies almost entirely in the ercise of individual freewill, and however fortunate may have en the results to date, we are always faced with the danger a Council out of touch with the will of the majority, or still rse, obsessed in self interest. The idea may be inconvable at the present time, but the risk is there for each one o fails to register his vote to face.

It is easy to become a non-voter, because it is always so ich more easy to do nothing than to do something; but it very difficult to enter into the mentality of the non-voter, cause his attitude is so illogical and so entirely indefensible. The Institute is a body which exists for the purpose of proting fine architecture, and the prosperity of architects; and ery member who benefits by its existence or who has its jects at heart—and we presume that there is none so foolish to pay an annual subscription for no reason at all—is rally bound to share the responsibility of maintaining its presentative constitution by the agency of the ballot.

"I shall not bother to vote. The Institute has never done e any good, and I do not suppose it ever will," is the lightarted remark so often heard in reply to the casual canvasser. may be representative of the thougthless opinion of the ajority of those who fail to register their votes, and it is perhaps e very poorest reason of all. It would be an easy matter show in what many ways the Institute has proved itself useful service to the profession at large, and to the inidual practitioner, and in what ways both might suffer its absence; but such a line of argument is no conclusive swer to the inertia of the voter, but rather a justification. is more convincing to concede, hypothetically, the justice of e charge, and so show how doubly necessary it is under such cumstances that the voter should function. There are few sgruntled constituents so friendless as to be unable to find fficient sympathisers to promote a candidate who could ice their views in council. The framework of the Institute's nstitution is designed for this very purpose, and there is no superable fence about it to exclude any candidate who can irly claim to represent the opinions of a considerable body of s fellows.

Another type of non-voter is the man who professes to be o conscientious and too alive to the importance of the vote, to use it in support of men about whom he knows very little, and who are no more than names to him. With this attitude one can sympathise to some extent, and it would be unassailable were it clear that a fair knowledge of the merits of most of the candidates were inaccessible to those who really want to know. It must be felt, on the contrary, that any member who maintains throughout the year, a live interest in the activities of the Institute, by attending every possible meeting, or, failing this as a possibility, by studying the reports of such meetings as given in the Institute Journal, as well as in the technical press, can acquire a far better idea of the individual activities of the executive, than can the average parliamentary voter of those of his member. In addition to this, a little trouble in sounding the views of friends more "in the know" will do much to fill in the gap; while the Council representatives of the Allied Societies in the provinces exist to keep touch with those whose contact with London is slight.

The remaining type of non-voter is just the lazy man, if indeed this class is not included among the first we have spoken of. With him, also, some sympathy may be felt, for are we not all prone to laziness in some form or other. Perhaps for this same reason, we would like to reach him above all others, and so feel that an irksome effort had been made, and a new activity initiated. May we, therefore, tabulate our advices to voters?

Don't withhold your vote because you do not know for whom to vote; but bestir yourself to find out all you can about the candidates.

Don't excuse yourself from voting on the score of the sometimes alleged impotence of the Institute; for it is just such as you who have the power to make it potent if it should be lacking.

Don't vote in an irresponsible spirit. Better strike out a name than vote for it simply because you know nothing against it.

Don't vote for a name for the sole reason that you have seen it under a fine architectural design. It is not always the cleverest architect who makes the soundest administrator, though it is often the case.

Don't, on the contrary, vote for a man whom you know to be indifferent to fine architecture; for the Institute must maintain a love of its art.

Don't exaggerate the value of your vote by voting for fewer than the full complement, if you can possibly avoid it.

Don't leave it until the last minute, to post your papers. The scrutineers will be busy enough without a final scurry.

Don't forget you have received your papers.

Don't forget to fill them in.

Don't forget to post them.

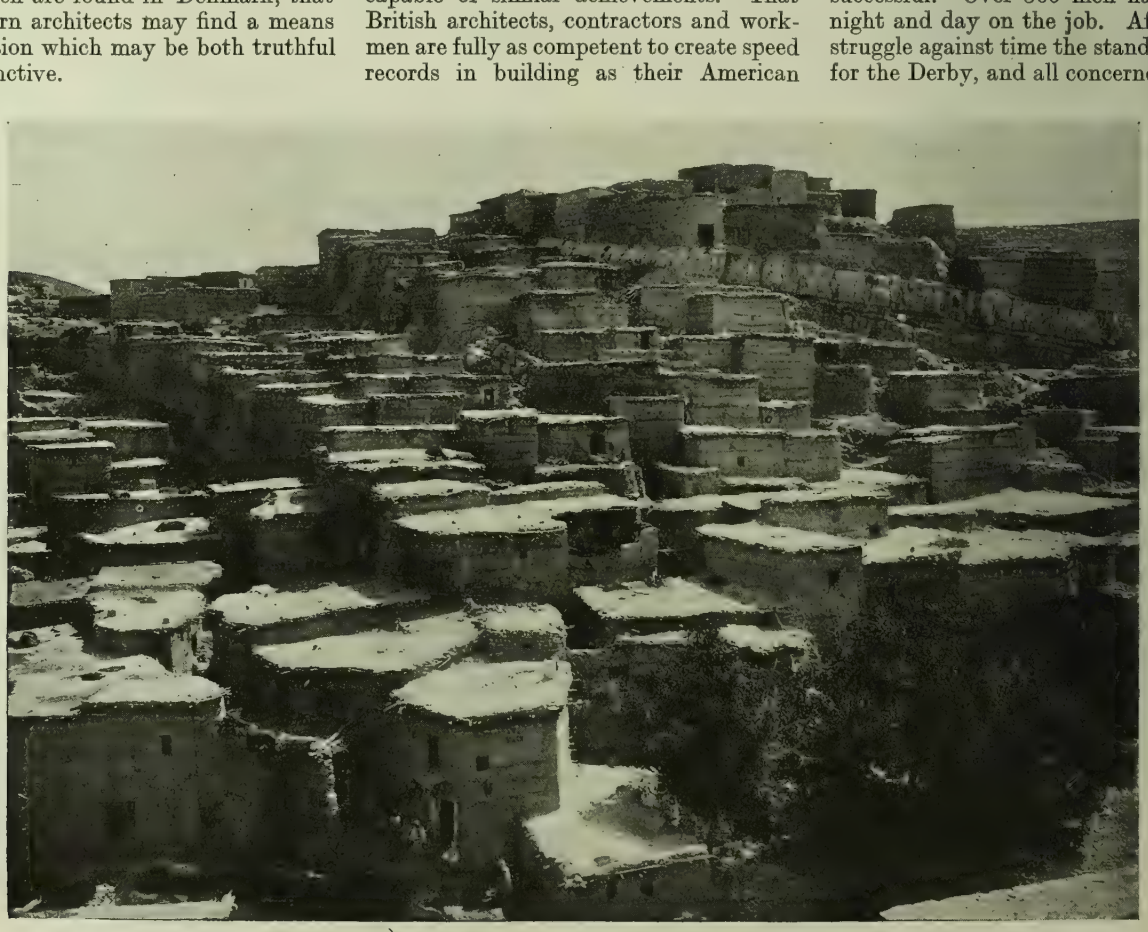
And, finally, don't fail to make it your business to urge the importance of the vote upon all your professional friends and neighbours, and so assist to make this year's election a record both as to aggregate of votes polled, and also as to their proportion to the number of voters on the register.

If our interest in the welfare of the Institute needs an apology or explanation to justify a gratuitous inroad into its domestic affairs, we would add that it is our conviction that a growth of institutional pride in the Institute will mean a better Institute, a better profession, a higher standard of architecture, and so greater service to the community.

NOTES

Danish Architecture.

The interest of the Danish architecture exhibits is by no means exhausted in Queen Square, as a number of good subjects are on view at the A.A. gallery. The impression of the main exhibition in Queen Square is enforced at the A.A., for we find there some work which suggests real appreciation of architectural qualities. Some of the domestic work might almost have derived from this country. The charming drawings of a War Memorial by Gudmund Holme, the original crematorium design by Kaj Gottlob, and the well-proportioned elevation of the crematorium design by Thomas Havning, are amongst the best exhibits. Such exhibitions as this will tend to strengthen the feeling amongst students that distinction of effect may be obtained without the use of applied orders or merely non-constructional features. We have not yet created a modern town or village street of the sustained quality like that which passes through, say, Chipping Campden, but for all that we may learn to produce good design without emulating the picturesque charm which comes from many unnecessary gables in that street. If the conditions of modern life impose the monotony of repetitions and standardisation, we may find alleviation in tone and colour and contentedly accept the truthful interpretation of modern problems. We see a certain room for hope in some modern designs, such as those which are found in Denmark, that our modern architects may find a means of expression which may be both truthful and distinctive.



A Fountain in Fez. (*See page* 844.)

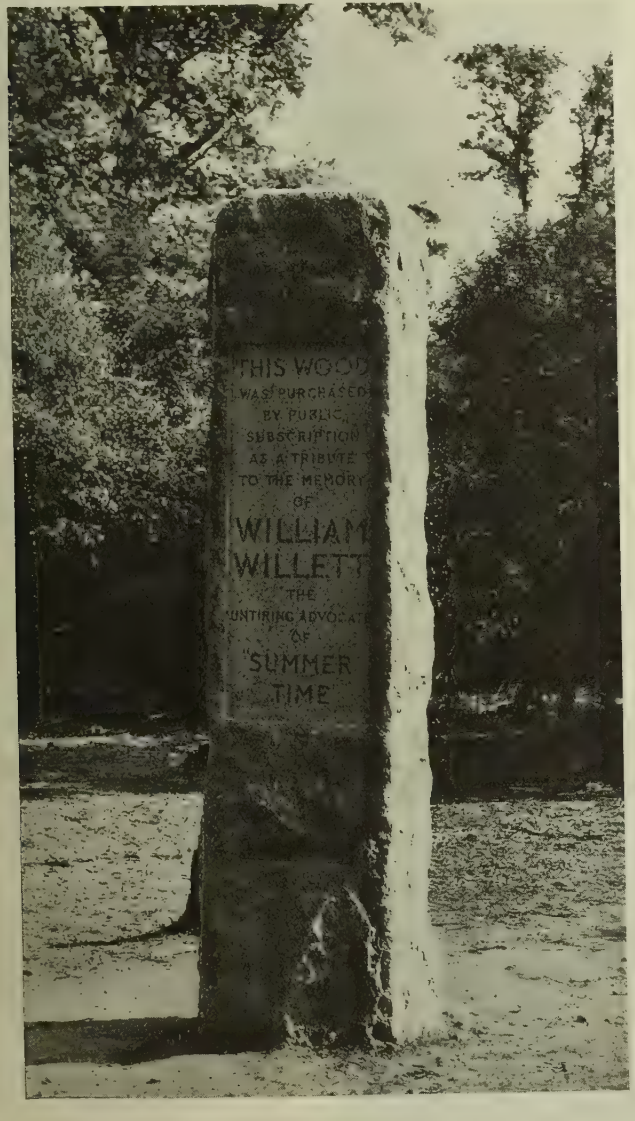
Rapid Building.

We frequently hear reports of the rapidity with which building contractors carry through their jobs in the United States, and of the masterly organisation which makes such expedition possible, and it is sometimes alleged that we in this country are incapable of similar achievements. That British architects, contractors and workmen are fully as competent to create speed records in building as their American *confreres* is shown in the case of the n Grand Stands at the Epsom racecou which we illustrate in this issue. sorts of difficulties dogged the work fr the beginning owing to the prolon coal dispute, but these served only spurs and kept everyone on the *qui* to meet them as they arose. A sport spirit prevailed during the whole of work among the workmen themselv and the railway companies spared pains to help the work through. carrying the huge stanchions wh support the main framework of building, the whole of the traffic alo the railway line had to be adjus to allow for their passage.

The Human Aspect.

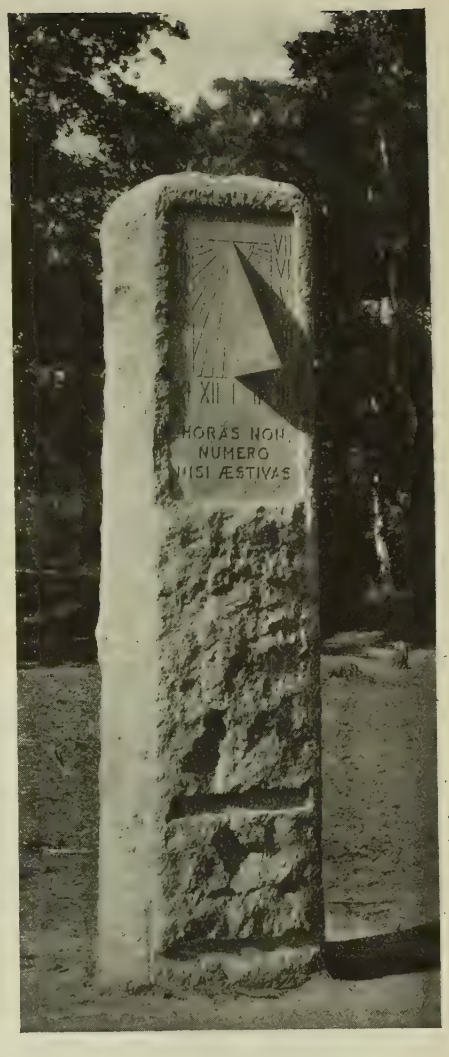
With the object of ensur harmonious working a speedy settlement of qu tions arising on the work, architects arranged for c ferences to be held weekly between the contractors engaged on the wo With a view to further ensuring a go fellowship between all engaged on work the architects had the whole of men to supper in the winter, when a v pleasant evening was spent. Lord Lo dale has visited the work on ma occasions and expressed himself as be very pleased with the spirit in wh the whole job was being tackled, and i mediately on hearing of the supper ferred to above, very generously vol teered to give another supper, which t place in January last, and was eminen successful. Over 500 men have work night and day on the job. After a gr struggle against time the stands are rea for the Derby, and all concerned with

Bouzina, Morocco. (*See page* 844.)



ork are to be congratulated upon a ally notable achievement.

Garages and Subsidy Houses.



The other day we noticed in a newspaper a complaint from a Motoring Editor that garages were not allowed at a subsidised house. ifficulties were evidently placed in the ay when obtaining sanction from local uilding authorities. He desired that the nomaly should be removed. His desire eems to represent a mind curiously out f touch with the national temper. There , of course, nothing to prevent anyone uying a motor-car with the money the tate has given him as a subsidy for his ouse. This is simply one of the tra- edies of the housing problem. All that heavily taxed nation can hope for is that man of this type might for the sake of thers try to be less brazen in his abuse of hose benefits which ought never to have een given him, and were never intended or him. From our point of view it is a airly sound generalisation that if he can- ot afford to build a house, he cannot afford o build a garage. He certainly cannot fford to build a decent one. The whole transaction is shabby in principle, and the natural result is seen in the shabby garden erections which are an eyesore. The problem of the motor-car and the amenities is discussed in an article in this month's *Architecture*.

Dublin's Civics Week.

We note that preparations for a Civics Week, to be held in Dublin, from September the 17th to the 26th, are now well advanced. Mr. Seumas Murphy, the Chief Commissioner, in outlining the scheme, said that it was proposed to institute an architecture medal and a competition for the best-dressed shop windows. Among other features, there will be a military parade and torchlight tattoo, massed bands and aviation displays. The amenities of Dublin have revived to an astonishing extent under its three commissioners, and Civics Week ought to be a great success. Architecturally, Dublin is among the richest cities of its size in the world. Its setting of mountains and sea is magnificent, and it remains to press on with those questions of health and amenity that face all our large towns.

Sundial in Petts Wood, William Willett Memorial, Chislehurst, Kent.

Sundial in Petts Wood, William Willett Memorial, Chislehurst, Kent.

Such problems as slums, town planning, and smoke pollution require as drastic treatment in Dublin as elsewhere.

Mr. William Woodward's Criticisms.

For the past thirty-three years the Institute Annual Report has been criticised or commented upon by Mr. William Woodward at the annual general meeting, and he intimates that this year will be his last appearance as a friendly critic. We must all admit the pertinence as well as the pertinacity of Mr. Woodward's comments during all these years, and we know that his words have been looked forward to as part of the annual function. There has always been something stimulating in Mr. Woodward's remarks, and the stimulation will be found in his latest speech, wherein he says that he would abolish 20 out of the 22 boards and committees, retaining only two, the Board of Architectural Education and the Practice Committee. Mr. Woodward's questions elicited some interesting information as to new Institute premises and other matters. We are glad that a vote of thanks was passed at the meeting for Mr. Woodward's long and interesting contributions.

GENERAL NEWS

Professional Announcement.

At a special meeting of the Wallingford Borough Council last Friday, Mr. C. J. Flooks, A.R.San.I., at present surveyor to the Canvey Island, Essex, Urban District Council, was appointed to the Borough Surveyorship.

Electrical Engineer's Estate.

Mr. George Leonard Scott, A.I.E.E., of Setthorns, Vine-avenue, Sevenoaks (net personalty £128), left £2,302.

A.A. Annual Excursion, 1927.

The A.A. excursion for 1927 will be held during the middle two weeks in September, and arrangements are being made to visit Salzburg, Vienna and Prague. Full details will be given later, but it would be of material assistance if members wishing to join the excursion would enter their names provisionally as soon as possible.

Sale of Architectural Drawing.

It is unusual for an architectural drawing to be sold from the Architecture Room of the Royal Academy, but this has happened in the case of the view of the new buildings in China for the Friends' College, of which Mr. Arnold Silcock, A.R.I.B.A., is the architect. The view, an interior in brilliant colours, was made by Mr. H. L. G. Pilkington, of 2, John-street, Bedford Row.

A.A. Premises.

Progress is being made with the alterations to the A.A. premises in Bedford-square. The Association has been able to extend the leases of Nos. 34, 35 and 36, Bedford-square to fifty years, and additions to the existing studios are being built over the back portion of No. 36. When the alterations are completed the dining-room will be extended for the use of members, and two or three new club rooms will be available for their convenience. The Council has felt for some time that members of the Association, as apart from students, have not been given the club facilities at the A.A. that it had been hoped to give when the premises in Bedford-square were first acquired, but under the new scheme this disadvantage will be removed.

A.A. Costume Ball.

A costume ball in honour of the Danish architects visiting England in connection with the Exhibition of Modern Danish Architecture, arranged by the Architectural Association, will be held in the Galleries of the R.I.B.A., 9, Conduit-street, W, this evening. Dancing is from 9 p.m. to 3 a.m. Tickets, price 7s. 6d., including refreshments, may be obtained from Mr. F. R. Yerbury, Secretary, the Architectural Association, 34, Bedford-square, W.C.

Hospitals and Institutions Exhibition.

This exhibition was opened on May 26 by H.R.H. Princess Arthur of Connaught at the Royal Horticultural Hall, Westminster. Hospital officers who desire to keep abreast of the times should not miss seeing the exhibition, which will afford an excellent opportunity of acquiring first-hand and personal knowledge of the latest and most up-to-date methods necessary to the effective working of their respective departments, in construction, equipment, and domestic arrangement. The exhibition is open to-day from 12 noon to 7 p.m. (Saturday 5 p.m.), and closes to-morrow.

Discoveries Near Ghiza.

Dr. Reisner, the Director of the Boston-Harvard Expedition which has been making excavations of tombs in Egypt, records that on the last day of the season's work in the neighbourhood of the Ghiza Pyramids the expedition discovered the tomb of Queen Meresankh, daughter of Prince Kawaab, and Princess Hetepheres II., who was the daughter of Cheops (the builder of the Great Pyramid). The excavators found cut out of the rock a chapel of three rooms, containing twenty statues and statuettes in niches of the walls. Around the Northern part of the main room the colours of the painted reliefs have been vividly preserved.

Opening of Petts Wood.

Lord Camden, the Lord Lieutenant of Kent, on Saturday declared Petts Wood, Chislehurst, open for the use of the public to perpetuate the memory of the late Mr. William Willett, the originator of "Summer Time." He also unveiled a sundial erected to Mr. Willett's memory. The sundial, which has been placed some distance within the wood, is of Cumberland granite. On one side of it are the words "Summer Time." "*Horas non numero nisi aestivas*," and at the foot of the dial "Summer Time Act, 1925." On the other side is inscribed: "This wood was purchased by public subscription as a tribute to the memory of William Willett, the untiring advocate of Summer Time. Erected 1927."

Liverpool University War Memorial.

The Liverpool University War Memorial, which was recently unveiled by Lord Derby, Chancellor of the University, was designed by Mr. Gordon Hemm (of Messrs. Foden, Hemm, and Williams, Liverpool and Manchester), a former student in the School of Architecture, and carved by Mr. Charles J. Allen, a Liverpool sculptor. The memorial occupies the whole space beneath the large window in the bay immediately facing the main entrance to the Victoria Hall in Brownlow Hill. It takes the form of a triptych in Hoptonwood stone, and the names—in alphabetical order and without decorations or rank being specified—are carved on eight deep panels of ivory-coloured French marble. Above the centre of the triptych rise the arms of the University, supported on either side by a "putti boy" designed in the conventional Italian manner and with downcast head. These figures hold drooping palm leaves, which sweep outwards to the main structure. The ornament is gilded—a feature which overcomes the adverse lighting conditions in the corner of the hall.

This crowning composition surmounts a frieze bearing the main inscription in Greek (the lettering drawn by Dr. Sampson, the University librarian), followed by the English translation "They died yet are not dead."

A Mosque in Fez. (*See page* 844.)

COMPETITION NEWS

War Memorial, Bolton.

In connection with the town's proposed war memorial, three sculptors are to be asked to submit designs for the symbolical panels, and £30 each is to be paid to the two whose designs are not accepted.

Rawmarsh and Parkgate War Memorial.

The following awards have been made in this competition:—

1st, Mr. C. W. Hutton, 7, St. Bee's Road, Bolton.
2nd, Mr. Vernon Constable, Old Tow House, Dundee.
3rd, Mr. E. G. Theakston, Wendover, Bucks.

Municipal Offices, Herne Bay.

The President of the R.I.B.A. has nominated Professor A. E. Richardson, F.R.I.B.A., to act as assessor in a competition for new municipal offices.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The Registration Bill.

Sir,—Your correspondent, "Salaried Architect," evidently does not appreciate the fact that the obvious remedy for the existing grievances is only to be found in a "whole hogger" Registration Bill. If the R.I.B.A. with its powerful influence and organisation cannot pilot one through the House of Commons, there is little hope of any other architectural association succeeding. In fact, an association connected with the profession which does not lend whole-hearted support to such a Bill simply plays into the hands of the Opposition. The result would be that the engineers would cause the vital clauses of the Bill to be rendered inert, if not treated in a like manner to that accorded the Opticians' Bill by the B.M.A. recently.

"Registration Bill."

MEETINGS

Friday, *May* 27.

Architectural Association.—Costume Ball in honour of the Danish Architects. Galleries of the R.I.B.A., 9, Conduit-street, W. 9 p.m.

Town Planning Institute.—Messrs. L. H. Gaunt and Nigel Norman on "Transport." Caxton Hall, S.W.1. 6 p.m.

Friday and Saturday, *May* 27 *and* 28.

Institution of Municipal and County Engineers.—South Wales District Meeting at Newport.

Saturday, *May* 28.

Association of Architects, Surveyors and Technical Assistants.—Visit to New Swimming Baths, Spa-road, S.E. At site, 2.3 p.m.

Monday, *May* 30.

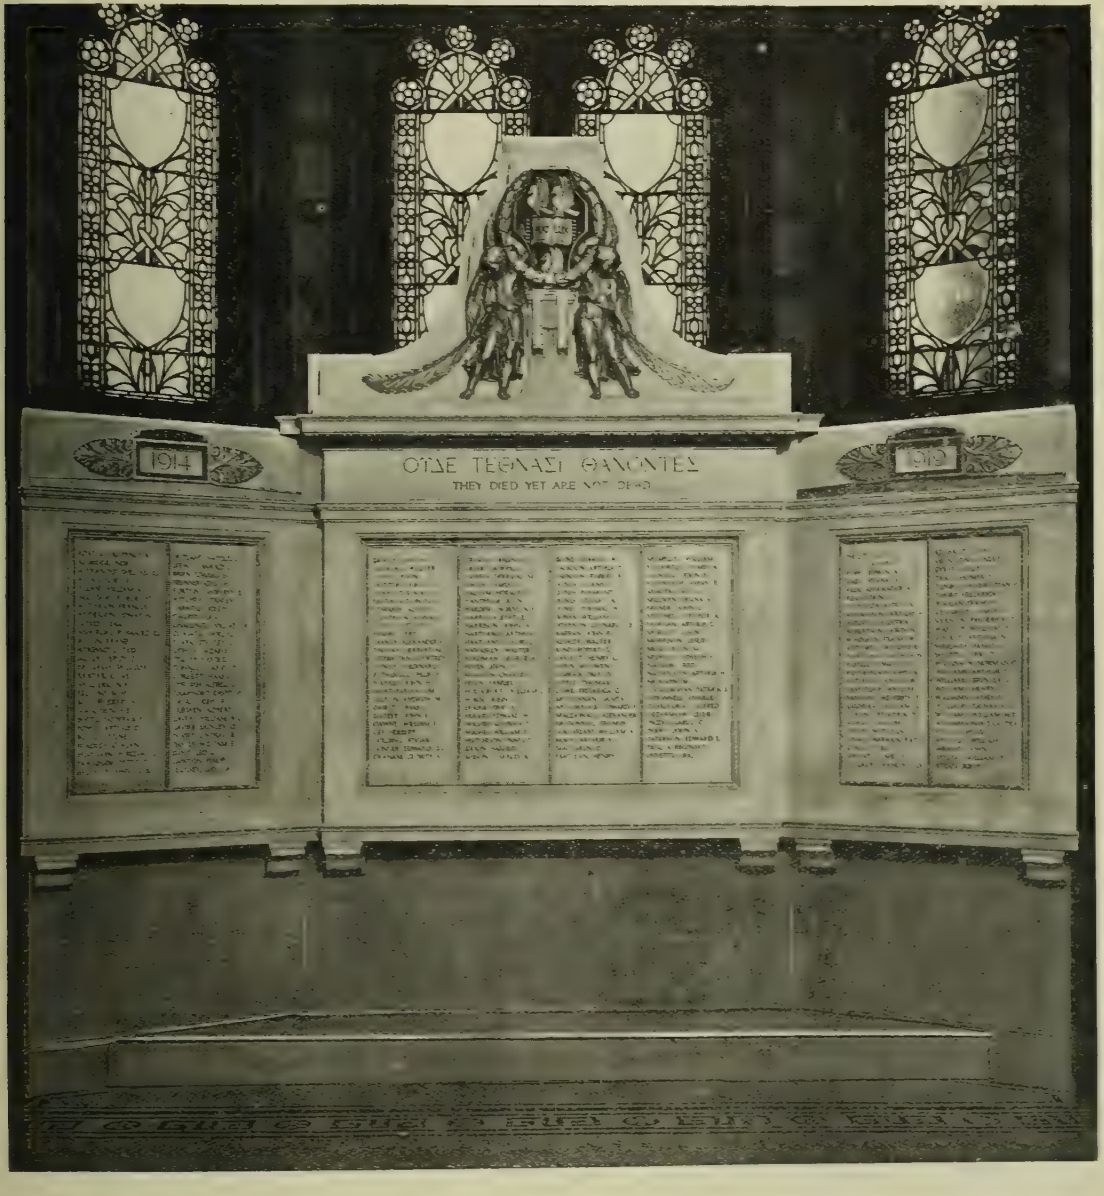
Surveyors' Institution.—Annual General Meeting. Announcement of the election of the Council, and Prize Distribution. 1 Great George-street. 5 p.m.

Royal Institute of British Architects.—Mr. Thomas Hastings on "Devonshire House Buildings." 9, Conduit-street, W. 8 p.m.

Tuesday, *May* 31.

National Housing and Town Planning Council.—Conference at the Council House, Bristol. 11 a.m.

University Lectures.—Mr. W. H. McLean on "National, Regional and Town Development Planning." University College, Gower-street. 5.30 p.m.



Royal Society of Arts.—Meeting of Dominions and Colonies Section. Adelphi. 4.30 p.m.

Thursday, Friday and Saturday, *June* 2-4.

Institution of Municipal and County Engineers.—Scottish District Meeting at Dunfermline.

Detail of Sculpture.

Liverpool University War Memorial. (*See page* 842.)

Mr. Gordon Hemm (Foden, Hemm & Williams), Architect.

"ARCHITECTURE IN NORTH AFRICA."

SIR BANISTER FLETCHER, V.-P R.I.B.A., was in the chair at Monday's meeting of the R.I.B.A., when Mr. Arthur J. Davis, F.R.I.B.A., read a paper on this subject. Opening his address, he explained that having spent several interesting holidays in Mediterranean countries, where among successive conquests and settlements of past civilisations the Mohammedan influence of the Middle Ages left such a lasting impression, he was determined at some future date to renew his acquaintance with the works of Islam by a visit to the ancient cities scattered along the northern coast of Africa. In February, 1925, the opportunity offered itself, and his wife and he, armed with sketch book and camera, set out for a five weeks' tour through Morocco, Algeria and Tunisia to gather some idea of the interest and beauty of these historical countries.

Morocco, although situated within a short distance of many well-known Mediterranean ports, was, until recently, practically *terra incognita* to the tourist, owing to the insufficiency of modern means of transport and the hostile fanaticism of its population. Even to-day, although the French had built excellent military motor roads, railway communications were practically non-existent, and much of the interior of the country was all but inaccessible. This state of affairs was changing rapidly, and there was little doubt that in the near future Morocco would emulate its neighbours Algeria and Tunisia and reveal its innermost secrets. The Moors would certainly benefit materially by the change, but they would in the process inevitably lose many of their national qualities and that air of calm dignity which was so typical of the dweller in lands where Islam holds unchallenged sway.

Of the many successive conquests which swept over North Africa each one had left eloquent traces of its passage. The Phœnicians, the Romans, the Arabs, then the Portuguese and the Turks, and latterly the French and Spaniards, either conquered the whole country or built military trading settlements along the coast. Ancient Carthage, the greatest maritime nation of antiquity, alone had left no trace of its glory and power. The very situation of its great harbours was conjectural. The tragedy of its fate was overwhelming, and only a few inscriptions collected together in a small monastery bore witness to-day to the greatness of a people whose very existence was a constant menace and danger to its hated Latin rival.

The route they followed, continued the speaker, stretched from the Atlantic coast to the Bay of Tunis and passed through most of the North African cities renowned in the history of the Middle Ages. Sailing from Bordeaux on one of the comfortable ships of the Compagnie Générale Transatlantique, they landed at Casablanca, and from there motored approximately 2,000 miles. By following the main coastal road many interesting districts of the interior had perforce to be omitted from their itinerary, but, even so, a comprehensive study of the places they passed through would require a much longer time than they were able to afford to do anything like justice to their many beauties. Casablanca was the principal port of the Protectorate of Morocco, a mushroom city growing out of the sand, exposed to the west winds which lashed the Atlantic breakers on its open front. As a natural harbour it left much to be desired, but of late a great deal had been done to improve it. France, with a touching confidence, was proud of Casablanca, for whatever else might have been accomplished by others in Morocco, here, she said, was a place of her own creation.

Their first objective was Marrakesh, 190 miles south. On leaving Casablanca the road for some distance ran parallel with the Atlantic, and an occasional glimpse of the ocean relieved the monotony of an otherwise uninteresting countryside. After skirting the coast for about sixty miles they reached Mazagan, one of the forgotten settlements which still bore witness to the enterprise and daring of the old Portuguese adventurers, who, in the sixteenth century, opened up the Atlantic coast of North Africa to European trade. There were several other cities on this coast, but none that bore with greater nobility of character the marks of a former great civilisation.

After Mazagan, the road left the coast and proceeded in a southward direction towards Marrakesh, which was situated at the intersection of several passes leading through the slopes of the Lower Atlas. Gradually the landscape became broken and rocky as they neared the snow-capped mountain ranges, which appeared more and more majestic as they approached their destination through a forest of graceful palm trees, above which emerged in the distance, in all its magnificence, the great Katoubia Tower, dominating the city, and visible for miles around. He did not think that any general description of Marrakesh could be adequate. It was a kind of dream city, a jumble of sand and palms, heat and dust, beauty and misery.

Like all old Moorish cities, Marrakesh was encircled by strongly fortified walls pierced at intervals by magnificent horse-shoe gateways, rich with conventional ornament, and often embellished with coloured tiles. These entrances, in their splendid scale and decorative finish, together with the square towers and beautifully ornamented tombs, were, perhaps, the most characteristic motifs of the mediæval architecture of Morocco.

To anyone who had seen the Alhambra and the Alcazar, a visit to the Saadian Tombs would recall many characteristic features of the cities of Andalusia. It was a matchless work of art, faultless in proportion and exquisite in detail. For generations few knew of its existence, for it was the memorial of a fallen dynasty, and its safety lay in its being forgotten. They entered through a narrow opening in the outer wall and passed, without pause, into the dim silence of the tombs. Fine massive columns, blackened by age, sustained arches which upheld an ornamental dome of superb workmanship. Below lay the graves of the departed Sultans, some of marble, some of cheap plaster, and others of blue and green glazed tiles. The whole interior was suggestive of the dim majesty of those powerful Moslem rulers who reigned a century and a half and claimed descent from the Prophet Mohammed himself.

Adjoining the Jama El Fna (a great open square) were the souks, or bazaars, a labyrinth of narrow, rush-covered streets and alley-ways, bordered by innumerable small booths open to the thoroughfare, through which the stream of busy, excited people jostled and elbowed their way. Every vista formed a complete decorative composition. The drinking fountains, ornamented with delicately coloured tiles, the variety of shops, the absence of all vulgar signs and lettering, and the highly decorated entrances to the mosques and shrines formed a succession of pictures of which one never tired.

On leaving Marrakesh they returned to Casablanca, where they had to interrupt their journey, there being no alternative route to Rabat, the principal seat of residence of the Sultan and the H.Q. of the French Protectorate. Salee, seen from the distance, appeared as a city of gleaming silver, with terrace upon terrace of flat-roofed houses, and was the older town. In Rabat the Eastern note was dominant. A prominent feature was an old castle, known as the Kasba Oudaiya, facing the Atlantic and overlooking Salee. High walls with battlements encompassed it, and a magnificent gateway in red stone enriched with inscriptions led to a small white village built round a Mosque. Older still than either Rabat or Salee, the abandoned city of Shella, originally founded by the Romans, brooded over her vanished glories and now merely sheltered the dilapidated tombs of departed Sultans.

The road from Rabat to Mecknes, their next stopping place, first wound through the "Bled" (open country), which they presently left and passed through a forest of cork trees on emerging from which they received their first impression of Mecknes with its outline of countless towers and minarets silhouetted against the evening sky. They approached by a main road which encircled the city, ran under a ruined double archway, and then passed the nine gates for which Mecknes was famous. This city, with its buildings of the fantastic proportions of an Assyrian palace was a prodigious monument to its builder that magnificent but blood-thirsty tyrant Moulai Ishmael, the man who had the temerity to demand the hand of a niece of Louis XIV. The colossal schemes he conceived were carried out by Christian slaves, who were sacrificed in thousands to his insane ambitions. His stables, the mighty arches of which still stood, accommodated 12,000 horses, and a stream of running water in covered stone gutters flowed through each stall. He even contemplated building double walls from Mecknes to Marrakesh, a distance of some 300 miles, the traces of which were still visible. Moulai Ishmael had left behind a sinister record, but nevertheless he was to be remembered for his great architectural conceptions. He was responsible for the massive gateways, of which the Bab Mansour was the best example. These were all superb compositions in the Moorish style of the seventeenth century. One through the colossal portals, one found Mecknes to be a city of serenity and elegance, with streets relatively straight and clean, shop fronts elaborately incised, and in the souks life, animation, and brilliant colour.

The road from Mecknes to Fez led through a rugged country of undulating plain sparsely populated, with great open stretches which made them realise the illimitable vastness of the country. Midway between the two towns they came upon a village of great historical renown. Perched like an eagle's nest on the summit of a rocky crag, it was built by Idris Ab Allah, the founder of the first dynasty of the Moslem rulers in Morocco. Idris was a relative of the Prophet. After having sustained a crushing defeat at the hands of the predecessor of Haroun al Raschid, the immortal Caliph of Bagdad, he escaped into Morocco and founded Moulai Idris, which bore his name. In the valley below lay the ruins of ancient Volubilis, the outpost city which marked the extreme limit of Latin penetration westwards. Roman settlements in Northern Africa, of which there were many, were purely military. Volubilis, about the size of Pompeii, was built of local stone and showed all the characteristic features of similar remains in the outlying colonies of the Roman Empire. In the small museum, among the collection of fragments and details from the excavations, he was in

ted to find a tablet on which was ibed:

'This stone has been erected to the glory the Emperor Commodus by the officer nmanding the levies from Britain."

ntinuing their journey through bleak, country, they approached, with feelings gh expectation, Fez the mysterious, the capital of Moghreb, closely guarded the outer world for a thousand years. as situated in a deep valley surrounded ugged hills. From its aloofness, and its essible position, one realised how hazard- t was for strangers to attempt to pene- its secrets before the French conquest, t 15 years ago. Imagine, if they could, y of 120,000 souls without a single road enough for a carriage, much less a motor- to drive through, and where even a l stroll was impossible without a guide. e midst stood one of the great sanctuaries e world, the tomb of Moulai Idris II., carried on the holy work of his father founded the original city of Fez. igers were warned on passing not to e in the doorway, for fear of offending eligious scruples of the devout pilgrims ered about its walls.

om Fez they proceeded towards Taza, e they were again among the slopes of Lower Atlas Ranges. Taza they found e a poverty-stricken place, as French prise had not fairly reached it. This their nearest approach to the war zone ie Riff district where two months later El Krim caused so much anxiety to our bours. Military outposts were dotted he surrounding hills, and it was re- ing to see the roads patrolled by the us Foreign Legion and efficient-looking e troops, led by French officers

Tlemcen, which vied with Granada as a of art and learning in the fifteenth ry, they were permitted, for the first to enter a mosque, which contained a courtyard, where the worshippers made ablutions before performing their devo- . Beyond the city, the ruins of Man- h, surrounded by almond and olive rds, formed an impressive background he Mansourah Tower. The back wall, stairway, the upper platform, and the zin's turret had fallen in, but the ruin, its golden masonry glowing in the sun- in its peaceful surroundings, had an cribable charm.

ntinuing east, the Corniche Road, with tains looming up on one side, and a drop to the Mediterranean on the , passed through several prosperous ch villages. After spending a night at s they enjoyed the most picturesque part eir journey so far. Up and down, l narrow hairpin bends, with nothing to nt the car diving hundreds of feet into sea, the Corniche Road wound through lwooded gorges and wild country until aspect changed, and a stretch of maca- with tramlines brought them into the rbs of Algiers, the capital of the colony. ers reminded one of a French town, lugh turbanned Arabs and veiled women ed along its boulevards. In striking ast the Kasbah, the old Turkish ter, with its ancient gabled houses ost meeting overhead and leaning wearily igh wooden struts, appeared untouched Western civilisation. Its narrow lanes steep, picturesque and indescribably . There were many good examples of ques, and these were not closed to un- ers as in Morocco.

Constantine, their next important stopping , was situated about 2,100 feet above level. Built on a succession of huge , divided to a depth of 1,500 feet by ans and perpendicular ravines, it was guished by many fine bridges, large cts and tunnels through the rocks. a short stay in Constantine they re- ed their journey, passing through miles rtile but treeless country. This aspect gradually changed, and they were soon amid mountainous scenery again. At Hammam Mas Kutine they saw the hot sulphur springs and their strange lime deposits, whose medicinal virtues were well known to the Romans.

Leaving Bone, a flourishing fortified port, and journeying south, they crossed into Tunisia, where the Romans built many of their cities, notably one at Dougga, now a poor Berber village. The most conspicuous landmark was the Capitol, one of the finest ruined temples in Tunisia. It was approached by a lofty flight of steps and consisted of a cella with a Corinthian portico of six columns, over which was an inscription dating to the time of Marcus Aurelius.

Tunis, a thriving city of a quarter of a million inhabitants, showed a striking contrast between the Eastern and the Western ideas. Here were broad boulevards, planted with magnificent fig trees, close to narrow souks, in which every unpleasant odour assailed the nostrils. At a short distance outside Tunis lay the site of ancient Carthage, once the proud Queen of the Seas. Of this great metropolis nothing remained, and the exact situation of its two famous harbours was still doubtful. The hill on which it was assumed the Acropolis stood was disfigured by a large and indifferently designed modern cathedral, perpetuating the memory of Louis the Saint, who was buried there. The views from the terrace were magnificent, and reached to the distant hills, truly a noble setting for the city of Hamilcar Barca. But, alas! only a few rare fragments found among the excavations recalled the vanished glories of ancient Carthage.

The holy city of Kairwan, a five hours' motor drive due south, was one of the most curious towns in Tunisia, purely Oriental, most of the mosques dating from the Turkish period. Tozeur, still further south, a small town built in an oasis of the shores of lake Djerid, was famous for its baked mud houses, mostly one-storied.

They had now completed the African part of their journey, and it was with feelings of great regret that they said "good-bye" to the mysterious continent.

Sir John W. Simpson, in proposing a vote of thanks, said they had been on a fairy ground and had stepped aside from the grim utility of European architecture into the fantastic period of the Thousand and One Nights. The Moors were very great folk, whose kingdom had extended from Fez to Damascus, Cairo and Bagdad. Not only had they formed the architecture of Spain during their habitation there of 800 years, but that architecture had crossed the Atlantic with Cortes and Pizzaro, and in Lima and other South American cities one could find the walls and gardens which were such a feature of Moorish architecture. It was a great pleasure to be able to propose a vote of thanks to Mr. Davis and his wife—to whom they owed a great proportion of the charming photographs that they had seen.

Mr. Martin S. Briggs, in seconding the vote, said that to a lot of people a more Eastern style of architecture — namely, Egyptian—was more familiar. Some architects objected to the word "Moorish" as describing the architectural style they had just seen, saying that as the style was so closely connected with religion it should be called "Moslem." He felt, however, that the word "Moorish" was right, since it was a good mediæval name and was distinctive. He would like to ask Mr. Davis how the monuments were preserved under French rule. The care taken under the Turks up to the time of their defeat about 1830 was very bad. Also he would ask how the buildings struck him, and also how the buildings were erected.

Dr. J. W. Mackail, in support, said that what thrilled him—as a layman—was the fresh proof of the enormous strength and virility of Rome.

The Chairman then put the vote of thanks to the lecturer for his paper, and this was heartily accorded. Sir Banister said that he—in his trip to Morocco 15 years back—was much struck by the French care. They had left the old cities alone and had built new ones alongside. It was impossible to drive new streets through the old towns. The French gave their cities the proper lay-out and put up buildings that were not copies of anything, which was all as it should be. To his mind the Roman cities of North Africa were of greater appeal than the Saracenic—which was the word he preferred. A visit to either one of these parts—Algiers or Tunisia—would amply be repaid.

Mr. Davis, in reply, said that there was one thing that the pictures had not been able to reveal—that was the colour. The Moorish architecture was alive while the Roman architecture wonderful monuments though they were—was not quite the same. He felt that architecture required what might almost be called local colour. That was why he preferred the Moorish. Regarding the preservation of the old cities, the French had a great man—Maréchal Lyautey—who had done a lot by refusing to mingle the native and foreign styles.

List of Examinations Recognised for the Probationership.—Subjects Required.

Attention is called to the fact that the Council of the R.I.B.A. have decided that history and geography shall be made alternative subjects in the list of subjects required to be covered by the certificates accepted in support of applications for registration as probationer. The revised list of subjects is, therefore, as follows :—

English composition.

Elementary mathematics (arithmetic, algebra, geometry), mechanics or physics or higher mathematics or chemistry.

History or geography.

One language other than English.

Attention is called to the fact that the Council of the R.I.B.A. have decided to exclude after December 31st, 1928, from the list of examinations recognised for the probationership, the Junior (Honours) local examinations conducted under the authority of any university in the British Empire.

A Street in Marrakesh.

On Monday evening last Mr. J. Alan Slater, M.A., F.R.I.B.A. (President), occupied the chair at a general meeting of the Architectural Association, held at 34, Bedford Square, W.1.

House List, 1927-28.

Mr. E. J. T. Lutyens (Honorary Secretary) announced the result of the ballot for officers and Council for the Session 1927-28, as follows :—

President : Mr. Gilbert H. Jenkins.
Vice-Presidents : Messrs. W. H. Ansell and F. Winton Newman.
Hon. Treasurer : Mr. L. S. Sullivan.
Hon. Secretary : Mr. O. P. Milne.
Hon. Librarian : Mr. C. H. James.
Journal : Mr. A. H. Moberley.
Past President : Mr. J. Alan Slater.
Ordinary Members of Council : The Hon. H. A. Pakington, Messrs. L. H. Bucknell, S. C. Ramsey, A. B. Knapp-Fisher, F. C. Eden, Cyril A. Farey, C. Lovett Gill, E. J. T. Lutyens, Lionel Pearson, G. R. Dawbarn.

Votes of thanks were passed to the retiring members of Council (Messrs. A. Trystan Edwards, P. D. Hepworth, and T. S. Tait) and to the scrutineers (Messrs. A. E. Westerman, H. R. Thompson, and D. D. Robinson).

Architects and the Law.

Sir Francis Newbolt, K.C., then gave an address on Architects and the Law. For the purpose of his remarks he would, he said, regard architects as people who had, by misfortune, come to litigation, and it was particularly on their conduct as witnesses that he would like to deal. First, however, he would like to make some remarks on litigation generally. As soon as they came into litigation an architect should employ a good solicitor. In any business matters they should keep copies of all letters they wrote, and keep all letters received; it was also useful to keep a diary. Estimates for work should always be very definitely worded; rather than to say certain work "will not cost more than £300," it was better to say "it will cost at least £300." He would warn them against interference between client and builder, which could lead to enormous confusion and trouble. It frequently happened that a client told a builder to do something that was not in the plans or the estimate, and of which the architect disapproved. He had known cases in which that sort of thing had occurred ten times on one job. Another matter, although a very rare one, on which architects might be involved in litigation, was an accusation of negligence, and to avoid this it was necessary to keep the client fully informed of everything that was done that might cause trouble when the settlement was made.

A large amount of work on buildings was now done by sub-contractors, and this was a likely cause of disagreement. Very often a sub-contractor undertook to abide by the terms of the principal contract, under which the architect had had very wide powers; he could, for instance, refuse to accept work, he could order work to be done again, he could condemn materials, and so on. But when it came to certifying payment the architect certified on account of the principal contract only, and if the amount was reduced this was often passed on to the sub-contractor, who might not know the cause of the reduction. He did not think there was a remedy. The ordinary rule of law was that if a contractor complained of the work of a sub-contractor he must give particulars, but if the contractor knew nothing beyond the fact that he could not get the full amount from the architect the problem was a difficult one. He thought architects engaged on large works might consider the advisability of stating in a document exactly what was complained of.

Architects were also liable to be interested in arbitration cases, but the advantage of arbitration over a proper tribunal in the Law Courts had never been demonstrated. It was not sufficiently well known that the settlement of disputes in the Law Courts was much cheaper than arbitration. A short while ago a building dispute at Brighton was settled by arbitration. The sum in dispute was about £100, and the local arbitrator's fee came to £50. If the case had been settled in the Law Courts the cost would have been £3 only. There were three Official Referees, and every case that went into their courts could be tried by arbitration, if the parties so desired, with an arbitrator with special knowledge, at a fee of £3. An argument against arbitration was that there was no remedy against the award, but in the High Courts either party could go to the Divisional Court, the Court of Appeal, and the House of Lords. Once the parties agreed to arbitrate they could not appeal.

On the question of architects as witnesses, he said the ordinary expert witness was paid by one side, and was bound to be interested in the victory of one side only. In cases in which architects had been witnesses he had generally found it advisable to take the parties on to the building work in dispute, and invariably found they spoke differently on the job than in the courts. In the courts a witness on one side could say a chimney was falling down, while a witness on the other side could say it was perfectly plumb; on the job they got to facts.

During the past seven years he had attempted to cheapen litigation, and had reduced by 75 per cent. the cost of cases in his court. One of the ways in which this had been done was to have one expert witness instead of expert witnesses on each side, each of whom was sworn to speak the truth and paid not to. He had never yet met a litigant who desired a fight to a finish, regardless of expense; opinions had changed since the war, and it was now realised that it was wrong to spend £500 to decide a quarrel about £2. The independent witness was a most valuable person. He was only paid one fee, instead of four or six. One of the objections raised by the parties to the dispute was that the expert witness would, in fact, be trying the case, but in fact the witness only gave evidence before the court, and the court tried the case. In every case with which he had dealt with the aid of an expert witness there had always been the same result—a cordial vote of thanks to the witness by both sides to the case. When each side brought its own witnesses there was a great temptation for them not to mention something that had been overlooked by the other side and that would damage his own side. And why should he do so? He was not paid to injure his own side. Another temptation was to answer a question in a slightly altered form from what he would answer if he were appearing for both sides.

In hundreds of cases he had been able to settle cases over the table, which cost nothing—settling cases in court cost about 10s. a minute. The most important thing was for the defendant to ascertain in advance what he would have to pay and then pay it into court. That saved all subsequent expense. The independent witness would t the litigants the value of the work, and wh they would have to pay.

A vote of thanks to the lecturer was p posed by Mr. A. A. Hudson, K.C., who su gested that a year spent in a legal off would be a valuable part of the architec training, for he had found that some of t most distinguished architects had no idea costs. After some reminiscences of amusi cases, he urged the desirability of the statut registration of architects. Registration, sa.d, would establish a standard in the p fession, and every profession found it nec sary to have a standard. He recalled incident of a few years ago when a contrac engaged on a church decoration and resto tion contract in London refused to carry because of difficulties with the archite They came to the conclusion that would be cheapest to pay damages breach of contract than to complete work. A meeting with the authorities, ho ever, convinced them of the justice of builder's contention, and the chairman formed them that he would carry on "un any member of the Royal Institute of Brit Architects." Such an architect appointed, and the work was completed the satisfaction of all.

Mr. C. M. Hennell seconded the moti and asked one or two questions. One these was as to the meaning of a quest in the Practice Examination at the R.I.B. a few years ago; the question wa "Apart from financial considerations, wh is the legal liability of the client to architect."

Mr. W. Aumonier said that about 60 cent. of the building work in London done by sub-contractors, and sub-contract should be recognised in the contracts. present the forms of contract were betw the architect and the principal contrac only and the sub-contractor was like a shut cock. At present he was serving on a co mittee, called the "Associated Specialis Committee," which was trying to formulat schedule of contract that recognised the s contractor and gave him a definite stat Continuing, he said he was astonished at ignorance of lawyers in regard to archi ture. He was recently engaged on a disp over "extras," and the lawyer, who engaged only the day before the case heard, asked for explanations of such poi as "where does a pilaster end and a colu begin?"; which is the base of a column which the capitol? Of course, he lost case. In his opinion it would be better architects to take a case through themselv because an architect must know more ab his job than a lawyer.

Mr. Gilbert Jenkins expressed the opin that the position of the sub-contractor wo be considerably improved if the architect granting certificates, mentioned definitely sums included for payment to the sub cont tor, and then before the next certificate w granted the architect could ascertain whet the sub-contractors had been paid.

The President asked whether the R.I.B. scale of charges for architectural work w recognised in the courts, and to this the turer replied in the affirmative. With reg to sub-contractors, he always instructed contractor to pay the sub-contractors, an a sub-contractor complained that he had been paid, he (the speaker) would see that did get the money.

Izaak Walton's Cottage.

Izaak Walton's cottage at Shallowf Staffordshire, has been destroyed by f but the contents of the building, which is a museum, have been saved. The cott which is near the main railway line fr Stoke to Stafford, is a half-timbered sev teenth-century building with a thatched r and forms part of the farm that Izaak Wal occupied in his later years, and which bequeathed to the poor of the town Stafford. It was restored three years ag a cost of £570 and was opened as a muse in April, 1924.

EXHIBITION OF MODERN DANISH ARCHITECTURE

n exhibition of Modern Danish Architire, arranged by the Architectural Asson in conjunction with the Danish Archiural Association, was opened on Monday May 23, in the hall of the Art Workers' d, No. 6, Queen Square. There was a e attendance of distinguished visitors, ing many representatives of the Danish ny in London. The exhibition will in open daily from 10 a.m. to 6 p.m., l June 4th.

conjunction with the exhibition, a party Danish architects is visiting England er the auspices of the Architectural Assoion, and, besides seeing many old and ern buildings in and around London, is ing Bath and Wells, Welwyn Garden , Hatfield, St. Albans, Ham House and mpton Court.

t the opening of the exhibition, Mr. J n Slater, President of the Architectural ociation, in introducing His Excellency Danish Minister, Count Preben F. Ahlet-Laurvig, said he thought they would agree with him that that was an imant day in the history of the Architecl Association, when they were met ther to welcome their brother architects n Denmark. They all knew that a very ial link united them to Denmark, since days when a Danish Princess crossed the ers and became Queen Alexandra. As a man full of all queenly grace and charm, endeared herself to the nation and had a very special place in the hearts of y Englishman. Members (he continued) went on one of their annual excursions Denmark and Sweden two years ago would , as some of their pleasantest memories, hospitality and courtesy of Denmark as ressed in the welcome which they received he hands of the Danish architects, and it , he thought, a happy thought on the of their secretary, Mr. Yerbury, that a orocal visit should be paid by Danish itects, and that they should at the same show their work by means of an extion. To them he hoped their visit would nteresting as affording a chance of seeing lish architecture old and new—to oures it would be a pleasure to have an portunity of seeing their work as shown he walls of that hall, which had been lly lent by the Art Workers' Guild.

ith very scanty knowledge of Danish itecture he thought he might sum up main characteristics in the words Simlty, Sobriety and Commonsense, and as it those very qualities which the modern ol of English architects believed and ed that they were themselves attempting btain, there was obviously an added link eveen them. Both nations, too, were ely interested in the problems of town regional planning—the results of this enhiasm were to be found in the city of penhagen, which he understood was erally admitted to be one of the most utiful of European capitals. They had hi, to-day, the pleasure of the society of hr Danish brother and sister architects; h had examples of their work to study n admire, and they had also the added rification of welcoming the Danish Minise His Excellency Count Preben F. Ahlet-Laurvig, who had most courteously coned to open the exhibition.

he Danish Minister, opening the exhibi, said that during the passing centuries le exchanges in architectural art had n place between Denmark and England. en the Christian religion was finally estabed in his country through the tireless gy of the English Queen Emma, English ks foregathered in Denmark and left hr stamp upon the architecture of their Christian churches and monasteries. The nal Cathedrals of Roskilde and Odense, h since had been replaced by newer buildings, testified to the art of English master-builders.

The great Renaissance worked its way to Scandinavia through the Netherlands and Germany, but there was, however, substantial proof that the late Renaissance architect, Inigo Jones, offered substantial help to their great Architect-King, Christian IV., and they recognised his style in several details of the large Royal Castle of Frederiksborg. This architectural influence was, however, not one-sided. From Denmark came to London in the second half of the 17th century the famous architect and sculptor, John Gabriel Cibber, who was greatly favoured by fortune in making the personal acquaintance of Sir Christopher Wren, with whom he for many years was a faithful collaborator. St. Paul's Cathedral, the Royal Exchange, the Monument, the Bedlam Hospital, etc., were eloquent witnesses of this co-partnership.

It was his earnest hope that the exhibition, which he had the honour to inaugurate, would open a new era of collaboration between British and Danish architects and other artists. He thereby declared the exhibition open.

Mr. Emanuel Monberg, President, Akademisk Architektforening, Copenhagen, said he would like to present to the Architectural Association the compliments and most cordial thanks of the Danish Society of (Academical) Architects for the honour shown to their Association by the arrangement of the present exhibition of the more recent works of their members. It was a keen pleasure to receive that kind invitation, as they felt that English and Danish architects had many ties in common, and they, on their part, cherished sincere sympathy and admiration for English architecture. It was therefore a great pleasure to them, when some English colleagues paid a visit to Denmark two years ago; they in Denmark were glad of the opportunity to show their visitors some of their natural scenery, some of their old buildings, and some part of the modern building works in Copenhagen. On that occasion they felt that English architects regarded Danish edificial art with sympathy and interest, and he hoped that some more English architects would visit them in the future.

When viewing the selection of their productions displayed at the present exhibition, he would ask them to bear in mind that they come from a little country where conditions seldom permitted of big architectural tasks, but where, nevertheless, the bones of contention in art also made their appearance, though perhaps, at times, a little later than in the big cultural centres, which perhaps accounted for their having been spared, in a somewhat greater measure than some other places, the architectural incongruities of certain periods. The preceding generation of their architects studied their old commemorable buildings and brick houses, deriving their motives therefrom, while others were influenced by their impressions from Italy. When, somewhere about 10 to 15 years ago, a desire for greater simplicity and purity, such as had been present in their middle-class homes and buildings about the year 1800, made itself felt, a good number of their architects began to employ classical motives, and particularly in the style characteristic of their excellent architect, C. F. Hansen. Many now advocated greater soberness and genuineness in style, and made this the most noticeable feature in the work. The simple and sober style of building was likewise more in keeping with the whole of their social and economic status, and the means at the command of the architect were likewise usually very limited. He once more expressed the thanks of the Danish architects for the kindness and cordial reception accorded to them all.

Mr. E. Guy Dawber, A.R.A., P.R.I.B.A., said the duty he had to perform was an easy one, and also a pleasant one. It was simply to express, on behalf of everybody, their sincere thanks to His Excellency the Danish Minister, for his kindness in opening the exhibition. They all knew that he was an extremely busy man, as all ambassadors and ministers were, and that made his presence there all the more appreciated, giving, as it did, that official support to an exhibition of its kind which was so valuable. He felt (he continued), that Mr. Slater had most ably summed up the general characteristics of modern Danish architecture. It was an excellent exhibition which had been arranged, and he was sure it would be most valuable. It was impossible to exaggerate the value of those International Exhibitions. The more they could know of each other's architecture, painting, sculpture and other arts, the more they would all benefit. He hoped, while the Danish architects were here, they would have an opportunity of inspecting the exhibition of British architecture which was now on view in the Galleries of the Royal Institute of British Architects. He would like them to see what we were trying to do in England.

The Exhibition.

It is evident enough from the many drawings and photographs being exhibited at the Art Workers' Guild in Queen-square and at the A.A. Gallery in Bedford-square that there is a good deal of able intelligence at work in the Danish architectural world. Whilst there is little of the calibre of the Royal Theatre, Copenhagen (scheme 1), by Holger Jacobsen, with its admirably proportioned front (81) almost like a leaf out of Inigo Jones, there is evidence of a determination to show what a severely simple treatment can do as in the hall of the College of Oregaard (180), by Prof. Edv. Thomsen and G. B. Hagen, and the same professor's two excellent interiors of the Mortuary Chapel at Ordrup (179). Six large drawings and a few small photographs illustrate the large building of the Police Headquarters of Copenhagen. It is an able plan suggestive of the treatment of the Manchester Town Hall, and is treated with an appropriate austerity in a fine large manner accentuated by refinement of detail. The St. Luke's Church, Aarhus (31 and 32), by A. Fredericksen and Professor K. Gottlob, is reminiscent of the Romanesque, with lofty round arched windows and a lofty tower at the west end. The entrance front is a perfectly plain wall with a charmingly detailed entrance doorway. The plan shows elliptical stairs and hall at each corner of the building; between them at the entrance is a square entrance hall, and at the east end is a square chancel flanked by columns. The plain walls are crowned by a delicate balustrade. The design is marked by decided skill and originality. Professor Gottlob has another rather similar church at Kolding (53). A striking exhibit is the "Town on the Mountain," with long lines of habitations built round a lofty church, apparently inspired by Flemish types. The impression of the side is a trifle barbaric, but the drawings suggest quite a fine interior. A photograph suggests that the houses are of an equable proportion, of good texture and treated with commendable breadth and simplicity. The architect is P. V. Jensen Klint. The hospital at Ringe (88), by Andreas Jensen, shows an admirable front to the lawn, having the pleasant appearance of a good country house. The Crematorium at Copenhagen (85) is a striking rotunda crowned by a tiled dome and with flanking pavilions crowned in a domical outline with receding slopes of tiles, and it has an impressive effect. The architect is Holger Jacobsen. Some admirable drawings illustrate a good housing scheme by Thomas Havning (59). Fine secondary school schemes by Chr. Kampmann are shown in drawings 92 and 93. One of the best of the country houses is the seashore villa by Henning Jörgensen (90). The plan is worth noting, and the general design is quiet and restful. A block of dwellings at Copenhagen by Kay Fisker is almost appalling in its size. It has about 600 windows in the long front. There are many things besides those we have named which merit notice.

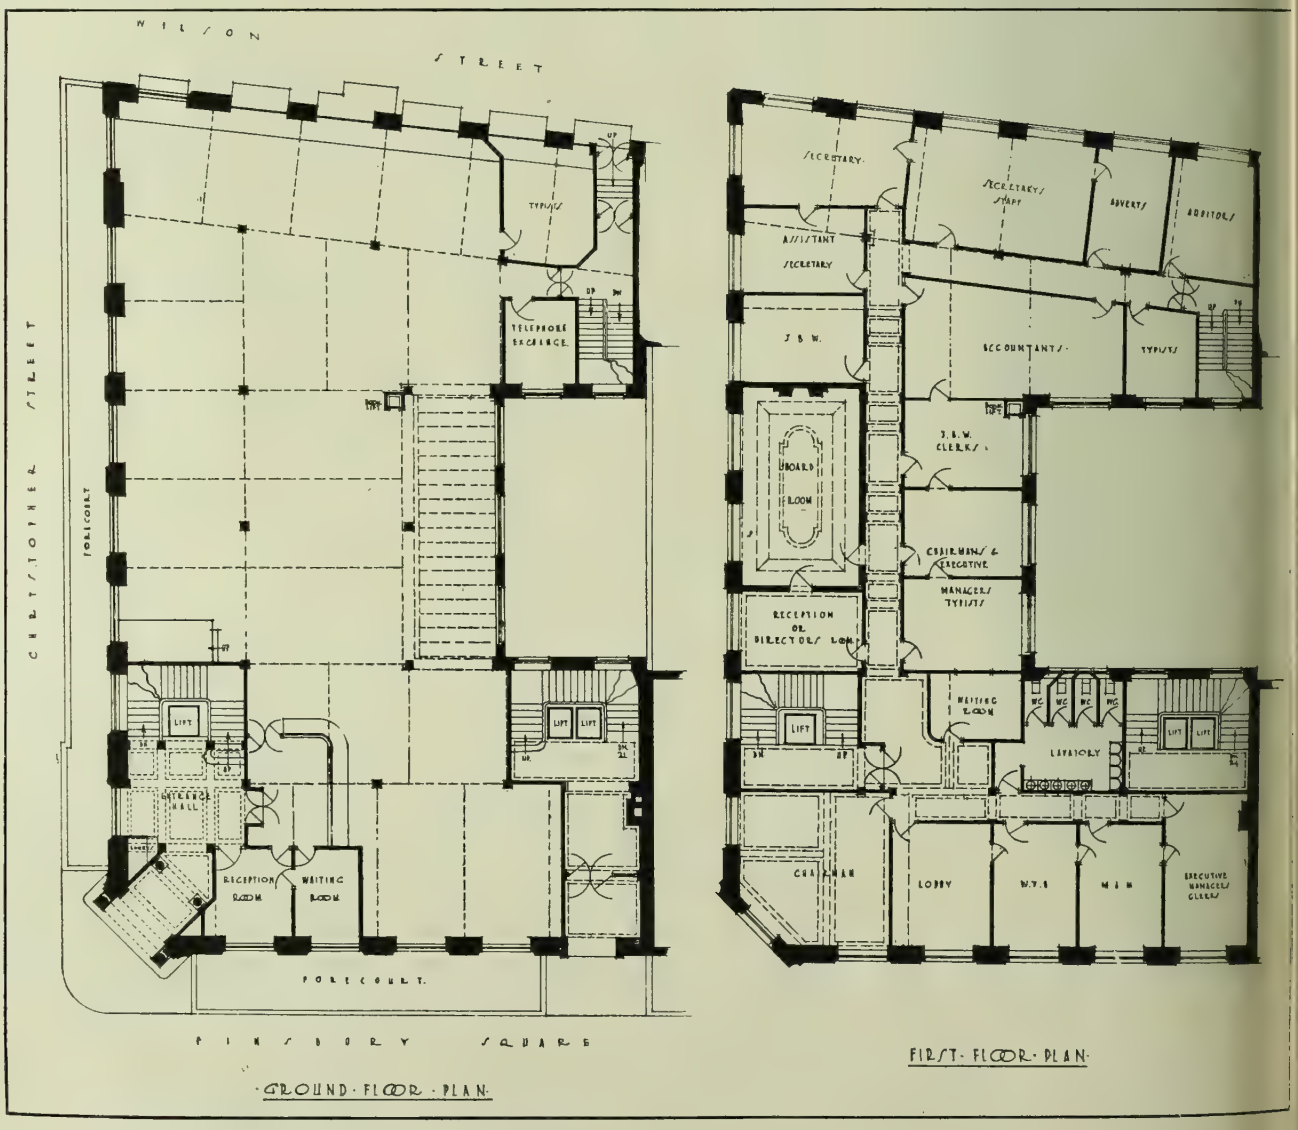
A Gothic Fantasy.

We publish a fantasy sketched by Professor Richardson to show the interest of Gothic architecture. The drawing was made with a quill pen in a few hours, and is reminiscent of travels on the Continent.

New Stands, Epsom Race Course.

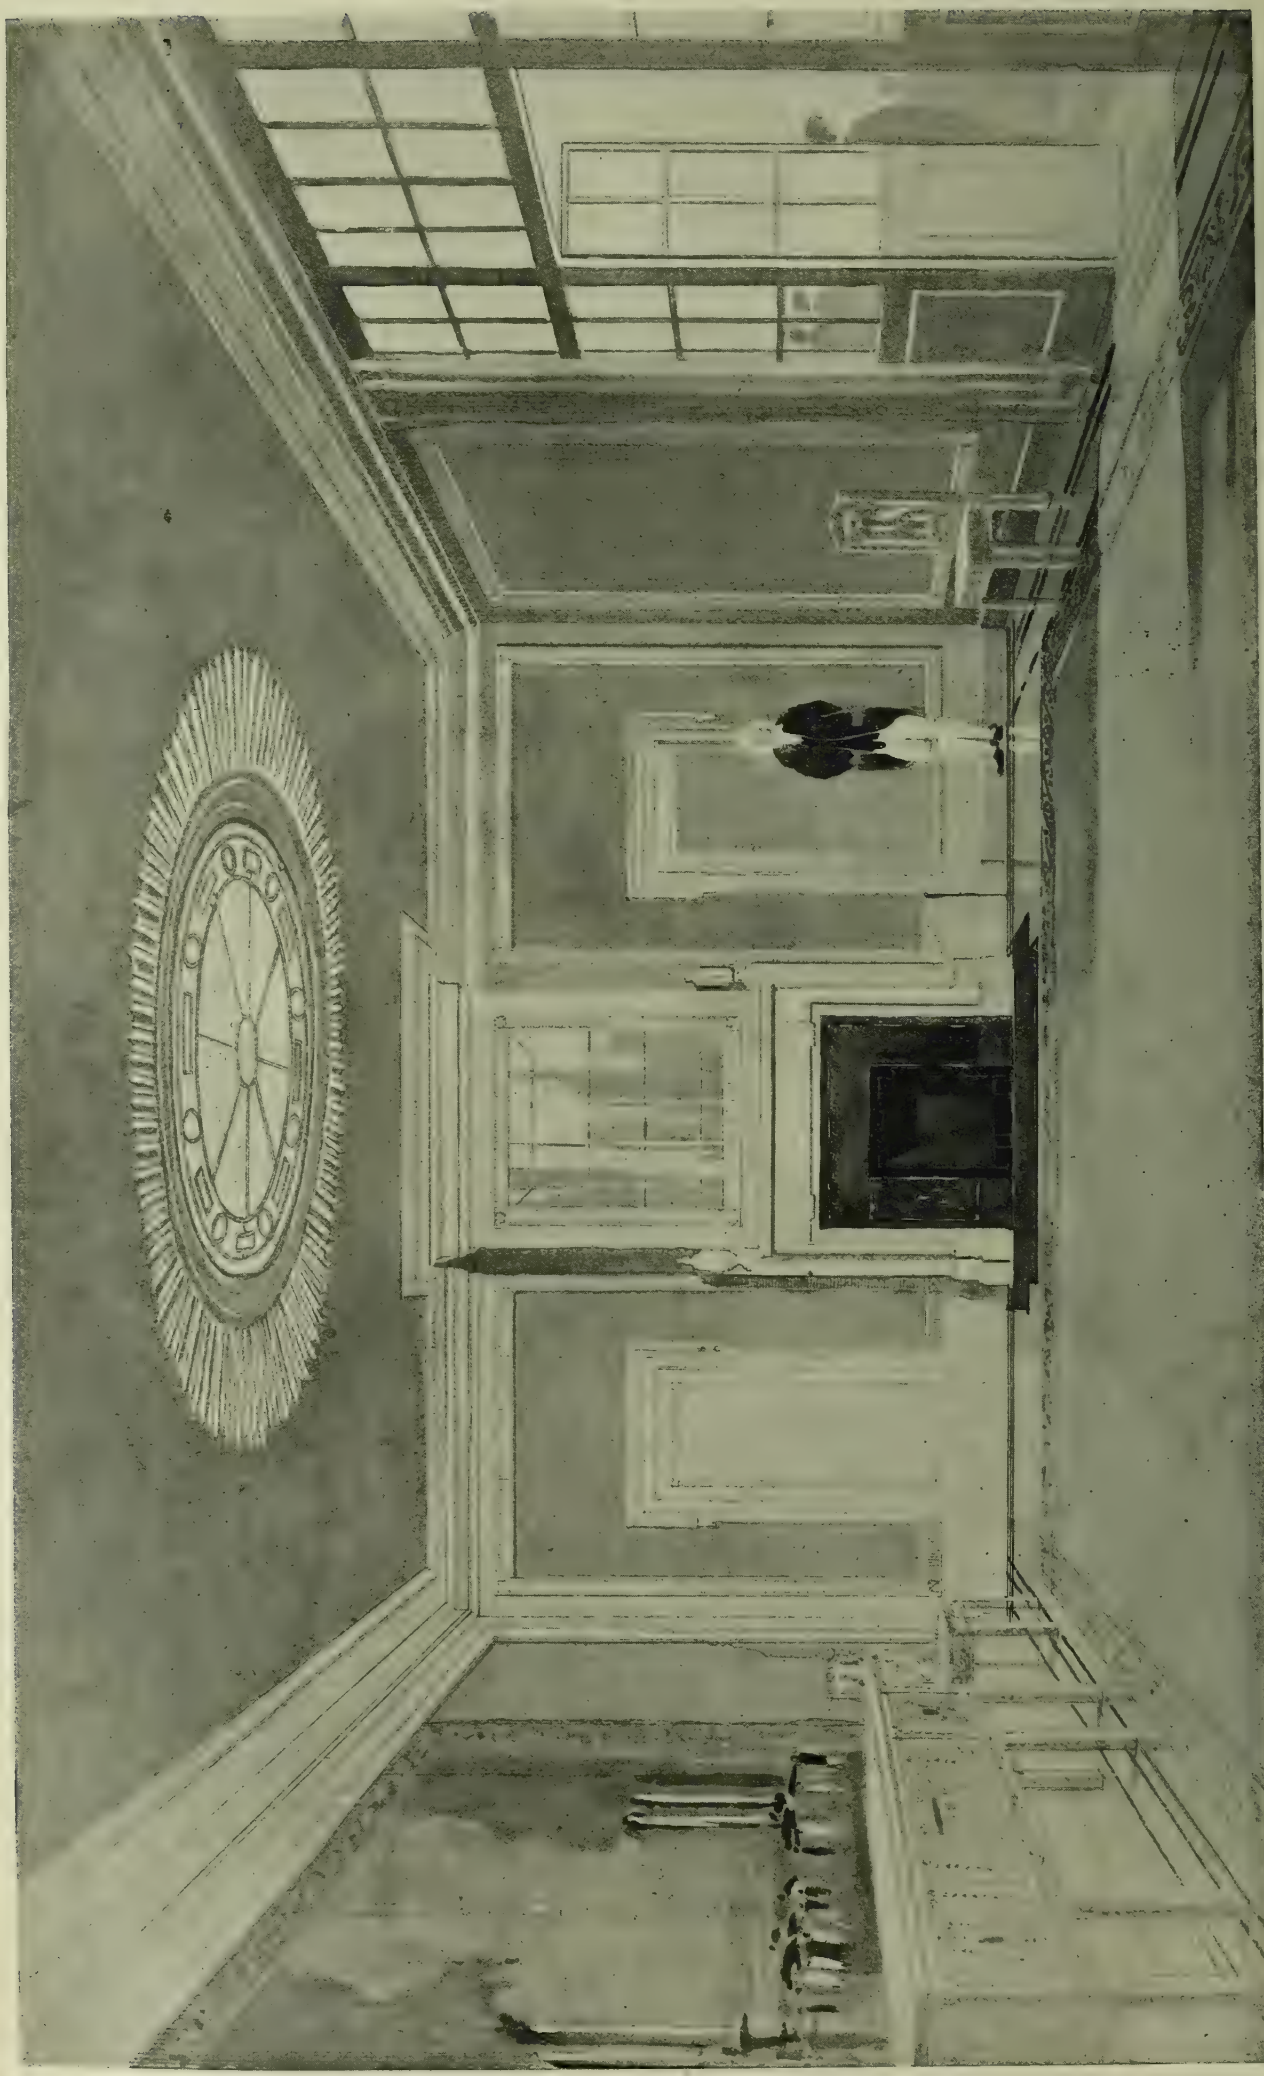
An article on these new stands is given on page 859. Messrs. Reeve & Reeve and Elcock & Sutcliffe, FF.R.I.B.A., are the associated architects.

Maypole House, E.C.



This building, for the Maypole Dairy Co., Ltd., comprises sub-basement, basement, ground, first, second, third, fourth, fifth and sixth floors. It has a Portland stone front to Finsbury Square, artificial stone to Christopher Street, and artificial stone and sand-faced red bricks to Wilson Street. Strong rooms, etc., are in the sub-basement, while lavatory accommodation is in the basement and on the top floor. Cloak-rooms are provided, with a steel locker for each person. There are three lifts, two of which serve the fourth, fifth and sixth floors only. There are two principal staircases on the Finsbury Square side and one secondary staircase on the Wilson Street side. There is a book lift in addition.

Mr. W. A. Lewis, A.R.I.B.A., is the architect.



The general contractors were Messrs. Prestige and Co., Limited, and the following were sub-contractors :—H. Allen, Ltd., demolition and excavation; Lindsay's Paddington Ironworks, Ltd., structural steelwork; Patent Impervious Stone and Construction Co., Ltd., artificial stone; Sa... Bysouth and Sons, Portland stone; Law... and Co., asphalt roofs, etc.; Durato Floo... Co., Ltd., patent flooring; Nicholls ... Clarke, Ltd., and London Sand Blast ... glass; Fenning and Co., granite; Sulzer ... Co., Ltd., central heating; The Engine... Works, Ltd., electrical work; George Wr... Ltd., sanitary fittings; Art Pavements ... Decorations Co., Ltd., staircases, ... Yanedis and Co., door furniture, ... Luxfer Co., casements; Milner's Safe ... Ltd., strong-room doors; J. Avery and ... sun blinds; Cowtan and Sons, Ltd., de... tive plaster, marble, furniture, fireplaces, ... W. T. Allen and Co., and William M... and Co., Ltd., metalwork; Prestige and ... Ltd., joinery; Camden Tile Co., tiling; ... good-Otis, Ltd., lifts; Caston and Co., ... lift cars and enclosures; W. T. Allen and ... bronze entrance doors; Hearne, Hartley ... Rogers, stone and wood carving.

Design for Cottages, Sandringham.

The King has approved of plans ... cottages of old English design to be ere... on the Sandringham estate. Each cot... will have three bedrooms, and there wil... an outhouse, with washhouse and ... store, connected by a covered passage ... the main building. They will be buil... stone and will have iron casements ... leaded lights. The roofs will be cov... with dark, hand-made, sand-faced t... which will produce the effect of ... weathered roofs. Mr. Gerald War... F.R.I.B.A., is the architect.

THE REGISTRATION BILL IN PARLIAMENT

At the second sitting of the Select Committee of the House of Commons which is considering the Architects (Registration) Bill, held on Wednesday, May 18, Major Harry Barnes, Chairman of the Registration Committee of the R.I.B.A., was further examined. Sir Clement Kinloch-Cooke presided.

Major Barnes explained that he had not yet received the list of questions which it was proposed at the last meeting that Mr. Tasker, a member of the Select Committee, should send to him in order that considered replies should be prepared. The witness had, however, compiled a statement which he proposed to hand in and which contained information he had gathered on some of the points raised by Mr. Tasker, first with regard to the conduct by the R.I.B.A. of the examination of District Surveyors; second, with regard to the action taken by the R.I.B.A. in relation to steel-framed buildings; and thirdly, with regard to the action taken by the R.I.B.A. in connection with reinforced concrete construction. [At a later stage in the sitting Mr. Tasker examined the witness on these matters.]

Mr. Lindley asked witness whether the intention of Clause 12 of the Bill, relating to penalties, was to deal with persons who held themselves out as being registered architects but were not, and whether the clause was wide enough to avoid the punishment of anyone who had acted merely by inadvertence.

Major Barnes: There is no intention to punish inadvertence but only misrepresentation.

Questioned by Mr. Lindley with regard to the effect of the Bill on the number of people likely to enter the profession, witness said that they had been guided by precedent in the matter of setting up a body to supervise registration. Realising the feeling against closing the profession, they were endeavouring to make it more open than it was at present.

Mr. Lindley: Are you satisfied that by creating a close professional corporation you will not, in fact, give greater power for closing the profession?

Major Barnes: That will not be the case under this Bill. The powers that have been exercised in the medical profession, for example, could not have been exercised if the medical profession had had a Discipline Committee such as we are proposing under this Bill. If the body controlling the medical profession were a body such as we propose, containing two outside members—one a member of the legal profession and one a representative appointed by the Ministry of Health—then I do not think they would have the powers they use at present.

Mr. Lindley asked whether witness considered that the powers under Clause 7 providing for the removal of names from the register would deter men from coming on to the register.

Major Barnes said he did not think the clause would have that effect.

Mr. Lindley: Will the Council determine what is disgraceful professional conduct?

Witness: No; the Discipline Committee will determine that.

Mr. Lindley asked whether it were true that under the charter of the R.I.B.A. no architect might be a builder or carry on any similar business whilst practising as an architect.

Major Barnes said that that point was dealt with on pp. 101-102 of the code. There was, he explained, no direct prohibition of an architect acting as a builder, but there were certain clauses which, read together, had the effect of making it impossible for an architect to be in such a position that he was under a competitive contract as both architect and builder. What had governed the R.I.B.A. in framing that code was that an architect under our modern system was a person who stood between the building owner and the builder. It was his duty to protect the building owner, who paid for what he got and no more. The architect was not allowed under the code to have any financial interest of any kind in any building for which he was acting as architect other than that of receiving a fee from his clients. The idea of the code was that he should not be interested in building material on the building of which he was architect or the supplies of labour or in any firm of builders who might be quoting for the job on which he was architect. Therefore, while there was no direct prohibition on an architect being a builder, the effect of the clause and the spirit in which it was framed was to preclude an architect who was a member of the R.I.B.A. from being a builder.

Mr. Lindley said he noticed that the code laid it down that an architect "must not attempt to supplant another architect." What would be the effect of the code, he asked, in a case where a man employed by a public authority as an architect took private work and cloaked that private work by putting the name of another architect to it.

Major Barnes: The decision of the R.I.B.A. if such a case came before it would entirely depend on the merits of the case. I should imagine that the facts of the case, as barely stated, and considering what the term "cloaked" implies, would be such that the R.I.B.A. would regard it as a case of unprofessional conduct on which they should take action.

Mr. Lindley asked witness whether he admitted that there were many architects practising to-day who had not any academic training but had made their names largely through experience as workmen and by attending technical schools and were none the less working to the satisfaction of everyone concerned.

Major Barnes: I should not hesitate to say there are. I do not know that I have come across any such persons, but I think it is quite conceivable that there are such persons. I think I can safely say, however, that there cannot be any very considerable number of such persons.

Mr. Lindley: Can you give the committee any idea as to the number?

Major Barnes: No, not at all.

Mr. Lindley: You have made no effort to obtain information on that point?

Major Barnes: I do not think it can really be obtained by any professional body. It would mean practically taking a census of the profession. I think perhaps you might be able to muster 100 men of that kind.

Mr. Lindley: Would not the registration of competent men more or less stigmatise as outside the profession any who did not enter the register?

Major Barnes: They would be entitled to come on to the register, and if they did not do so it would probably be because they did not think it worth their while.

Mr. Lindley: But would they not be regarded as more or less incompetent if they did not go on to the register?

Major Barnes: No. We do not think such a distinction would arise on the passing of this Bill.

Replying to a question by Mr. Lindley regarding the fees to be charged, witness said he proposed to put the committee in possession of information as to what was being done in other professions. It would, he added, be improper for them in this Bill to attempt to bind any body set up under the Bill.

Mr. Lindley asked what was the object of Clause 8 which provided for the restoration of names to the register.

Major Barnes: It enables us to say that a man shall not be disqualified for all time but may be suspended for a specific period.

Mr. Hirst then proceeded to examine the witness, and asked whether they might take it that the R.I.B.A. were the sole promoters of the Bill.

Major Barnes: If I say yes it might create a false impression because the R.I.B.A. is a body so wide in its organisation that it contains not only men who are members of the Institute but also those who are not members as in the case of members of the Institute's allied organisations in Scotland and Ireland.

The Chairman: And Wales.

Mr. Hirst asked how many members of witness's own organisation would be registered under the terms of the Bill.

Major Barnes: They would all come within the different classes of the Bill.

Regarding the number of members, witness said that the total membership of the Institute was 5,129. Of that number the honorary Fellows, honorary Associates, and honorary corresponding members, numbering 13, would probably not desire to be registered. In round numbers there would be about 6,000 members excluding students.

Mr. Hirst: Is there any other body which can be said to be absorbing architects and can also be regarded as professionally qualified to come under the terms of this Bill?

Major Barnes: Such bodies do exist. The R.I.B.A. now comprises also the Society of Architects by amalgamation in 1924. At the time those two bodies were the only architectural bodies in existence. After the amalgamation two other bodies came into existence: the Faculty of Architects, and then an offshoot from that body, the Incorporated Association of Architects. Both those bodies will under the Bill have representatives on the Admission Committee and on the Board of Architectural Education. I cannot speak as to the number of their members.

Mr. Hirst: You cannot speak as to the strength of those two bodies?

Major Barnes: No. I can only assume, taking into account the membership of the R.I.B.A. and its Allied Societies and the very recent formation of these other bodies, that their membership cannot be very considerable.

Mr. Hirst: Has there been any attempt on the part of these bodies to associate themselves with the R.I.B.A. in the promotion of this Bill?

Major Barnes: Yes, there have been negotiations, and as far as I know these two bodies are as devoted to the cause of registration as the R.I.B.A. and are entirely in favour of the Bill. The result of the negotiations led me to believe that their inclusion on the Admission Committee and the Board of Architectural Education would entirely satisfy them.

Major Hirst: Have these negotiations been very recent?

Major Barnes: During the past two or three months.

Mr. Hirst: You are not aware perhaps then that the Incorporated Association is looking on the Bill with suspicion—at least with regard to the administrative parts of it?

Major Barnes: I know that they desire that the council entrusted with the registration should be a council of the nature of the General Medical Council. I have had no discussion with the Incorporated Association since it was decided to qualify the word "architect." I have already pointed out that there is no analogy between the situation that existed in the medical profession and that in the architectural profession. When the Medical Bill was put through, we had bodies of almost equal status, such as the Royal College of Physicians of London, the Royal College of Surgeons of Edinburgh, the University of Dublin with its medical degree, the Society of Apothecaries, and other bodies. Therefore, the only way was to form a general council on which the bodies would be represented. But there is only one body of architects that has any experience or tradition behind it and that has any appreciable number of the architectural profession in it. The position is, however, analogous to that of the veterinary surgeon where there was a Royal College of Veterinary Surgeons which occupied exactly the same position as the R.I.B.A., and in their

arliament said that the position of that dy being so unquestioned they should be trusted with registration. That is our sition, but we have endeavoured to safe- ard the position of all other bodies by ing them representation on the Admission mmittee and the Board of Architectural ducation.

Replying to a further question as to the nding of the Association, witness said he d not wish in any way to reflect on them, t he was bound to say that he did not ink they had up to the present established emselves in such a position as would stify any claim to form a general architec- ral council. They had hardly been in ex- ence more than a year and were themselves offshoot from another body. There had, a matter of fact, been some difficulty in e course of negotiations on account of the alry between the two bodies. He con- lered that the safeguards offered them were they were entitled to.

Mr. Hirst asked whether the Association cluded people who might be described as t coming within the meaning of this Bill.

Major Barnes said he thought their orga- sation included not only architects but also antity surveyors as a distinct branch. In way, the Association occupied a sort of termediate position between the R.I.B.A. d the Surveyors' Institution. The Sur- yors' Institution had a section for quantity rveyors, but they had no such section in e R.I.B.A.

Mr. Hirst: Are any members of the I.B.A. also members of the Incorporated ssociation?

Major Barnes: I have no exact informa- on, but I should imagine only a very small mber indeed.

Mr. Hirst: Is there any reason for this al membership?

Major Barnes: I do not think so. Mem- rship of the Association in the last year so was, I believe, without examination in e first place. I should say that the reasons at induced any of our members to become embers of the Association must be purely cal and personal.

Mr. Hirst said that during the second read- g debate it was stated that the promoters the Bill desired to give every opportunity r working-class people to qualify under the ill. Could the statement that there was nal opportunity for the working-class boy e justified by the number of scholarships sued by the R.I.B.A.?

Major Barnes said there were six scholar- ips in being, and they might run on for ree years, depending on the needs of the oy.

Mr. Hirst asked whether witness had any lea as to the approximate total cost of train- g a boy so that he would be able to come ithin membership.

Major Barnes: I cannot give you a figure f that kind at the moment. Assuming that full course takes five years, you have to aintain the boy during that time. The xamination fees of the Institute would be bout five guineas, and there would be in ddition the fees at the schools. Under this ill a boy from an elementary school would e able to qualify fully as an architect hrough the stages of an academic training, very stage of which could be supplied as far s cost is concerned by grants of scholarships. n the old days the main question to anyone ecoming an architect was that he went as pupil to someone and that someone might ook him for a premium.

Mr. Hirst: That practice has not died out ltogether, has it?

Major Barnes: I think you may say that he educational system of the Institute is illing it. Now a boy can start from the lementary school and there is not a barrier hat cannot be bridged if education authori- ies are fulfilling their obligations.

Mr. Hirst: Is it your view that education uthorities are providing sufficient facilities?

Major Barnes: That is a very large ques- ion, but we are not satisfied, and at the moment I am chairman of a committee that has this matter before them.

Mr. Hirst asked whether the clause dealing with penalties was intended to apply to social and other conduct as well as to professional conduct.

Major Barnes: No. The words in the clause are "disgraceful conduct." There is a lawyer and a representative of the Ministry of Health on the committee and that will ensure a proper interpretation. If I were on the committee I should certainly not interpret the phrase as applying to personal conduct.

Capt. Wallace: Is there any appeal against the decision of the committee?

Major Barnes: The Bill provides for appeal to the High Court.

Mr. Lindley: Will not that be very expensive?

Major Barnes: We considered the question of a lower Court but there were very great difficulties in the way.

Lt.-Col. Moore said he wanted to suggest a small amendment. It had occurred to him that it might create an injustice if the University of Dublin were excluded from the list of bodies whose diplomas in architecture were to be taken as qualifications under the Bill.

Major Barnes said he had no hesitation in accepting the suggestion.

Mr. Tasker was then asked by the Chairman to put his questions to the witness. Mr. Tasker said he saw from the statement handed in regarding steel-framed buildings that the R.I.B.A. was one of four bodies with the right of appeal under the Act of 1909. Had there been a case of appeal since 1909 made through the R.I.B.A.?

Major Barnes said he did not know.

Mr. Tasker: Was it not because of that privilege that the R.I.B.A. sought for rights under the steel-frame Act of last year?

Major Barnes: I am afraid I cannot answer that. As one of the principal bodies engaged in constructional work we have always endeavoured to safeguard our interests under all the Acts. We took the same steps under the 1926 Act that we have always taken.

Mr. Tasker: Did you submit one single proposal to help or criticise the L.C.C. regulations?

Major Barnes: A joint committee was formed with other bodies, and we were associated in the action taken to endeavour to amend the proposals of the L.C.C.

Mr. Tasker: I suggest that the Institute have never shown any activity in this matter except to try and have the right of appeal on certain clauses.

Major Barnes: The four bodies dealing with constructional matters certainly did have before them the regulations prepared by the L.C.C., and they certainly took steps to have those regulations amended in the direction they desired. I understand they achieved their object to a very great extent.

The Chairman said he must ask Mr. Tasker to confine his questions to matters relating to the Bill.

Mr. Tasker said he considered these questions did relate to the Bill.

Dr. Watts: These questions are entirely irrelevant and have nothing whatever to do with the registration of architects but are a purely domestic quarrel between Mr. Tasker and R.I.B.A.

The Chairman: I must rule that these questions cannot be asked and that you must confine yourself to pertinent questions regarding the Bill.

Mr. Tasker: Far from being hostile to the Institute I want to prevent a very unfortunate position arising between them and the greatest local authority in the world.

Mr. Tasker then went on to deal with the question of District Surveyors, and said that according to the calendar of the R.I.B.A. they had passed five men since 1923, although 15 had been wanted by the L.C.C. He would like to ask witness whether the R.I.B.A. were going to accelerate these examinations or put the L.C.C. in the undignified position of holding the examinations themselves.

Major Barnes said the position was that in 1919 they advertised an examination, there were no candidates and no examination was held; in 1920 they advertised twice with the same result. Those, however, were very exceptional years. In 1921 they examined two men; in 1922, three men; in 1923, one man; in 1924, one man; in 1925, three men; and in 1926, ten men. They could do no more than advertise the examination and hold it; they could not compel candidates to present themselves.

Mr. Tasker: According to your calendar no one was examined in 1923, 1924, or 1925.

Major Barnes: In 1923 what happened was that an examination was held and one candidate presented himself but did not pass. That is why his name does not appear in the calendar. In 1924 the same thing happened. In 1925 we held an examination and one man passed. . . .

The Chairman. We have got all this in the statement before us.

Mr. Tasker: I know, but if I may urge you to be a little patient, the witness had explained 1923 and 1924 so satisfactorily that I was just waiting to hear about 1925.

Major Barnes: Two District Surveyors were examined that year; one passed and one failed. There is no entry in the calendar, and in that respect the calendar is deficient in information.

Mr. Tasker: Do you not realise my difficulty when you very kindly send us a calendar and I turn it up and cannot verify information?

The Chairman: How long are these questions going on?

Mr. Tasker: I will not ask any more questions.

Mr. Hirst: I want to say that I think this is very improper. Mr. Tasker is only refusing to ask any more questions because he is smarting under an injustice from the chair. We do not want that sort of impression.

The Chairman: Neither do I.

Mr. Gardner: I want to elucidate a point with regard to one of Mr. Tasker's questions. Is there any reason why so few people are willing to come forward for these examinations?

Major Barnes: I think there may be one or two reasons. First of all, the District Surveyor is not allowed to have a private practice, and that may have an effect on young ambitious men. There has also been a certain amount of uncertainty in late years as to the retirement of District Surveyors, and their tenure of office has been prolonged from time to time, with the result that the prospects of vacancies have not appealed to candidates. The increase in the number of candidates in 1926 was due, I believe, to some changes made in that respect.

Sir Murdoch Macdonald: Is it likely that there has been objection to the strenuousness of the examination?

Major Barnes: I cannot say.

Mr. Hirst: Is this the only channel through which the services of these District Surveyors are secured?

Major Barnes: Yes. The Council of the R.I.B.A. is charged with the duty and the reversion lies with the L.C.C. We have never had any complaints.

Sir Murdoch Macdonald: Neither with regard to the advertising of the examinations nor with regard to their being too hard?

Major Barnes: That is so.

The Chairman again invited Mr. Tasker to put questions.

Mr. Tasker: I do not wish to say anything more.

Before the committee adjourned Major Barnes said that since the last meeting of the committee the negotiations with Northern Ireland and the Ulster Institute had come to a satisfactory conclusion, and it was now desired that Northern Ireland should be included in the Bill.

The committee then adjourned until Tuesday, May 24.

BRITISH ARCHITECTS' CONFERENCE, 1927

LONDON, JUNE 20-25.

The Annual Conference of British Architects will take place in London, from June 20 to 25, and we extract the following particulars from the programme of arrangements which has been issued by the R.I.B.A. :—

All members and students of the R.I.B.A. and all members and students of the Architecural Association and the Allied Societies are cordially invited to attend the Conference. Ladies are particularly invited to be present as guests of members of the Conference. Membership of the Conference is free, but members will individually pay the cost of the items of which the prices are mentioned in the programme.

All members are requested to state on the fly-sheet of the programme which visit they desire to take part in. The numbers for each visit are necessarily limited. It is particularly requested that the fly-leaf should be returned as early as possible, and in any case not later than June 1.

Headquarters.

The Headquarters of the Conference will be No. 9, Conduit-street, Regent-street, W.1. (Telegrams: Ribazo, Piccy, London. Telephone: 0434 and 0435 Mayfair.) Members should call here as soon as possible after arrival to obtain any information, badges, etc., which may not have reached them by post. All correspondence on the subject of the Conference should be addressed to the Secretary, R.I.B.A., 9, Conduit-street, London, W.1

Railway Facilities.

The Railway Companies in Great Britain have agreed to issue tickets, available from June 18 to 27, at the ordinary single fare and one-third for the double journey, to members and their friends who attend the Conference. Members who desire to take advantage of this special reduced fare concession must present at the booking office a signed voucher to be previously obtained from the Secretary, R.I.B.A.

PROGRAMME.

Day of Arrival, Monday, June 20.

9 p.m. to 11 p.m.—A reception will take place in the R.I.B.A. Galleries. Members will be welcomed by the President and Mrs. Dawber. Morning or evening dress optional. Smoking. Light refreshments.

Tuesday, June 21.

10.15 for 10.30 a.m.—The Conference will assemble for the Inaugural Meeting.

1 p.m.—Luncheon interval. (Luncheons will be arranged privately and independently.)

2 p.m. to 6 p.m. *Alternative Visits* :—

Visit A. A Tour of City Buildings.—A char-à-banc drive, with visits to the following buildings:—The Stationers' Hall, the College of Heralds, the Mercers' Hall, the Brewers' Hall, the Mansion House. (Inclusive cost, 4s. 6d. each.)

Visit B. A Tour of City Buildings.—A char-à-banc drive, with visits to the following buildings:—The Fishmongers' Hall, the Customs House, the Goldsmiths' Hall, the Mansion House. (Inclusive cost, 4s. 6d. each.)

Visit C. A Tour of City Buildings.—A char-à-banc drive, with visits to the following buildings:—Trinity House, the Tower of London, the Port of London Building. (Inclusive cost, 6s. each.)

Visit D. The British Museum and the Foundling Hospital.—A char-à-banc drive, with visits to the following buildings:—The British Museum, the Foundling Hospital (passing through the Garden of Russell-square), tea at Holborn Restaurant. (Inclusive cost, 5s. 6d. each.)

Visit E. A Visit to the Inns of Court.—A walk through the following buildings:—The Inner Temple, the Middle Temple, the Temple Church, the Law Courts, Lincoln's Inn, Gray's Inn, tea at Holborn Restaurant. (Inclusive cost, 5s. 6d. each.)

6 p.m. to 8.30 p.m.—Dinner interval. (Dinners to be arranged privately and independently.)

8.30 p.m. to 11 p.m. *Alternative Receptions* :—

F. Reception by the Architectural Association.—(34, Bedford-square, W.C.1) with entertainment and an inspection of the work of the A.A. School.

G. Reception by the University of London School of Architecture in the Bartlett School Buildings (Gower-street, W.C.1), with entertainment and an inspection of the work of the School.

Wednesday, June 22.

10.30 a.m. to 1 p.m. *Alternative Visits* :—

H. New London Buildings.—A char-à-banc drive, with visits to Devonshire House, Bush House and Adelaide House. (Cost of drive, 4s. 6d. each.)

I. New London Stores.—A char-à-banc drive, with visits to Selfridge's, Liberty's and Peter Robinson's. (Cost of drive, 4s. 6d. each.)

K. A Drive round Central London.—Motor char-à-banc drive to Waterloo Bridge, Somerset House, City Churches, Whitehall, Pall Mall, St. James's-street, Piccadilly, Regent-street, Regent's Park, Aldwych and Kingsway. (Cost of drive, 4s. 6d. each.)

L. A Visit to Kensington.—Motor char-à-banc drive, with visits to Kensington Palace, the Museums and Government Buildings in South Kensington, the Albert Hall and Memorial. (Cost of drive, 4s. 6d. each.)

1 p.m. to 2 p.m.—Luncheon interval. (Luncheons to be arranged privately and independently.)

M. Garden Party at Hampton Court, 2 p.m. to 7 p.m.—There will be no limit to the numbers, and all members are especially urged to be present, as the Conference photograph will be taken on this occasion. The party will travel to Hampton Court by motor char-à-banc from the West End via Richmond Park and Kingston to Hampton Court, and return via Ham Common. (Inclusive cost, 10s. each.) The Conference group photograph will be taken at 4 p.m. (Those desirous of proceeding independently to Hampton Court will be free to make their own arrangements.) (Cost, 4s. 6d. each.)

7 p.m. to 8.30 p.m.—Dinner interval. (Dinners to be arranged privately and independently.)

N. Exhibition, 8.30 p.m. to 10.30 p.m.—There will be an Exhibition in the Main Library and the Galleries of the principal treasures of the R.I.B.A. Library, including drawings, rare books, sketch books, etc., arranged by the Literature Standing Committee, who will provide stewards to give information informally about various sections of the exhibition. Smoking. Light refreshments.

Thursday, June 23.

10 a.m. to 6 p.m. *Alternative Excursions* :—

O. Knole Park, Penshurst, and Hever Castle.—A char-à-banc drive to Wrotham, Ightham, Sevenoaks (lunch), Knole Park, Penshurst, Hever Castle, Edenbridge, Westerham (tea); (inclusive cost, 16s. each).

P. Hatfield, Welwyn, and St. Albans.—A char-à-banc drive to St. Albans Cathedral, St. Albans (lunch), Hatfield, and Welwyn Garden City (tea). Inclusive cost, 16s. each.)

Q. Greenwich and Blackheath, etc.—A tour by steamer to Greenwich (lunch), visit to Greenwich Hospital and Observatory, motor char-à-banc drive to Blackheath, Morden College, Dulwich Village (tea), and back by road. (Inclusive cost, 16s. each.)

R. Windsor and Eton, etc.—A tour by motor char-à-banc to Eton, Windsor (lunch), Windsor Castle, and return via Bedford Park. (Inclusive cost, 16s. each.)

S. Ball in the R.I.B.A. Galleries, 9 p.m. to 2 a.m.—A scheme of decoration will be arranged by the Architectural Association (Charge for single tickets, 7s. 6d.; double tickets, 12s.)

Friday, June 24.

10 a.m. to 6 p.m. *Alternative Excursions* :—

T. A Visit to Oxford.—By train from Paddington to Oxford (drive round University and College buildings, lunch at the Mitre Hotel, and return by train. (Inclusive cost, 22s. each.)

U. A Tour of the North Downs.—By train to Guildford, and drive by Farnham, Odiham, Hindhead (lunch), Haslemere, Chiddingfold, Leith Hill, Dorking (tea), Shalford, and back by train from Guildford. (Inclusive cost, 15s. each.)

V. Conference Banquet, 7.30 p.m.—The Conference Banquet will take place in the Grand Hall, Hotel Cecil, Strand, W.C. The Royal Gold Medal for Architecture will be presented to Sir Herbert Baker, A.R.A. (Tickets, 15s. each, exclusive of wines and cigars.)

Saturday, June 25.

10 a.m. to 7 p.m. *Alternative Excursions* :—

W. A Visit to Cambridge.—By train from Liverpool Street, drive round University and College buildings, lunch and tea at the Bull Hotel, and return by train to Liverpool Street. (Inclusive cost, 25s. each.)

X. A Visit to Canterbury.—By train from Charing Cross to Canterbury, visit to the Cathedral, lunch and tea at the Falstaff Inn, and return by train to Charing Cross. (Inclusive cost, 15s. each.)

10 a.m. to 1 p.m. *Alternative Visits* :—

Y, The London Museum; Z, the Tate Gallery.

ACCOMMODATION.

Non-London members are urgently recommended to make arrangements for their accommodation in London during the Conference week at the earliest possible time. In the height of the London season the hotels are liable to be very full.

Messrs. Thos. Cook & Son, Ltd., are prepared to arrange accommodation at any grade of hotel or boarding-house required provided early application is made. The minimum tariffs for bed and breakfast are as follows, but it should be understood that accommodation at these prices is strictly limited.

Superior First Class Hotel, 22s. 6d.
Ordinary First Class Hotel, 15s. 6d.
Second Class Hotel, 8s. 6d. to 15s.
Private Hotel, 7s. 6d.

Members who wish to take advantage of this arrangement are requested to fill up the form attached to the programme, and send it as soon as possible to Messrs. Thos. Cook & Son, Ltd., Berkeley-street, Piccadilly, London, W.1.

HOSPITALITY.—The Executive Committee desire to remind London members of the welcome opportunity of offering private hospitality to their friends from the provinces who will be coming up to London for the Conference week. So much generous hospitality has been extended in the past to London members attending the Conferences in the provincial centres that this opportunity of returning it will no doubt be warmly welcomed, and members will lose no time in writing to their friends in the provinces on the subject.

In view of the great success of the last two Conferences in the provinces it is expected that there will be a record gathering this year, and it is important that notification should be made to Mr. Ian MacAlister, Secretary, R.I.B.A., as soon as possible by those intending to be present.

Fund for Preservation of Tennyson's Home.

The Poetry Society announce that Miss Alice Hunt Bartlett, the American editor of the *Poetry Review* and vice-president of the society, has given a donation of £1 000 to the society's fund for the purchase and preservation of Aldworth, Tennyson's home near Haslemere.

NEW STANDS, EPSOM RACECOURSE

ork on the new stands at Epsom began June 14th, 1926, and was at once held up the coal dispute, which necessitated nediate extraordinary measures being en to get the work done. Accommodation found for 12,000 people for the Spring eting at Epsom in April this year, but the ole of the stands will be ready for June 1927.

The new stands, which accommodate 000 people instead of the 6,600 accom- dated in the old stands, are about 700 ft. g, and 70 ft. high. The whole of the ucture is in three sections, the West Stand cluding the Royal suite); the Centre Stand, l the East Stand.

The length and height of each respective nd are as follows :—

West Stand.—Length, 150 ft.; height, 60 ft.

Centre Stand.—Length, 330 ft.; height, ft.

East Stand.—Length, 210 ft.; height, ft.

There are also 215 private boxes provided, l for each stand separate bar, luncheon m and lavatory accommodation is pro- ed. The whole of the original stand nting the racecourse has been pulled down. the old stand, only the more recently cted dining-rooms at the back remain, l the new stands, extending both east and st, are built over the space once occupied Langlands' No. 1 and Barnard's No. 1 nds. The stand is partly parallel with course, but at its western end—that rer the paddock—is set at an angle to it, s giving everyone a good view of the ight and winning post. Special atten- n has been paid throughout in the design l planning to ensure unobstructed angle vision for everyone, and the elimination of usual large number of supporting nchions. The main girders spanning the nt are 60 ft. in length and weigh nearly tons each.

The West Stand is opposite the winning t. Its length is 150 ft., and it is of four s. Here, on the ground floor, are the keys' comfortable dressing and weighing- rooms. Their Majesties' suite, on the top or, comprises dining and withdrawing ms, and a large terrace box, which is ced directly opposite the winning post. Press box is on the top tier of this nd, and all the tiers are carried on huge tilevers, so that there are no supporting ts on the front to obscure the view. ng the first terrace at the back, behind boxes, runs a large dining-room, 150 ft. g.

Adjoining the West Stand is the Centre nd, where from the ground level to a ght of 30 ft. at the back runs an in- ed tier. The greater part of it is for nding, but a portion is railed off for rved seats, from which direct access is sible to the private luncheon-rooms, built two stories behind the inclined tier. ove this there are three more tiers, with rate boxes, overlooking the course. hind them are wide corridors opening ct on to private luncheon-rooms, etc. It he intention of the directors to fit suitable for access to the boxes, but these will be ready for this year's Derby.

The East Stand, to the east of Tattersall's the Centre Stand, is composed of one e tier, practically all of which is under er. Beneath it are luncheon and refresh- nt rooms. In front, running down to the rse rails, are the lawns.

The floors are of reinforced concrete, and tiers themselves of terra-cotta blocks, being the first time these blocks have n used for this purpose. The outside walls of hollow terra-cotta blocks formed as ls between the steel girders.

All the balcony fronts and the portions ng the lawn are in Atlas White stucco. The back and side portions are treated in a similar manner.

There are two lifts, that for the Royal suite in the West Stand, and that for ladies in the West Stand.

The electric lift, for the personal use of His Majesty, embodies the latest improvements in British lift design, including an entirely new British invention only put on the market during the last few months. This improvement ensures absolute accuracy of stop at floor levels under all conditions. The lift car is a beautiful example of cabinet work, being made of Empire-grown timber, *i.e.*, Canadian maple, inlaid with Indian ebony. In addition to the King's lift, another electric passenger lift for general use, and eight hand-operated service lifts, which will be used to convey refreshments to various parts of the stnd. All these lifts were made in Northampton, and it is not without interest to mention that the Royal lift on the old grandstand was also made by the same manufacturers, Messrs. Smith, Major and Stevens.

In order to provide against the wind pressure, to which the stand is frequently exposed, particulars of the wind pressures over the Forth Bridge for the last twenty years were obtained, and an ample margin of safety has been allowed in the new stands, and a special system of stanchions and steel bracing has been devised to meet the peculiar conditions of the structure. To ease the wind pressure—a dangerous factor in the erection of such buildings—safety valves in the form of openings have been fixed in the back walls.

The architects for the work are :—Messrs. Reeve and Reeve, of Margate, in association with Messrs. Elcock and Sutcliffe, FF.R.I.B.A., of Avenue House, 21, Northumberland Avenue, W.C.2. The consulting engineer is :—Mr. Harold Cane, of 9, Victoria Street, S.W.1.

The contractors are :—Messrs. Howard and Co., Broad Court, Bow Street, Covent Garden, W.C.2. The steelwork contractors are :—Messrs. Heenan and Froude, Ltd., Blackfriars House, New Bridge Street, E.C.4.

Following is a list of the sub-contractors engaged on the work :—J. H. and W. Bell, Ltd., Liverpool, steel erectors; Mellowes and Co., Ltd., metal casement windows and screens; the National Brick Co., Ltd., near Leicester, terra-cotta blocks in tiers, walls, etc.; W. T. Ellison and Co., Ltd., Manchester, turnstiles; Heenan and Froude, Ltd., Manchester, steel gutters; The Wolverhampton Corrugated Iron Co., Ltd., near Birkenhead, protected metal roofing; Messrs. George Jennings and Co., sanitary fittings; Messrs. Bell Bros., Ltd., electrical work; Smith, Major and Stevens, Ltd., lifts; Howard and Co., reinforced concrete and joinery, etc.; George S. Elliott and Sons, Reading, bar fittings; Haskins, Limited, collapsible gates and shutters; Wolverhampton Corrugated Iron Co., Ltd., Robertson opening lights; Haywards, Limited, iron staircases; Mellowes and Co., Ltd., Sheffield, glass canopies; Braby and Co., galvanised cisterns; Marley Bros., Ltd., Aston, locks, bolts and all ironmongery; J. W. Gray and Sons, flagstaves; Bell Bros., Ltd., floodlighting; Rouard Damon and Co., Ltd., glazed lights, Royal apartments; Damman and Co., Ltd., parquet flooring; Diespeker and Co., Ltd., terrazzo paving; Drytone, Limited, panelling, mantelpieces, etc.; Richman, Symes and Co., Ltd., mats; H. H. Martyn and Co., Ltd., decorations, plasterwork, etc., to Royal suite; The Potter Rax Gate Co., Ltd., wire square mesh grillwork and panels; The Novocrete Cement Products Co., Ltd., Novocrete silent flooring tiles; Thomas Faldo and Co., Ltd., asphalt; Aspinalls Enamel, Ltd., enamel.

Canadian Mons Memorial.

A memorial plaque presented to Mons by the Canadian Battlefields Memorial Commission will be unveiled in the Town Hall of that city on June 12. The plaque is commemorative of fallen Canadians.

ARCHITECTS' BENEVOLENT SOCIETY

The annual meeting of the Architects' Benevolent Society was held at the rooms of the R.I.B.A. on Wednesday, May 18th. Mr. W. Hilton Nash, the treasurer, was in the chair in the absence of Mr. E. Guy Dawber, P.R.I.B.A.

The Chairman, moving the adoption of the annual report, said the cost of living had gone up, and larger grants had had to be made. They had been able to meet liabilities during the past year, but still more money was required. He felt that individual architects might subscribe, and suggested a levy of 1s. per member. The Society had received a large donation from Mr. H. S. E. Vanderpant and also £150 from Mr. H. Greville Montgomery. Many friends had given donations, and he thought they might now be asked to become subscribers. Donations received showed that architects generally had confidence in the Society and realised the good work being done. On behalf of the Society he wished to say how pleased they were to have Sir Edwin Lutyens as trustee. Sir Edwin was taking the place of Sir Aston Webb, who resigned on account of health. The insurance work of the Benevolent Society was proving successful, but they would very much like to assist architects further. Concluding, the speaker said that Mr. Vanderpant had been nominated and elected as additional vice-president. The report was approved.

The following were elected on the Council for 1927 to 1928 in place of retiring members :—Mr. H. V. Ashley, Sir Banister Fletcher, Mr. E. Bates, Sir A. Brumwell Thomas, Sir John Burnet and Mr. A. Saxon Snell.

Sir A. Brumwell Thomas, moving a vote of thanks to Mr. Hilton Nash as hon. treasurer for the past year, said his work for the Society was very much appreciated. The motion was seconded by Mr. A. H. Moberley, and carried

Mr. Hilton Nash briefly replied.

Mr. E. Stanley Hall proposed a vote of thanks to Sir Charles Nicholson, as secretary, and moved his re-election.

Mr. W. Henry White seconded the motion, and it was carried.

Mr. A. H. Moberley proposed a vote of thanks to the retiring auditors, Mr. H. Lovegrove and Mr. C. H. Brodie, and moved their re-election.

Mr. E. Stanley Hall seconded the motion, and it was carried.

Sir Banister Fletcher, proposing a vote of thanks to the chairman, said he thought that Mr. Nash might be able to suggest some way of raising money for the Society. He thought it would be a good thing to hold a dinner for the benefit of the Society. The Artists' Benevolent Society did this and raised a large amount in this way.

The vote of thanks was carried unanimously.

The Chairman, in reply, said that the holding of a dinner had been suggested previously, and it did not seem to go far, but it would be brought up again, as some sort of new scheme ought to be started. As regards subscriptions, they had an increase on last year, but as there were 8,000 practising architects, the Society should get more than that.

Smoke Abatement Conference.

With the object of securing the most beneficial results from the new Smoke Abatement Act, the Coal Smoke Abatement Society has issued invitations to every local authority in the Greater London area to send delegates to a conference to be held in July. The Right Hon. Neville Chamberlain, Minister of Health, has agreed to attend.

THE SURVEYORS' INSTITUTION

INTERMEDIATE EXAMINATION, 1927

The following candidates have satisfied the Examiners:—

STUDENTS.

Abbott, H. G., Weston-super-Mare.
Allen, B. C., Beaconsfield.
Ambrose, W. J., Llanelly.
Andrew, F., Middleton.
Andrews, P., N.W.6.
Ashworth, J. F., Blackpool.
Austin, L. C., Arcadia, Pretoria, S.A.
Bailey, H. E., N.W.6.
*Baker, C. F., Eastbourne
Barber, B. H., N.13.
Barnett, H. S., N.W.3.
Barraball, R. M., Launceston.

Tumath, H. E. W., Belfast.

BEQUESTS TO THE R.I.B.A.

The Royal Institute of British Architects have received information of the following bequests which have been made for the purpose of founding scholarships or bursaries for architectural students:—

(1) The late Mr. A. C. Houston, A.R.I.B.A.

Under the will of the late Alfred Charles Houston, the residue of his estate is bequeathed to the R.I.B.A. for the purpose of providing educational and maintenance scholarships for the sons of architects and artists who may be, or at the time of their death were, in impecunious circumstances, such scholarships to be known as "The Houston Scholarships." The amount to be received is not yet ascertainable.

(2) The late Mr. C. W. Hunt, A.R.I.B.A.

Under the will of the late Charles William Hunt, the sum of £500 is bequeathed to the R.I.B.A. for the purpose of forming a fund, the income of which shall be applied annually in the purchase of book prizes, medals, or in such manner as the Institute shall think fit, for the person or persons of British nationality and under the age of 30 years, who, each year, in the opinion of the Institute, submit the best plans, drawings, or designs in connection with housing and town planning or similar purposes. The residue of the estate up to £2,000 is to be divided equally between the vicar and churchwardens of the parish of Burwell and the R.I.B.A. for the same objects as the legacies before bequeathed. The estimated residuary estate is stated to amount to £3,118.

(3) The late Mr. Delissa Joseph, F.R.I.B.A.

Under the will of the late Mr. Delissa Joseph, subject to the payment of certain legacies, the Institute will receive after the death of his wife, one quarter of the residue of his estate for the purpose of founding an annual bursary to be known as "The Delissa Joseph Bursary," to be awarded annually, subject to conditions to be from time to time laid down by the President for the time being, to an approved student or students who shall have passed the necessary qualifying examinations of the R.I.B.A., to enable him or them to visit the United States for the purpose of studying architecture. Each student to whom the bursary is awarded shall, on his return, furnish a written report on his visit, which shall be printed in the "Journal." Mr. Joseph, who died on January 10th, left estate of the gross value of £32,606, with net personalty of £25,925.

THE OLD ASHMOLEAN

In commemoration of those persons who had most to do with the foundation of the Ashmolean Museum in the 17th century, a window containing four memorial panels, which has been placed on the staircase of the Old Ashmolean Building, was unveiled on Tuesday of last week by the Chancellor of the University (Lord Cave).

The two larger panels are in memory of Sir Christopher Wren, who was responsible for the building, and of Elias Ashmole, who handed over his "treasures" to the University and so formed the first natural history museum in this country. In the other panels are commemorated Robert Plot, the first curator, and John Tradescant, whose collection of curiosities passed through the hands of Ashmole to the museum.

Mr. Falconer Madan, on behalf of the Principal and Fellows of Brasenose College, presented the Ashmole light. He said that Ashmole, who was a member of Brasenose, had been described as the greatest virtuoso and curioso of the English nation. He had to confess that Ashmole was vain, credulous, and superstitious, but against that it had to be said that he was a barrister, soldier, botanist, chemist, alchemist, musician, a Herald of the College of Arms, an astronomer and astrologer, an antiquary, a historian, and a Freemason. In 1683 his treasures came to Oxford. Having suffered from the disturbances of that century, he sought a safe repository for his collections and found one in the University.

Mr. E. Guy Dawber, A.R.A., President, R.I.B.A., handed over the Wren light on behalf of that body. He referred to the fact that architecture was not often made a subject of study at the University, and said that he wished it could be considered an essential part of the education of every gentleman as it was in the days of Evelyn and those who followed him. He added that it was surprising to some people that Wren could carry through the work he did with so litle architectural training as he had in 1642, and it was also amazing that he should have been entrusted with such responsible work when it was known that he was without serious training. He was a man of extraordinary natural ability, and though people attributed much to-day to the skilled operatives with which he surrounded himself, his was the scientific knowledge which surmounted difficulties of gravity and durability.

CHELTENHAM HOMECROFT ASSOCIATION

Mr. Charles H. Heathcote, who was a vice-president of the R.I.B.A. in 1922, is the architect (writes a correspondent) for the Cheltenham Homecroft Association (a Public Utility Society, registered under the Industrial and Provident Societies' Act), the object of which is to found a settlement of working-class residences with a garden attached, scientifically equipped to produce as much food as possible for the household. For 16s. 3d. per week rent the tenant is to have a detached house with outbuildings, including a hen-run, a goat-house, and approximately two-fifths of an acre of tree-planted vegetable garden. Some of the houses will be two-storied and some of the bungalow type. Allowing for the credit of a subsidy of £75 per house, it is hoped to complete the first settlement at a net capital cost of £11,000. The freehold has already been purchased, and some of the houses have been commenced. They will be built of concrete blocks with cavity walls, and it is estimated that they will cost £405 each. An interesting aspect of the scheme is the lay-out of the estate. The land stretches from the central roadway for each home to the boundary of the estate. The back part of each croft is not divided by any fence from its neighbour, in order that a rotating cultivator, working by machinery, may dig up each year at least a third of the land, on which potatoes and vegetables may be grown.

SURREY QUANTITY SURVEYORS' COMMITTEE

At a meeting of quantity surveyors belonging to the Surrey County Branch of the Surveyors' Institution, held at the Institution, 12, Great George-street, London, on May 19th, it was decided to form a Quantity Surveyors' Committee for Surrey. The chair was taken by Mr. E. W. Hooper, F.S.I. (chairman of the Surrey Branch), who was supported by Mr. Christopher Chart (member of the Council) and Mr. T. Brent (hon. secretary, Surrey County Branch). The following executive offices were filled, viz.:—Chairman, Mr. Wilfred L. A. Evershed, F.S.I. (Guildford); vice-chairman, Mr. P. W. Freemantle, F.S.I. (New Malden); hon. secretary, Mr. Henry A. Mackmin, F.S.I. (Thornton Heath). A full executive committee will be elected at the next meeting. A scheme of lectures and subjects for discussion is being prepared, and it is proposed to invite all quantity surveyors residing or practising in Surrey to attend the meetings (including probationers and students). It is believed that this is the first county branch of the Surveyors' Institution to inaugurate a committee of quantity surveyors. Any members interested are invited to communicate with the hon. secretary.

George Eliot Memorial

A memorial to George Eliot, in the form of an alcove with a window, was unveiled by Sir Francis Newdegate on Thursday of last week in the reference room of the Coventry Central Library. The alcove was executed by the local Public Libraries Committee, Sir Francis Newdegate presenting the oak from his Arbury estate for the bookcases and the panelling of the wall and ceiling. The window has a floral design, into which are worked scrolls containing the titles of some of George Eliot's stories and books, with a brief inscription of her name and the dates of her birth and death. Several articles associated with her life have been presented and, together with a collection of photographs of scenes and houses in the George Eliot country, will be on exhibition in the library for the next two months

LEGAL SECTION

WORKMEN'S COMPENSATION

TERMINATIONS OF WEEKLY PAYMENTS.

IN our issue of December 24th last, we noted the case Ocean Coal Company v. Davies, which was then only briefly reported. That case involved a consideration of the very complicated section 14 introduced in the Workmen's Compensation Act, 1923, which is now section 12 in the consolidating Act of 1925, entitled in a side note "restrictions on ending or diminishing weekly payments."

The facts are simple. A workman had contracted nystagmus in 1923 and was paid full compensation by voluntary agreement of his employers without any memorandum being recorded. In 1924, again by agreement, the compensation had been reduced from 35s. to 20s. a week. On September 3rd, 1925, the payments were stopped by the employers on the ground that incapacity had ceased, and eleven days after the last payment was made the employers filed a notice for arbitration. On October 13th the workman filed his answer, alleging that he was still incapacitated from work, but on October 24th his solicitors wrote that they were prepared to admit that the workman had recovered from nystagmus, but they were going to argue that the payment could not be stopped until an order to that effect had actually been made in the arbitration. The arbitration was held on October 27th, and the arbitrator held that the only question was whether the payments could be stopped from September 3rd, when it was admitted the man had recovered, or whether they must be continued up to either the date of the application for arbitration or the award, and he came to the conclusion that the weekly payments could not be said to be ended in pursuance of an arbitration within the meaning of section 14 of the Act of 1923 (section 12 of the Act of 1925) until after the award had been made, and therefore the award was made as from September 3rd to October 27th, following the decision in Davies v. Glyncorrwg Colliery Co. (1925, 2 K.B. 339; *The Builder*, April 9th, 1926). This decision was upheld by the Court of Appeal, but reversed by the House of Lords.

The decision of the majority in the House of Lords is based upon the fact that under the principal Act of 1920, with which the Act of 1923 was incorporated, the liability to pay compensation is co-terminous with the incapacity, as was decided in Gibson and Co. v. Wishart (1915, A.C. 18), in which case it was held that where incapacity has ceased it is competent for an arbitrator to terminate weekly payments from the time of recovery, not the date of the hearing.

It was argued that the words in section 14 "in pursuance of an arbitration" mean that the arbitration must have been begun, continued and ended, but it was held that they only mean that an arbitration must take place and the ending of the payment must be in accordance with the finding of the arbitrator. It was pointed out by Lord Wrenbury that an extraordinary result might ensue if this were otherwise. Under section 14 (a) the weekly payment may be stopped where a workman has actually returned to work, but supposing he does not return to work and although entirely cured of incapacity declines to work, then the employer would be compelled to go on making payments until an arbitration could be held, which might mean a delay of weeks, and when it was held he could not recover the payments he had made in the inaterval.

Lord Dunedin dissented from the finding of the majority because he considered it would leave the workman in the same position that he was in before the passing of this section, but as we pointed out in our note on this case on December 24th last, there is one distinction, as now an arbitration must be held. Formerly the payments could be stopped and there the matter ended unless the workman applied for arbitration, but now there must be either an agreement or an arbitration, and in this case the employers applied for arbitration without delay. If they had not done so, of course, the workman could have done so, but that is the position he was in before the section was passed. The legislature may have considered that this was ample security for the workman, and that it was sufficient to declare that a stoppage of payments had no legality unless by agreement or arbitration, being certain that a man convinced of his incapacity would at once apply for arbitration, and there is no real hardship in such a case, although as is shown above, there may be hardship if compensation is to be continued until the hearing of an arbitration, although the man is not incapacitated. All the members of the judicial committee of the House found the section obscure and very difficult to interpret, but the decision and another we are about to refer to delivered on the same day will enable laymen to understand what the operation of the section now will be.

The section commences: "An employer shall not be entitled otherwise than in pursuance of an agreement or arbitration to end or diminish a weekly payment under the principal Act except in the following cases." The above decision shows what is meant by "in pursuance of an arbitration." The "following cases," it will be remembered, are (a) where the workman has returned to work; (b) where the weekly earnings of a workman in receipt of a weekly payment in respect of partial incapacity have actually been decreased; and (c) the special procedure provided by the section; examination of the workman by the employer's medical practitioner and service of his certificate on the workman with an intimation of the employer's intention to end or diminish the weekly payments at the expiration of ten clear days; a counter certificate by the workman's medical adviser which, if disputed by the employer, must be the subject of reference to a medical referee. On the reference to the medical referee the sums in dispute can be paid into court

In the case we have been considering this special procedure had not been resorted to, but there are cases where that procedure has been initiated and then not carried to its conclusion by one or other of the parties. In Davies v. Glyncorrwg Colliery Company (1925, 2 K.B. 339, *The Builder*, April 9th, 1926), where the workman had served the counter certificate but the employer had gone no further and then the workman had applied for arbitration, it was held that the employer was liable for the weekly payments until the hearing of the arbitration for which the workman had applied, although in that arbitration it was found that in accordance with the certificate of the employer's medical adviser the incapacity had ceased at the time the medical examination took place. This case has now been overruled by the House of Lords in Ocean Coal Company v. Davies, and the matter has further been elucidated by the decision of the House of Lords in Niddrie and Benhair Coal Company, Ltd., v. Dee (1927, A.C.299).

In that case under an award made in an arbitration the employers had paid a workman compensation for total incapacity from 1913 to 1925. On September 8th, 1925, the employers had the man examined and their medical adviser reported that the man had entirely recovered. They then adopted the procedure provided by section 14 (c) and the workman had served his counter certificate, which the employers contested and applied for a reference to the medical referee. This application was refused by the Sheriff-clerk, and on appeal by the Sheriff-substitute under section 11 of the Act of 1923 (section 19 in the Act of 1925) on the ground that owing to the exceptional difficulty of the case the matter ought to be determined by arbitration, and the employers then applied for arbitration Under Scotch procedure the workman had, pending the arbitration, sought to enforce execution against the employers and the employers had then under section 14 paid into court the sum in dispute and had since paid into court the weekly payments.

The case is highly technical. The employers contended that they were entitled to stop the weekly payments after the expiry of the ten days' notice on paying the sums in dispute into court, whereas the workman contended that they were compelled to continue the payments until the arbitration had been held. The Scotch Court of Session had accepted the latter view, holding that the case was not within the exceptions of section 14, and declining to suspend execution.

It will be seen that in this case the operation of section 14 (c) was suspended not by default of either of the parties, but by the decision of a court that owing to the difficulty of the case it should not be dealt with by the medical referee but by an arbitrator, but the decision of the House of Lords was that (1) the claim for execution should have been dismissed because under the decision in Ocean Coal Company v. Davies the court has no jurisdiction to award compensation when incapacity has ceased and a suit to determine this question was pending; and (2) the right to pay into court the sums in dispute under section 14 (c) (ii) arises when the application is made under that section to refer the matter to a medical referee and continues pending "the settlement of the dispute," whether that is by the decision of the referee or, as in this case by arbitration, which the difficult nature of the case has required to be substituted for the referee.

The effect of the decisions confirms the view we expressed in our article on Workmen's Compensation, April 9th, 1926. When an employer desires to stop or diminish weekly payments in cases where the workman has either not returned to work or where the weekly earnings of a man in receipt of weekly payments in respect of partial incapacity have not increased (the two cases excluded from section 14), he can do so by agreement or arbitration, or he can resort to the special procedure provided by section 14 (c).

If he intends to resort to arbitration as we pointed out in the above article, he will be wise to give notice of arbitration when he stops the payment. This view is now confirmed by Lord Shaw of Dumfermline in a passage he quotes from Gibson v. Wishart. In that case (Gibson's case) he said: "The employer alleges that the incapacity ceased as at a certain date and that the compensation should cease then, and he, in fact, has stopped on that account all further payments. Assume that the workman denies any change of circumstances and that accordingly a charge for execution of the award is made. In my opinion the duty of the employer in such circumstances is instantly to institute proceedings for review by the arbitrator." Lord Shaw, in quoting in Niddrie and Benhuir Coal Co. this passage from his former judgment, expressed the view that it was still in harmony with the decision now delivered in the Ocean Coal Co. v. Davies.

If the employer resorts to the special procedure provided by section 14 (c) he can when the application is made for reference of the question to the medical referee, pay the sums in dispute into court. If those proceedings are resorted to by the employer but are not followed up by the workman, the workman can nevertheless apply for arbitration (Pudney v. William France Fenwick and Co (1925) 1 K.B. 346; *The Builder*, December 26th, 1924), and we think in the light of the above cases we have been considering it may now be said that if those proceedings become arrested by no default on the part of the employer who has instituted them, then he can also apply for arbitration. But the main point made absolutely clear now is that compensation cannot be awarded beyond a date when the incapacity has been proved to cease to exist, and all those cases where compensation has been awarded up to the date of the holding of an arbitration regardless of the condition of the workman before that date are overruled.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XIX

By H. V. MILNES EMERSON, A.R.I.B.A.

SECTION 70 (Continued).

(d) In a building, being a dwelling-house, very basement room having a wooden floor ther than a floor constructed of solid wood edded on concrete shall have a sufficient pace between the ground and the floor sur-ces to admit of ventilation by means of n bricks or otherwise.

Note.—No provision is made in the Act for ie ventilation between the surface concrete r ground and floor surfaces to the ground oor (having a wooden floor as above) with o basement under.

(e) Every habitable room constructed over stable shall be separated from the stable y a floor which shall have in every part not ccupied by a joist or girder a layer of con-rete pugging of good quality or of other olid construction 3 in. in thickness finished nooth upon the upper surface and properly upported, and the under side of such floor hall be ceiled with lath and plaster of good uality or of other solid construction.

Any staircase or gallery or structure by hich such rooms shall be approached shall e separated from any stable to which it ay adjoin by a brick wall not less than in. in thickness.

Note.—Bricks, tiles, etc., bedded in mortar n be used in place of concrete. Breeze locks 3 in. thick resting on wood fillets ailed to the sides of floor joists fulfils the equirements.

A doorway would be admissible between ie stable and staircase, as openings in this all are not prohibited in the foregoing sub-ection.

The District Surveyor can charge a special e for superintending the construction of ors and partition walls to stables under ection 70, Third Schedule, Part 3.

(f) Nothing in this Act shall affect, alter r repeal any of the provisions of the Public ealth (London) Act, 1891, relating to nderground rooms.

Note.—See Sections 96, 97 and 98 of the ublic Health (London) Act, 1891, 54 and 55 ic., Ch. 76.

(2) This sub-section provides for a penalty or an inhabited room not constructed in onformity with this section.

Section 71. Rules as to party arches over ublic ways:—

(1) Every party arch or party floor, and very arch or floor over any public way, or ny passage leading through or under a uilding or part of a building to premises in ther occupation, shall be formed of brick, one, or other incombustible materials.

(2) If an arch of brick or stone be used it hall be of the thickness of 8½ in. at least, nd the centre of such area shall be higher han the springing at the rate of 1 in. at ast for every foot, and also for any frac-onal part of a foot of span.

(3) If an arch or floor of other incom-ustible material be used it shall be con-ructed in such manner as may be approved y the District Surveyor.

Note.—Steel and concrete filling or rein-orced concrete could be used as an alterna-ive to brick or stone arches. All party oors, i.e., those floors dividing a building nto horizontal sections into or within the ubic capacity allowed must be formed of in-ombustible materials.

Section 72. Rules as to arches under ublic ways:—

(1) Every arch or other construction under ny passage leading to premises in other ccupation, or under any public way or ntended public way, shall be formed of rick, stone, or other incombustible aterials.

(2) If an arch of brick or stone be used it hall.

(a) Where its span does not exceed 10 ft., e of the thickness of 8½ in. at least;

(b) Where its span exceeds 10 but does not exceed 15 ft., be of the thickness of 13 in. at least; and

(c) Where its span exceeds 15 ft., be of such thickness as may be approved by the District Surveyor.

(3) If an arch or other construction of other incombustible material be used it shall be constructed in such manner as may be approved by the District Surveyor.

Note.—The foregoing section provides for the thickness of arches in brick, etc., over vaults under a public way. The retaining walls must be in accordance with the requirements of the local authorities concerned. Under the Metropolis Management Act, 1855, Section 101, as follows:—No vault, arch or cellar shall be made under any street without the consent of the Vestry or District Board of the parish or district in which the same is situate; and all such vaults, arches and cellars hereafter to be made within any parish or district mentioned in either of the Schedules (A) and (B) to this Act shall be substantially made, and so as not to interfere or communicate with any drain or sewer under the control of any Vestry or District Board, or of the Metropolitan Board of Works (now L.C.C.) without their consent respectively first obtained; and if any vault, arch or cellar be made contrary to this provision it shall be lawful for the Vestry or District Board or the L.C.C. to fill up or alter the same, and the expenses incurred thereby shall be paid by the owner of such vault, arch or cellar.

Note.—Under Section 211 of this Act any person who deems himself aggrieved by any order of any Vestry or District Board in relation to the level of any building . . . or to the construction, repair, alteration, stopping or filling up, or demolition of any building, sewer, drain, water-closet, privy, ashpit, or cesspool, may, within seven days after notice of any such order to the occupier of the premises affected thereby, or after such Act, appeal to the L.C.C. against the same; and all such appeals shall stand referred to the committee appointed by such Council for hearing appeals . . .

Section 102. All vaults, arches and cellars made either before or after the commencement of this Act under any street in any parish or district mentioned in either the Schedules A and B to this Act, and all openings into the same in any such street, shall be repaired and kept in proper order by the owners or occupiers of the houses or buildings to which the same respectively belong; and in case any such vault, arch, or cellar be at any time out of repair, it shall be lawful for the vestry . . . to cause the same to be repaired and put in good order and to recover the expenses thereof from such owner in the manner hereinafter provided.

Note.—It has been held that a vestry or district board could not compel the owner of a cellar to repair the flags, which formed the roof of the cellar, and also formed the pavement over which the public passed, Hamilton v. The Vestry of the Parish of St. George, Hanover-square. 29 L. T. 428.

Under the City of London Sewers Act, 1848, consent must be obtained from the City Corporation for the formation of vaults and cellars under streets. Section 125 of this Act corresponds with Section 101 of the Metropolis Management Act, 1855.

The following are the requirements for the construction of vaults in the City of London, and these requirements apply practically to the various London districts.

Vaults.—That the walls and arches be built of good, hard bricks, set in mortar or cement, and that the walls and arches be at least 1½ brick in thickness

That the springing wall be at right angles with, and the ends of the springing walls parallel with, the line of the frontage of the house.

That the top of each arch be at least 15 in. below the surface of the pavement.

That 10 ft., measuring from the front line of the house to the extreme outer point of the brickwork of the end walls, be the greatest projection granted in any street, but that in streets where the footway has not so great a projection as 10 ft., that the external face of the brickwork be only allowed to the line of curb of such footways

That where ovens are constructed beneath vaults they be built entirely independent of the walls and arches, and the surface of the crown of the oven be at least 12 in. beneath the underside of the arches of the vault.

That the openings for coals be as near the house as possible, and be covered with chequered iron plates not less than ¾ in. thick, and not more than 12 in. diameter, or if to give light to the cellars beneath, they be formed of iron frames, with bars and glass lenses.

That the persons constructing vaults pay the expenses of taking up and replacing the pavement.

Note.—Existing vaults under pavement or streets can be replaced with new vaults to the same boundaries, but sanction must be obtained for any new vaults required.

Section 73. Rules as to projections. The following provisions shall (except with the consent of the Council) apply to projections from buildings :—

(1) Every coping cornice string-course fascia window-dressing portico porch balcony verandah balustrade outside landing outside stairs and outside steps and architectural projection or decoration whatsoever and also the eaves barge-boards and cornices to any overhanging roof except the cornices and dressings to the window fronts of shops and except the eaves barge-boards and cornices to detached and semi-detached dwelling-houses and to other dwelling-houses in which the party walls are corbelled out so as to project 4 in. beyond such eaves barge-boards or cornices shall be of brick tile stone artificial stone slate cement or other fireproof material.

For the purpose of this subsection a pair of semi-detached houses shall be deemed to be one building.

Note.—The word fireproof has been used in this section. No definition is given in the Act of fireproof material, and it is evidently intended to be fire-resisting material as in all other sections of the Act.

As a pair of semi-detached houses are treated as one building, and the party wall need not be carried above the roof level (with consent) under this section, the party wall need not be corbelled out to divide the eaves.

In other cases the party walls must be corbelled out 4 in. beyond the eaves, etc., but in terrace houses the general rule is to corbel out flush with the fascia and to allow the iron gutter (if required) to be continuous.

(2) Every balcony cornice or other projection shall be tailed into the wall of the building and weighted or tied down to the satisfaction of the District Surveyor, and no cornice shall exceed in projection 2 ft. 6 in. over the public way.

(3) In a street or way of a width not greater than 30 ft., any shop front may project beyond the external wall of the building to which it belongs to any extent not exceeding 5 in., and any cornice of any shop front may project to any extent not exceeding 13 in., and in any street or way of a width greater than 30 ft., any shop front may project to any extent not exceeding 10 in., and any cornice of any such shop front may project to any extent not exceeding 18 in. beyond the external wall of the building to which it belongs over the ground of the owner of the building provided that this provision shall not authorise in any such street the projection of any part of any such shop front other than the cornice on or over the public way, or any land to be given up to the public way.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—Ed.

Wood Fires.

Sir,—My father has bought a 20-year-old brick house in pine country. His chimney-sweep has, however, already spoilt some of his enjoyment of it by telling him not to burn pine-logs, or any other wood-logs, in the fireplaces. The sweep's explanation is that soot from wood fires is very tenacious and, when the chimneys are cleaned, tends to pull the mortar from the brickwork.

Is this correct? Can it be prevented or counteracted? If not, will the loss of mortar be serious? How can the loss of mortar be remedied?

I should be very grateful if any of your readers could provide answers to these questions.

R. E.

Wood Worm.

[Reply to J. M. May 13.]

Sir,—A good soaking in paraffin is the best cure for wood worm, and I believe that the cure is permanent.

Tried It.

Ventilating Air Space.

[Reply to T. E. S. May 13.]

Sir,—The danger of rot setting up in an unventilated air space under an asphalt flat is less acute than in the damp space under a ground floor, but I consider it is a wise precaution to ventilate such spaces, and have made it a rule in my own work. It is usually possible to insert air bricks between the ends of the roofing joists, and to bore plenty of holes in the neutral axes of the joists themselves, to promote a circulation. In a recent case, it was not possible to work in the air bricks owing to the interposition of an asphalt slope adjoining the flat. In this case I had inserted a number of air inlets standing vertically out of the flat, with the asphalt dressed up round them, and this proved thoroughly efficient.

Practice.

Colouring Cement.

Sir,—I am very anxious to obtain a dark soft grey colour, if possible, in cement, for rough cast and spar dark work; the ordinary colour when dry is not pleasant. Can you tell me of any colouring matter to put in cement which will not destroy the quality, and the usual quantities allowed?

"Baluster" or "Banister"?

Sir,—I noticed in a recent issue of the "Times" an article headed "Metal Banisters," and later on it refers to "the banister of a stair." I wonder whether any of your readers could tell me whether there is such a word as "banister," or if "baluster" is the correct word, as I have failed to find the former in the dictionary?

C. E. H. Clayton.

["Baluster" is correct, though "banister" is frequently used erroneously.—Ed.]

Definition of "Bressumer."

Sir,—I should be glad if any of your readers would give me the correct definition of the word "bressumer." Can this word in a specification be broadened to cover steel girders 40 feet long? Enquirer.

Ventilation of Rooms.

Sir,—I have had a system of central heating, provided by a good heating engineer, handed to me. It provides radiators under the windows of rooms about 10 ft. by 12 ft., at the back of which, and not over 18 in. from the floor, is a 9 in. by 6 in. air brick with flue communicating with the outside air. There is no other means of ventilation; should the window be closed? Is the said air brick sufficient, or should a further ventilator at ceiling level be provided to carry off foul air? The heating is by steam. G.

Specifications.

Sir,—I once built a house for which I wrote specification notes covering four quarto sheets of paper. The preliminary clauses consisted of a statement that the terms of contract were based on those issued by the R.I.B.A., and that all materials and workmanship were to be the best of their respective kinds. Following these I saw no need to discuss loose or dead knots, etc., in timber or the question of slaking lime, since neglect of such things would be a breach of the clause quoted. There also appeared to be no need to elaborate the meaning of P.C. sums, or supplying plant, etc., or a host of other things which go to swell an architect's specification. I had a good builder, and the job was done well and for a low price. I have, however, never had the courage to repeat the experiment, though I am convinced that our redundant and unwieldy documents tend to raise the figure of tenders, besides consuming unnecessary time and material. Have any of your correspondents had experience of the use of a simplified form of specification, and, in particular, have any been let down by such departures? Their experiences would make interesting reading. Architect.

Price of House-building.

Sir,—Can you inform me what is considered a fair price per foot cube for small houses in the Home Counties, for the purpose of estimating? Returned Exile.

Columns and Stanchions.

Sir,—I am anxious to find a formula from which may be calculated the stress at any intermediate point in a loaded column, but am only able to find the formula for the maximum stress in the column. I should be glad to be informed, and also to know the authority for the information.

Student.

Subsidy Houses.

Sir,—In my district the housing subsidy is not given for houses costing more than £600. Is this merely a local rule, or has there been an amendment to the Housing Act? Also, would such a figure include the road and sewer charges on an estate, or, where there is no public sewer, could the cost of the sewage disposal apparatus be deducted from this figure before declaring the cost? Information would be gratefully received.

Builder.

THE WEEK IN PARLIAMENT.

Westminster, *Wednesday.*

Mercantile Marine Memorial.

The Mercantile Marine Memorial Bill has been read a second time in the House of Lords.

Houses of Parliament—Repairs.

Sir Basil Peto asked the Under Secretary of State for the Home Department, as representing the First Commissioner of Works, whether his attention had been drawn to the considered opinion of the London Association of Master Masons on the proposed patching and gradual repair of the Houses of Parliament with Stancliffe stone; and whether, as this opinion was adverse to the present proposal to the Office of Works, he would consider the appointment of an expert committee to reconsider the whole question, including the advisability and ultimate economy of the proposal entirely to re-face the building with Portland stone.

Captain Hacking said that the First Commissioner was aware of the views of the master masons regarding the proposal to repair the stonework at the Houses of Parliament with Stancliffe stone. He did not consider it necessary to appoint an expert committee, but before reaching a final decisio he was seeking the advice of representati architects, builders, and masons, both in Lo don and in the provinces.

Building Materials.

Mr. Lumley asked the Minister of Heal whether he would consider the possibility requiring a clause to be inserted in the ho ing contracts made by local authorities wi building contractors that where possible bui ing materials should be purchased in t country.

Mr. Chamberlain said that section 10 the Housing (Financial Provisions) A 1924, provided that, in approving propos for the construction of houses, the Minis of Health should not impose any conditio which would prevent the materials requi being purchased in the cheapest market home or abroad. The Government had, ho ever, urged local authorities to arrange t all contracts for or incidental to works carri out by them should, in the absence of spec circumstances, be placed in this country.

Rent Restriction.

Mr. Looker asked the Minister of Hea whether, when reviewing the operation of Rent Restrictions Act, he would consider question of enabling persons who had bou houses for their own occupation, but w unable to get possession of them, to obt such possession in spite of any provisions that Act he might think it desirable to c tinue.

Mr. Chamberlain said the suggestion wo be carefully considered by the Governm before a decision was arrived at in reg to the future of the Rent Restriction Acts

Housing Progress in Yorkshire.

Mr. Chamberlain informed Mr. Lunn t 19,471 houses were completed during year ended December 31, 1926, in the W Riding of Yorkshire (including the areas County Boroughs in the Riding) with the of subsidy under the Housing Acts, and the 1st inst., 13,653 were under constructi

Joinery Imports.

Sir P. Cunliffe-Lister informed Mr. Lun that the value of imports in recent years builders' woodwork (window frames, doo etc.), and of the corresponding imports years immediately preceding the war:—

Period.	Declared Valu of Imports.
Annual average.	£
1911-1913	169,000
1922	235,000
1923	377,000
1924	706,000
1925	1,087,000
1926	1,430,000

The official description of the imports wh value for 1911-1913 was shown above "House Frames, Fittings, and Joine Work."

Builder's Estate.

Mr. Thomas Rowbotham, of Gilbertsto South Yardley, Warwick, founder Thomas Rowbotham, builders and contr tors, Coventry-road, Birmingham, and London, left estate of the value of £239,1

Widening of South Road.

A scheme is before the Middlesex Cou Council for widening the Bath-road throu Heston, Isleworth, and Staines for a d tance of three miles at an estimated cost £145,000. The acquisition of the Berke Arms Hotel and a number of cottages a bungalows will be a necessary prelimin to the work. A highway 100 feet wide proposed, with a 40 ft. carriage way for present with grass margins, and 6 ft. w footpaths. The improvement will begin the junction with the Great West-road a end at the beginning of the Colnbrook pass. It is understood that the work n be commenced next year.

THE BUILDING TRADE

THE LANDLORD AND TENANT (No. 2) BILL, PART I.

We have before us the text of the Bill which, to quote the preamble, provides "for the payment of compensation for improvements and goodwill to tenants of premises used for business purposes, or the grant of a new lease in lieu thereof, and to amend the law of landlord and tenant." There are three parts to the Bill. Part I deals with compensation for improvements and goodwill, Part II contains general amendments of the law of landlord and tenant, whilst Part III. is entitled "General," but contains the provisions constituting the tribunal for the purposes of this Bill. Most of the operative clauses in Part I of the Bill commence with the expression. "Subject to the provisions of this Part of the Act a tenant of a holding to which this Part of the Act applies," so it is necessary in the first place to ascertain to what holdings this Part of the Act applies. This is laid down in Clause 12, Sub-clause (1), "The holdings to which this Part of the Act applies are any premises held under a lease, made whether before or after the commencement of this Act" (30th September, 1927. See Clause 20, Sub-clause (2)) "and used wholly or partly for carrying on thereat any trade or business, and not being agricultural holdings within the meaning of the Agricultural Holdings Act, 1923."

In Part III of the Bill there is a general interpretation clause containing a definition of the word "tenant," which includes yearly tenants (see Clause 19), but to avoid misapprehension we may point out this definition appears not to apply to Part I of the Bill owing to the express wording of the clauses, as the general interpretation clause commences with the words "For the purpose of this Act unless the context otherwise requires." The expression "lease" is also defined as meaning "a lease, under-lease, assignment operating as a lease or under-lease, or an agreement for such lease, under-lease, or assignment." In Clause 12, Sub-clause (2), some indication is given as to what are to be deemed business premises as it provides "For the purposes of this section premises shall not be deemed to be premises used for carrying on thereat a trade or business."

(a) By reason of their being used for the purpose of carrying on thereat any profession;

(b) By reason that the tenant thereof carries on the business of sub-letting the premises as residential flats, whether or not the provision of meals or any other service for the occupants of the flats is undertaken by the tenant."

The letting of apartment houses is clearly not within this exception, a class of business to which the element of goodwill often attaches.

Sub-clause (3) provides "In the case of premises used partly for purposes of a trade or business and partly for other purposes this Part of the Act shall apply to improvements only if and so far as they are improvements in relation to the trade or business.

Compensation for Improvements.

Returning to Clause 1, Sub-clause (1), it provides, "Subject to the provisions of this Part of this Act a tenant of a holding to which this Part of this Act applies shall, if a claim for the purpose is made in the prescribed manner" (that is, as prescribed by regulations made by the Reference Committee) (see Clause 19), "not more than six nor less than three months before the determination of the tenancy, be entitled at the termination of the tenancy, on quitting his holding, to be paid by his landlord compensation in respect of any improvement on his holding made by him or his predecessors in title which at the termination of the tenancy adds to the letting value of the holding."

By a proviso to this clause it is laid down that the sum paid as compensation for any improvement (a) shall not exceed the capitalised value of the net addition to the letting value of the holding as a whole which may be determined to be the direct result of the improvement, nor shall it exceed (b) the reasonable cost of carrying out the improvement at the termination of the tenancy, subject to a deduction of an amount equal to the cost (if any) of putting the works constituting the improvement into a reasonable state of repair.

By Sub-clause (2) in determining the capitalised value of such net addition regard shall be had to the purposes for which it is intended the premises shall be used after the termination of the tenancy, and if it is shown that it is intended to demolish the building or to use the premises for a different purpose, and that in consequence the improvement will not add to the letting value of the premises, regard shall be had to the length of time likely to elapse between the termination of the tenancy or change of user.

By Sub-clause (3) all questions as to the right of compensation and the amount thereof are to be determined by the tribunal created by the Bill (see Clause 16), and it is provided that if on account of an intention to demolish or change the user the tribunal has awarded no compensation or a reduced amount of compensation, the tribunal may authorise a further application for compensation if effect is not given to the intention within a time to be fixed by the tribunal.

Clause 2, Sub-clause (1), provides that a tenant shall not be entitled to compensation under this part of the Bill (a) in respect of any improvement made before its commencement as an Act, or (b) in respect of an improvement which the tenant was under an obligation to make in pursuance of a contract entered into for valuable consideration including a building lease.

Sub-clause (2) provides that the tribunal, in determining the compensation for an improvement, shall, in reduction of the tenant's claim, take into consideration any benefits which the tenant may have received from the landlord in consideration expressly or impliedly, of the improvement.

Having regard to the above complicated considerations which may arise in connection with ascertaining the value of improvements, a landlord might well turn a deaf ear to any suggestions made by his tenant as to improvements, but under the following Clause 3 it will be seen the landlord is not a free agent, if we may use the expression, as to improvements on his own property, and in addition to this, Clause 7 is directed to prohibiting contracting out.

Clause 3, Sub-clause (1) provides that where a tenant of a holding to which this Part applies proposes to make an improvement he shall serve notice of his intention on the landlord, together with a specification and plan of the proposed improvement, and then if the landlord, within three months of such notice, serves on the tenant a notice of objection, the tenant may in the prescribed manner (that is, under rules to be made by the tribunal, see Section 16 (2) "apply to the tribunal, and the tribunal may, if satisfied that the improvement is of such a nature as to be calculated to add to the letting value of the holding at the termination of the tenancy, and is reasonable and suitable to the character thereof, and will not diminish the value of any other property belonging to the same landlord, or any superior landlord from whom the immediate landlord of the tenant directly or indirectly holds, and after making such modifications (if any) in the specification or plan as the tribunal thinks fit, certify in the prescribed manner that the improvement is a proper improvement." When such an improvement is thus certified, or if no notice of objection has been given within the prescribed time by the landlord, the tenant can execute the improvement notwithstanding anything to the contrary in the lease. (See Sub-clause (2).)

The only way that a landlord can get out of this clause is by showing that he himself has offered to execute the improvement in consideration of a reasonable increase of rent, but apparently then, the tribunal is to determine whether the rent is reasonable (see Proviso to Sub-section (1)), but this is not absolutely clear. The proviso is as follows: "Provided that if the landlord proves that he has offered to execute the improvement himself in consideration of a reasonable increase of rent, the tribunal shall not give a certificate under this section unless it is subsequently shown to the satisfaction of the tribunal that the landlord has failed to carry out his undertaking."

It will be seen that this clause is very drastic; not only has the landlord to find the money representing the capitalised value of the net addition to the letting value, at the termination of the lease, but he is allowed no volition at all whether despite this liability the improvement shall be effected; further it raises questions between the landlord and his superior landlord and adds a serious liability to property owning. In this latter connection it may be convenient here at once to refer to Clause 6, which provides "Where in the case of any holding there are several persons standing in the relation to each other of landlord and tenant, the following provisions shall apply:—Any mesne landlord who has paid, or is liable to pay compensation under this part of this Act shall, at the end of his term, be entitled to compensation from his immediate landlord in like manner, and on the same conditions as if he had himself made the improvement, or created the goodwill in question, except that it shall be sufficient if the claim for compensation is made at least two months before the expiration of his term."

The clause further provides: "A mesne landlord shall not be entitled to make a claim under this section unless he has within the time, and in the manner prescribed, served on his immediate superior landlord copies of all documents relating to the proposed improvements or claims which have been sent to him in pursuance of this part of the Bill." It is important to note that although a mesne landlord can claim as against his superior landlord up to two months before the termination of his term, this latter provision as to sending the superior landlord copies of all documents served upon the mesne landlord within a time to be prescribed by rules made by the tribunal is very important, for under the concluding paragraph of Clause 6 the superior landlord may intervene in the proceedings between the mesne landlord and his tenant, for this purpose, the same powers being conferred upon him by the Bill as are conferred upon the mesne landlord.

(*To be continued.*)

THE LAW OF FIXTURES.—V.

By W. T. CRESWELL, Barrister-at-Law; L.R.I.B.A.; Associate (late Fellow) of the Surveyors' Institution; &c.

Contracts in Respect to Fixtures.

When any dispute arises between parties concerning fixtures, the usefulness of a contract defining and controlling their ownership and liabilities becomes evident, more especially when no such contract exists. The tenant's right to remove tenant's fixtures is subject to any contract made between the landlord and himself. If he has covenanted to yield up the demised premises "together with all fixtures," the word "fixtures" may be construed as including both trade and tenant's fixtures. Custom may also be pleaded as extending or regulating the right of removal.

If the landlord desires to restrict the ordinary right to remove trade and tenant's fixtures, this must be expressed in the contract in plain language; or, if the language is ambiguous, then the ordinary rights of the tenant as to removal of fixtures are not affected thereby.

Further, the *ejusdem generis* rule already referred to in Article III will be applied; and if in the covenant the articles particularly enumerated belong to one *genus* only, such as landlord's fixtures, general words which follow the covenant must be construed as applying only to things of that *genus*. Disputes concerning any articles not belonging to that *genus* would be controlled by ordinary law and custom.

In Bishop *v.* Elliott (1855), 11 Ex. 113, the lessee by a covenant in the lease was bound to deliver up the premises to the lessor, together with "all locks, keys, bars, bolts, marble and other chimney pieces, foot-paces, slabs and other fixtures, and articles in the nature of fixtures, which should at any time during the term be fixed or fastened to the premises or be thereto belonging." At the date of the lease the house was intended to be used as a tavern, and was, in fact, completed as such by the lessees, who put in and fixed to the premises, fixtures of the description known as trade and tenant's fixtures. It was held that the words of the covenant only referred to such fixtures as those with which they are classed and commonly called landlords' fixtures, and that the lessees were therefore not restrained from selling either the trade or tenants' fixtures. Again, in Lambourn *v.* McLellan (1903), 2 Ch. 268, in which the previous case was followed, the lessee covenanted to yield up the demised premises together with all doors, locks, keys, etc., wainscots, hearths, stoves, marble and other chimney-pieces, etc., "and all erections, buildings, improvements, fixtures, and things which are now or which at any time during the said term hereby granted shall be fixed, fastened, or belong to" the demised premises. The word "machinery" did not occur in the covenant. The lessee placed in the premises various machines fastened to the floor or walls by screws or nails; and then, he having become bankrupt, the trustee in bankruptcy desired to sell the machines separately from the premises. It was held that the general words in the above covenant must be construed as applying only to things *ejusdem generis* as those described in the particular enumeration, which were of the nature of "landlord's fixtures," and the lessee was not deprived of his ordinary right to remove trade fixtures, such as the machinery in question, and that consequently the trustee in bankruptcy was entitled to sell the machinery.

But the specific words of a covenant are never assignable to one *genus*, and general words cannot be restricted in their application if no assignable *genus* can be found in the covenant to which the articles enumerated belong. In Wilson *v.* Whateley (1860), 1 John & H., 436 a lease contained a covenant to yield up certain scheduled articles, together with all doors, wainscots, shelves, presses, dressers, drawers, locks, keys, bolts, bars, staples, hinges, hearths, chimney-pieces, mantelpieces, chimney-jambs, foot-paces, slabs, covings, window shutters, partitions, sinks, water closets, cisterns, pumps and rails, water tanks, "and other additions, improvements, fixtures and things," which were and should be any ways fixed or fastened upon the premises. It was held that the lessee could *not* claim a marketable title even to articles in the nature of tenants' fixtures.

If, therefore, reference is made in a lease to fixtures, great care should be taken to clearly define, *genus* by *genus*, what articles are included in the tenancy.

Fixtures under a Licence.

Although, as a general rule, tenants' fixtures, when removable, must be removed before the termination of the tenancy, a landlord may by a special agreement (either in a clause in the original lease or at any later time) authorise the tenant to remove them after the termination of the term; and such agreement or licence will be binding and enforceable. But in order to make it operative as against third parties—as, for instance, against a succeeding tenant—the agreement or licence must be under seal, because all transfer of interest in land must be by deed, *i.e.*, in writing, signed, sealed and delivered; and immediately the tenant's term is ended, all annexed fixtures become part of the soil, even if they are there by parol consent of the landlord.

In Roffey *v.* Henderson (1851), 17 Q.B. 574, the plaintiff had annexed certain articles removable, according to their kind, by him during the term of his lease. On its determination he requested the landlord to purchase them, or to let them remain for possible purchase by the incoming tenant. The landlord wrote declining to purchase, but added, "I have no objection to you leaving them on the premises and making the best terms you can with the incoming tenant." The articles remained, and on the new tenant entering and also declining to purchase them, plaintiff demanded liberty to enter and remove them; he was refused permission by the then tenant, whereupon he (plaintiff) brought an action against them for hindrance and trover (*i.e.*, a form of action to recover damages from one who has converted another's goods to his own use). It was held that the landlord's letter was a mere licence to take away the articles; but, not being under seal, it was not a valid grant of such privilege against the new tenant in possession, who was not a party to the licence; and that trover did not lie because the articles were unsevered from the freehold.

Parol Agreement

Where, however, a landlord entered into a parol agreement to buy fixtures which were removable by the tenant, it was held, that not involving an interest in land, this parol agreement was enforceable, and that such consent might give a right of action for the value of the fixtures against the lessor if he subsequently refused to pay for them or to permit their removal; though it would give no such right as against the lessor's mortgagees in possession, who were no parties to the agreement, should they refuse to allow their removal.

Thomas *v.* Jennings (1896), 66 L.J.Q.B. 5, was a case similar to the last. Here the landlord, by a parol agreement, gave an extension of time for removal of tenant's fixtures; and in addition, permission to sever and remove them (after, as before explained, they had become part of the freehold owing to non-removal during the term) The landlord subsequently refused to permit their severance and removal; and it was held that this gave the tenant a right of action against him for the value of the fixtures; but did not give any such right to the tenant against the landlord's mortgagees who had entered in the meantime into possession under a mortgage deed. Hawkins, J., said: "If the contract found by the jury was sought to be treated as a grant of a licence to enter upon the premises at a future time and to sever the fixtures from the freehold, it would be invalid as not being in writing and under seal."

Covenants in Respect to Fixtures.

The expression "to repair and to yield up in repair" extends to all fixtures both landlord's and tenant's.

A tenant may sever any fixtures during his term and sell them; but if he replaces them before the end of the term, this is no breach of the covenant "to repair and uphold the demised premises, and to deliver up the same at the end of the term, together with all things affixed thereto." (See Doe & Burrell *v.* Davies, 1851, 16 L.T.O.S. 389).

It has been stated that tenants' fixtures do not regain their nature of chattels until such times as they are severed from the freehold, and that during the continuancy of the tenancy; but the lessor and lessee may, without taking away the tenant's ordinary rights, enter into an agreement by which the lessor, in certain events, may re-enter and claim a right to fixtures; as, for instance, where there is an execution made against the lessee or on his becoming bankrupt.

In Dumergue *v.* Rumsay (1853), 2 H. & C. 777, there was an agreement for a lease of a music-hall in which the lessee covenanted to deliver up the music-hall, together with all locks, doors and other fixtures, and that none of the fixtures should be removed during the term except for purposes of repair; and also that, in case the term should be determined by effluxion of time, it should be lawful for the lessee to remove the fixtures within twenty-one days after the expiration of the term. But if the tenant became bankrupt or insolvent or if any distress or execution should be levied or executed by seizure on the premises then the lessor could re-enter and seize and retain all the fixtures, both tenant's and trade fixtures. The lessee during the term put up some tenant's fixtures and they were seized by the sheriff under a writ of *fi fa* (*i.e.*, a judicial writ of execution whereby one who has recovered judgment for any debt or damages may obtain the personal property of the judgment debtor), whereupon the lessor claimed the fixtures. It was held that by the agreement the lessee had renounced the ordinary tenant's right of removal of the fixtures during the term, and that the sheriff had no right to take the tenant's fixtures in execution.

THE TRADE UNIONS AND TRADE DISPUTES BILL IN COMMITTEE.

The Government inserted drastic amendments in Clause 1 of the Trade Unions and Trade Disputes Bill in Committee in order to meet points that had been raised in connection with the Bill as drawn. This clause (Subclause (1)) now reads: "It is hereby declared that any strike is illegal if it has any object other than or in addition to the furtherance of a trade dispute within the trade or industry in which the strikers are engaged and is a strike designed or calculated to coerce the Government either directly or by inflicting hardship upon the community; and it is further declared that it is illegal to commence or continue or to apply any sums in furtherance or support of any such illegal strike. (The Attorney-General intimated in the course of debate that supporting wives and children would not be supporting a strike.)

A lock-out is dealt with in similar terms.

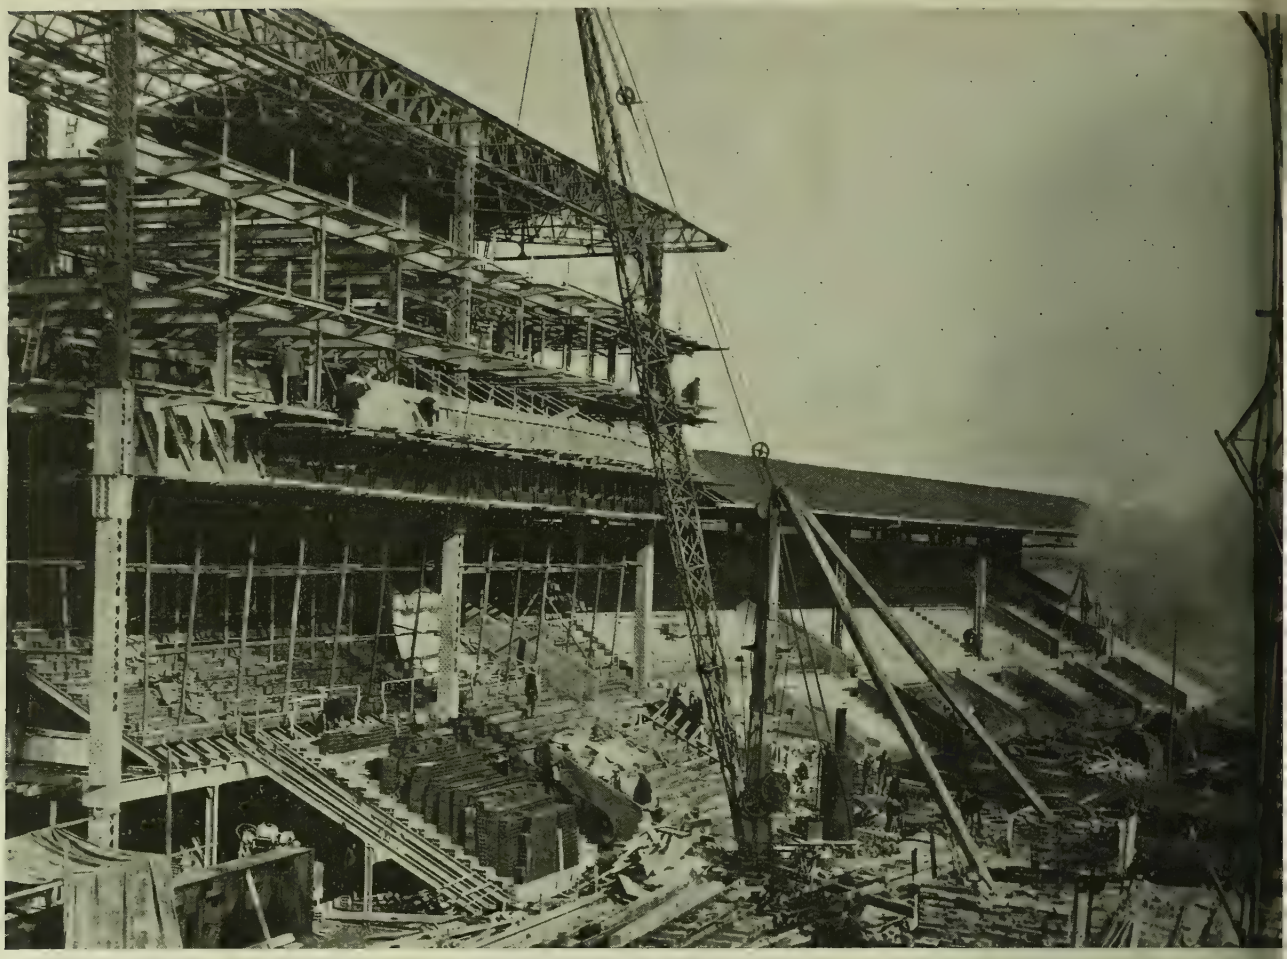
The sub-clause then continues as in the Bill as originally drafted:—

"For the purposes of the foregoing provisions a trade dispute shall not be deemed to be within a trade or industry unless it is a dispute between employers and workmen or between workmen and workmen in that trade or industry which is connected with the employment or non-employment or the terms of

employment or with the conditions of
ur of persons in that trade or industry.
also sub-clause below.) Sub-clause (2) has
amended and now reads : " If any per-
declares instigates incites others to take
in, or otherwise acts in furtherance of
rike or lockout declared by this Act to
llegal he shall be liable on summary con-
ion to a fine not exceeding £10 or to im-
onment for a term not exceeding three
ths or on conviction on indictment to
risonment for a term not exceeding two
rs. Provided that no person shall be
med to have committed an offence under
section or at common law by reason only
is having ceased work or refused to con-
ue to work or to accept employment."
Without prejudice to the generality of
expression 'trade or industry' workmen
ll be deemed to be within the same trade
industry if their wages or conditions of
loyment are determined in accordance
h the conclusions of the same industrial
ncil, conciliation board or other similar
y or in accordance with agreement made
h the same employer or group of em-
yers."
ub clause (3) remains as it was except
the introduction of a lock-out into its
visions.
he most important of the amendments,
will be seen, were the inclusion of lock-
s, the abandonment of the word " intimi-
e," and the expression " any substantial
tion " of the community, and the explana-
n of what is to be deemed " the same
de and industry," and not least the
lification of Sub-clause (2) by the provision
t no person shall be deemed guilty of the
nce of inciting others to take part or
erwise acting in furtherance of an illegal
ke or lock-out, merely by reason of his
ing ceased work or refused to continue
work or to accept employment.
As regards the sympathetic strike, it is now
ar that some sympathetic strikes will be
gal whilst others are not. The Attorney-
neral put the matter thus : (1) a strike
the industry itself is not touched by the
l even if it is in an essential industry
l might coerce the Government by inflict-
hardship on the community; (2) a sympa-
tic strike if it is aimed at the *employer*
not touched by the Bill, but if it is aimed
the *Government* it is illegal.
To make a strike illegal it is important to
nember that the *two* conditions laid down
the sub-section have to be fulfilled; its
ject must be other than the furtherance
a trade dispute within the industry as
fined in the Bill *and* designed to coerce
e Government either directly or by inflict-
hardship on the community. The proviso
Sub-clause (2) as to persons withholding
eir labour may at first sight appear to lend
elf to passive resistance, but such will not
the case, for if passive resistance were
ganised the organisers would fall within the
b-section. It will be seen the Government
s gone a long way to meet any serious ob-
tions raised against this clause as drawn.
Clause 2, which relates to the protection of
rsons refusing to take part in illegal strikes,
so passed through Committee with some
nor amendments. In Sub-clause (1) the
ly alteration was that the sub-clause covers
e legal personal representatives of the
rkman or person subjected to deprivation
benefits or expulsion from the union, and
k-outs are included.
In Sub-clause (2), for the words " requiring
e reference of disputes to arbitration " is
bstituted " requiring the settlement of dis-
tes in any manner " ; whilst Sub-clause (3)
redrafted as follows :—" As respects any
ike or lock-out before the passing of this
t, but since the 1st day of May, 1926,
hich according to the law as declared by
is Act was illegal this section shall have
fect as if it had been in operation when
e strike or lock-out took place."
The main effect of the amendment is the
sertion of the above date for as the Bill
as originally drawn the provision was retro-
ective without limitation.

AMERICAN BUILDING METHODS

THE teachers of building in the technical schools in the North of England, at their meeting at Ilkley a few days ago, discussed the relative advantages of American and British methods of building organisation. During the day they paid a visit to a large country mansion that is now being built from the designs of Sir Edward Lutyens. Mr. W. R. Davis, of the Board of Education, spoke, as well as headmasters of North of England technical schools.



Mr. A. C. Bossom, F.R.I.B.A., opened a discussion on American methods. He did not advocate these methods as applicable to this country, but endeavoured to show the value of organisation. In practically all cases in the United States and Canada when the estimate was submitted an estimate of time was also required, which was of great monetary value, particularly on commercial work, as it lessened the interest to be paid on the money invested and caused the income that the property produces to develop so much quicker.

It was usual to request the contractor to submit, for the owner's and the architect's approval, a definite progress schedule outlining the time when all the various tradesmen on the building would commence their work, when they would finish their work, when the materials had to be purchased so as to enable this schedule to be followed, etc., and from this a judgment was made as to whether the contractor's estimate of progress was possible of maintenance. Once it had been decided that the estimate of time was satisfactory, the contractor also was often requested to submit a list of his sub-contractors with their detailed estimates, so the owner might know who was going to do his work, when these people would start, when they must finish, and how much they were going to be paid for it, which information was obviously of tremendous value in connection with the payment of the architect's certificates throughout the entire building operations. The full-time schedule showed the latest date when the builder must receive his completed information for each of the various trades throughout the building, the latest date upon which he must purchase the various materials, the time when each sub-contractor should start on the building, and the time when each must finish. The successful contractors had made it a rule to let their sub-contracts as early in the job as possible, and it had been found that once a general contractor had definitely received the general contract from the owner, he frequently could cut down the original sub-estimates he received by a substantial amount, for as there was so much work being estimated in America it was a recognised fact that many of these sub-contractors did not go into the question of giving their very lowest possible estimate until they were sure that the one they were giving it to actually possessed the general contract himself.

Having received the drawings, etc., from the architect, and the sub-contracts being let, the general contractor started following his sub-contractors to obtain their shop or setting drawings, as these, of course, must all be checked in the builder's office, submitted to the architect and approved in his office and returned again to the sub-contractor in ample time to enable them to get the work in hand. Every week or two, a definite report on the progress of the sub-contracted material that was being fabricated away from the site had to be sent to the general contractor recording the actual progress that had been made in all these details, stone cutting, steel, etc., and by a very simple charting process it was evident whether there was a likelihood of the sub-contractor having the material ready to ship in time so as to reach the building when needed. If it was apparent that things were not progressing as they should, the sub-contractor was requested to put more men on to it, or to get more speed on, and if this did not get results, an inspector was usually sent to find out what was the trouble.

When the work was ready to be shipped, notification was sent to the general contractor, so that he might know that the material was in transit. If it was needed in great haste, it was not unusual to send out a number of expediters, as they were called, who actually rode with the material in question so as to prevent it being delayed. They prevented the trucks being put into sidings and forgotten, or diverted from the straight-away run that was desired to bring it to its destination on time. In the interval the contractor had figured out where he could get necessary storage space for receiving the material, how the same could be sorted, and how stacked when it arrived, so that it did not require double and treble handling, and to enable it to be readily available as needed. He had also figured out approximately how many men the various sub-contractors would need to have on the job to live up to their time of completion, where they could put their own shanties, etc. Every week or so, once building was commenced, the architect sent a senior representative, the builder had a representative, and each sub-contractor had to have a representative at a round-table meeting of the building, and everybody was requested at that meeting, in front of all the others, to state definitely the condition of their work; were they ahead of their schedule? were they behind it? were they delayed, and if so, why? was some other tradesman in the way? If there was no reason for delay, the responsible party was censured, and if there was a reason, it was remedied at once to enable the work to proceed, and minutes were kept of these meetings. A written report was made at least once a month on these lines by every sub-contractor on the building, and this was sent in, as a rule, in triplicate by the general contractor, to the architect and the owner, so that all could see in advance, in fact, months ahead, where troubles were liable to develop, what was essential to avoid these troubles, and what advantages might be gained by looking after difficulties which were not obvious before the work started. Requests for payment by the various sub-contractors and by the general contractor were all checked up in relation to these reports, and little was left to chance, any more than was bound to be the case where matters were being handled by normal human beings. The American contractors were often not as good builders as were our people—in fact, they were literally organisers in most cases, but they *did* make it a matter of the utmost importance that they should be fully informed of all conditions on their buildings in advance of the time, when lack of such knowledge was liable to cause trouble. There was a decided air of friendship, almost camaraderie, around American building operations.

He believed it was an indisputable fact that Union regulations in America did allow a man to do rather more than was customary here, and in this connection, in certain places where unions were not very powerful a certain amount of pace-making was still undertaken, and on many jobs the sub-contractors as well as the general contractors received bonuses for getting their work finished ahead of time; but they all set out to build up reputations for speed, which carried weight on commercial undertakings. The Americans had not discovered any wonderful secret of how to build quickly. They had not achieved anything wonderful in the way of marvellous craftsmanship; but by following the methods outlined they were able to avoid so many of those delays which had, unfortunately, become common in England, but which were totally avoidable. These methods enable the mechanic to earn his pay on each job in much less time, for he usually got a full week's work every week he was on the job; and it also enabled the contractor to get his profit in the shortest possible time, and the owner to get his building so much quicker.

(For rates of wages in the Building Trade in Scotland, see page 873.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING. ETC.

May 30.—**Aylesbury.**—Decorations.—Decoration etc., of 44 houses at Southcourt, for T.C. Wm. Harold Taylor, B.E. and S., Town Hall

War Memorial.

The Royal Army Medical Corps memorial window in Westminster Abbey to commemorate over 7,000 officers, warrant officers, non-commissioned officers, and men of the corps who fell in the war, has now been dedicated; the window is on the north side of the nave and overlooks the grave of the Unknown Warrior. The window, in stained glass, completes the corps' gift to the Abbey in memory of fallen comrades, whose names are enrolled in a book preserved in the Chapter House. It is the earliest of the Abbey series of windows of Kings and Abbots. In the left-hand light is the figure of Edward the Confessor, from the wrist of whose right hand hang tablets inscribed with the opening words of the King's Charter to the Abbey. The figure of Abbot Edwin, who died in 1071, is in the right-hand light. Beneath, between the Royal Arms and the Union Jack, are the badge and motto of the corps, and the names of the principal battlefronts in which it served in the war. The window was designed and carried out by Mr. J. N. Comper.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. TRADE NEWS

Northern Ireland Parliament Buildings, Belfast.

reference to the illustrations of this ing, which were given in a recent issue, re informed that the Truscon floor will sed throughout.

Royal Society of Arts New Facade.

are informed that "Atlas White" and cement was used for this new e, which we illustrated in our last issue. ston Webb and Son were the architects.

The Royal Lift, New Stands, som Race Course, (*See p.* 859.)

THE SCOTTISH BUILDER

SCOTTISH HOUSING

Sir J. Gilmour informed Mr. Taylor that the number of subsidised houses built in Scotland each year since the war was as follows:—

Year.	No. of Houses.
1919	Nil
1920	692
1921	5,816
1922	10,505
1923	6,618
1924	4,384
1925	8,201
1926	13,592

According to returns made by local authorities, the number of non-subsidised houses built was as follows:—

Year.	No. of Houses. Approximately
1919 1920 1921 1922 1923	5,000*
1924	1,553
1925	1,852
1926	1,812

* These returns were not instituted until 1924, and information for the previous years is incomplete.

Scottish-American War Memorial.

The work on the foundations of the Scottish-American War Memorial in Princes-street Gardens, Edinburgh, has been begun. At present the work is confined to excavating the bank below the upper terrace to allow a retaining wall to be constructed. This work is being supervised by Messrs. Fairlie, Reid and Forbes, who are acting as agents for the sculptor, Dr. R. Tait M'Kenzie, LL.D., of Philadelphia. The site is being prepared about 30 yards from the bandstand in the West Gardens, opposite a point about midway between Frederick-street and Castle-street, and it is hoped that it will be erected about the end of July.

NEW BUILDINGS IN SCOTLAND

Aberdeen.—HOUSES.—51.18 acres of the Hilton Estate has been acquired by the Town Council, at a cost of £15,568, for the purpose of erecting houses.

Greenock.—HOUSES.—At Dean of Guild Court plans by Corporation for the erection of 164 houses in the Bow Farm area were passed. The houses are of the flatted type, and are of three apartments with scullery and bathroom. Linings were also granted to the Corporation for six tenements comprising 56 two-apartment houses with scullery and bathroom, to be erected in the Glasgow-road.

Musselburgh.—HOUSING.—The Town Council has feued 3½ acres at £12 10s. per acre from the Earl of Wemyss for the purpose of erecting another 52 houses in connection with the burgh housing scheme at Monktonhall.

Paisley.—HOUSES.—Paisley Dean of Guild Court has granted a lining presented on behalf of the Town Council for the erection at Lochfield of 126 houses.

Gifts for the Fine Arts.

Mr. Robert Brough, of St. John-street, Perth, and Ochilview, Bridge of Earn, Perthshire, left £67,074. Bequests included £5,000 for the promotion of the fine arts in Perth. The residue of the property is given to the City of Perth, to be applied for the promotion and encouragement of the fine arts, painting, engraving, and sculpture, with power to expend it in acquiring heritable property and in building.

Scottish Certified Carpenters.

A general meeting of the Scottish section of the Incorporated British Institute of Certified Carpenters was held in Edinburgh. By kind permission of the architects, Messrs. Auldjo Jamieson and Arnott, FF.R.I.B.A., 13, Young Street, Edinburgh, the section visited the new Astley Ainslie Institution, and were conducted over the various buildings by the clerk of works.

BUILDING TRADE WAGES IN SCOTLAND.*

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

Vol. CXXXII. No. 4,400. JUNE 3, 1927.

THE GENEVA COMPETITION

IT is perhaps typical of the slight impression which architecture makes upon the lay mind that, whereas the average man in the street has some, if a little hazy, conception of the avowed purpose of the League of Nations, very few had realised that a great effort as being made to express this tremendous purpose into chitectural terms until a curt notice in the daily Press timated that such an effort had indeed been made, and that om the wealth of world talent, no man had risen to the casion, and no British architect had proved worthy even mention. These are the bald terms which have impressed emselves upon the reader of casual news, as he has glanced wn the columns at the breakfast table, or in the train. e may have folded up the paper with a passing feeling that chitects as a class are a poor lot, poorer, in fact, than he ready imagined, and that the fact is of small consequence. ad the importance of the competition been impressed on him from the outset, and had he spent some thought on its scope and significance, the appearance of the result uld have fallen more naturally into its correct and relative sition, and would have indicated an event less easily passed t of mind if more thoroughly comprehended.

We have consistently set our face against the policy of ticising competition awards, and have done so only where apparently serious error of judgment has been made, d in this Geneva case it would be impossible to criticise elligently without having viewed the range of designs sub-tted. The point is mentioned in order to make clear at the object of this comment is to clear the air, and to ve some definition to the aims of the competition and the aning of the present apparent impasse.

Opinions may vary widely as to the practical application the ideals of the League of Nations, and to discuss the litical considerations of a matter of this kind is outside the per scope of a technical journal. The fact remains, wever, that this country, among others, is definitely com-tted to a policy which has for its aim the leaguing together all the nations of Europe, and ultimately of all the nations the world, against the calamity of war. Nations have od shoulder to shoulder against a common enemy before w, but such alliances have been for defence or attack inst a material enemy, and not against an abstract idea defence of an ideal. The ideal is at the same time splendid d stupendous. To interpret its spirit in terms of archi-ture is a task equally splendid and stupendous, and we nture to assert that the fact that from the thousands of signs submitted, not one has been considered sufficiently olime to be worthy of realisation, is less a slur upon the lities of the competitors, than a tribute to the sincerity of assessors.

The task of expressing in one building something to which h of a great and diverse number of nations might claim ne blood relationship; to mark the absolute "newness" of idea underlying the scheme, and its greatness; to stamp with the mark of the age from which it has sprung, while serving some traditional stability, is indeed a tremendous . Never before in the history of the world has the architect n faced with a parallel problem, and it is small wonder t the man who is equal to it has yet to be found. The ernational Jury of Architects may be congratulated on ir courage in insisting upon perfection.

The absence of British names from the list of prize-winners is also open to misunderstanding, and yet one must view it as a very natural outcome. Nature has given to our nation an insular position, which reflects itself in our daily life and in our arts. Is it remarkable that the British architect should find it more difficult than his European neighbours to find adequate expression for the aspirations of a number of nations divided by more or less arbitrary frontiers, and subject to considerable interpenetration? Does he not also start with a distinct handicap in his chances of finding sympathy for his outlook from an International Jury? Much as we would like to see one of our own countrymen successful, we must confess that such an event would be remarkable, while refusing to admit, of course, the impossibility of such a happening

It is not possible or desirable to forecast the next step that will be taken out of a choice of courses. The promotion of a limited competition among invited competitors from the originals is a possible and reasonable outcome. In such a case, the present designs would no doubt be exhibited, and fresh ideas of an international character might be thus at the disposal of the fresh competitors. A fuller appreciation of the spirit of the building might also be expected. It is, however, possible that the present result may be taken as indicating that the competition system has failed to achieve the desired object, and must therefore be shelved in future policy. A number of courses would still be available. The design might be entrusted to a panel of architects, chosen either from the ranks of the previous competitors or as eminent men elected each by his own nation. We are not advocating this course, but it is a possible outcome of events.

Another decision that may be made is that the world is not ripe for the venture, and that it can afford to wait a few years for the appearance of a genius whose claims will impose themselves naturally upon his age. We have seen a figure very nearly approaching this ideal, but it must be felt that he will have to emerge, not from a somewhat aloof northern nation, but from the heart of the Continent. Whatever course comes to be taken, it is of vital importance that the man or men who may be engaged upon this great work shall be imbued with the spirit of responsibility, sincerity, and enthusiasm. The search for precedent will be a vain one: the tricks of competition presentation, as too often understood, will not serve. A vision must be realised before this work can be undertaken, and the vision will work the miracle.

Daily life is becoming more and more cosmopolitan and international, and the League of Nations is the outcome of this tendency and the motive power to its progressive maintenance. The national stamp upon a country's architecture is becoming less dominant and more subservient to a universal period. The League Headquarters will, therefore, be a great building in so far as it succeeds in expressing not only the present drift of events, but the great and peaceful future which we all hope awaits the world. It may be that this building, when it is achieved, will sound the note from which contemporary architecture will find its pitch and from which future critical ages will date the work of the great twentieth century. The man who becomes identified with such an epoch-making achievement will become equally the architectural figure of the age, and we shall rejoice when he is found, of whatever nationality he may be. It remains for the architectural world to realise its task, and for the everyday world to give it its cordial sympathy.

NOTES

The Care of Our Cathedrals.

WE have again and again referred to the question of responsibility for the proper treatment and care of our old ecclesiastical edifices, and we know only too well how sadly many of them have been treated by their normal custodians. In many cases the church authorities have shown a wise and discriminating care of churches, and we owe much to the enthusiastic and well-informed zeal of rectors all over the country. But we think the appeal by Mr. Powys, on behalf of the Society for the Protection of Ancient Buildings, is well timed. He suggests that in the case of cathedrals the fabrics should be under more expert control than they often get at the hands of cathedral authorities, whose proposals should receive the sanction of some national authority before any work is undertaken. The appeal from Mr. Powys is made apropos of the proposal to build a new Lady Chapel on the Norman foundation, at the east end of Norwich Cathedral with which his Society is not at all agreed. Who shall settle such a matter and how? Is the Lady Chapel a desirable and necessary addition? The cathedral authorities may be presumed to have a definite opinion of some value on such a point.

French Architecture.

AN opportunity to deal with the characterisation of the Renaissance architecture of France has been found by Sir Reginald Blomfield in his Zaharoff Lecture, which has just been published in pamphlet form by the Oxford University Press, and though it is necessarily only a summary it will be found very precise and illuminating as to the writer's judgment on the various phases and their authors, in the evolution of French architecture after Mediæval times—the difficulties which paved the way for the achievements of de l'Orme, Bullant and the elder Mansart are well described. Of Francois Mansart, Sir Reginald says no modern architect has possessed such an exact and delicate sense of scale and values. He says, "I take the work of Ange Jacques Gabriel in the middle of the 18th century as typical of French architecture at its best, and of all that it stands for. Its lesson is that architecture is the art of form, of rhythm, and proportion, and that its problem is to translate into terms of ordered beauty the requirements of civilised life as it moves on from age to age."

The Guidance of Tradition.

SIR REGINALD has something to say about the breakaway from the great traditions in recent years. He says there is, or was, a fashion for monolithic architecture where the building is regarded as a lump in which holes are provided for doors and windows. He has some appreciative criticism of modern Swedish architecture, but though he thinks of the great law courts of Prof. Ostberg, as the work of a genius, he says "it seems to be the apotheosis, not of architecture, but of that arts and crafts movement started by Wm. Morris and others, some forty years ago, which some good service, but misunderstoo purpose of architecture and too led it astray." Sir Reginald is no dogmatic or arbitrary, perhaps, fo says that "if in the old French ma too great insistence was laid on for the Scandinavian it is not consi enough, and the result is a certain vincialism in design. The world n fast nowadays, and these vig younger peoples with little traditi art behind them, are sure of a hea but when the big drum is being be the finer shades of thought are a be lost, and it is well to listen also t still small voice of the past hinti the reverence that is due to ascert accomplishment, and reminding us we are but one generation in the procession of history."

Architecture as Advertisement.

IT is well to note that i recent report of a succ trading company the man spoke of a bea building as a constant a tisement, which must in increased trading. When we he architectural features which will the new buildings of a company marks in their respective towns, w hardly venture to hope they wi characterised by quite the finest ty street architecture. The word "landr suggests a somewhat strident asse ness which insists on prominen whatever cost. Nevertheless, we ar to read this tribute to the importa architectural design.

Danish Architects at Bath.

From the Exhibition of Modern Danish Architecture.

Crematorium, with Porter's Lodge, Copenhagen.

Mr. Holger Jacobsen, Architect.

A District Council and Architects' Fees.

Architects may rub their eyes when reading an advertisement recently issued by an Urban District Council, wherein they are invited to submit schemes for the uilding of forty non-parlour type and en parlour type houses under the 1924 Housing Act on sites to be selected. It s stated that the sum of twenty guineas ill be paid to the architect whose cheme is selected. Nothing is mentioned s to the supervision of these fifty houses uring their erection, and we are to pre-ume that the sum named is to be the sole emuneration of the successful architect. t may be observed that twenty guineas or fifty designs works out at 8s. 4⅕d. for ach design. It is inexcusable that a ublic authority should squander public noney in this way, assuming that the dvertisement means what it says.

The Lure of the East.

It is a welcome sign of growth in appreciation and knowledge that the art of the East is now given so much more recognition. his growth in appreciation is exer-sing a beneficial influence on our own rt, extending our conceptions from ie now rather obsolete classical tradition. alf a century ago only, it was even ie habit to refuse the name of art to astern craftsmanship, a craftsmanship rich in imagination and serenity. he influence of John Ruskin was very trimental in respect to this, while it sted, as he would not allow to Eastern pression the name of art at all. For-erly discussed only in its ethnological arings, the art of the East is now seen bear comparison with the noblest hievements of early Western mediæval t. To mention but a few examples, e Ajeuta wall paintings, the Ellora mple, the temples Sik Hara and Linga Raj, in India, the glorious Angkor temple in Cambodia, and the Boro-budur in Java, present both in their architecture, and their sculptured ornament, efforts which for serenity, loveliness and completion are comparable only with the noblest achievements of art. These and other temples inspired by the influence of the best period of Buddhist teaching, offer us an example of that corporate achievement which in brief centuries of the world's tragic history has given to life a robe of amazing beauty.

Out of-Date Art Teaching.

Though it is not generally the case, we think, we are sorry to observe a tendency to impose on the student in certain schools a reactionary influence, encouraged in influential quarters. But it is well for the student to have the courage of his own thoughts and outlook, and it is not well to compel him into a mould, or enclose him in a system which too greatly obstructs the freedom of his own fresh outlook. We therefore regret to see this tendency to attack fresh vision in the approach of painting, when such an outlook in the student reveals a vitality and initiative which should be much encouraged, guiding rather than obstructing it. This endeavour to coerce the student into orthodox ways, and to assail any deviation from so-called academic precedents, is particularly unfortunate at the present time. For these precedents mean usually little more in those who profess them than the old use and wont—antagonistic to new discovery. The vision of the young may prove less sullied than the teaching imposed on them, yet we hear of this reactionary tendency being exercised with considerable pressure upon the student, in order to check his own initiative and point of view. Academic precedents have lost too much of their vitality to claim any great respect from us to-day, and though we are anxious to see due regard paid to the claims of tradition, we should be very sorry to see the student absorbed by these more static considerations.

The Surveyors' Institution.

Another of those pleasant afternoon functions which are now recognised as one of the regular events of the year arranged by some of our learned or professional societies, took place on Tuesday, when a reception was held by the President and Council of the Surveyors' Institution, in the Gardens of the Zoological Society, Regent's Park. Following the reception in the Library of the Society, members and guests proceeded to the parts of the grounds reserved for their use, where refreshments were taken and the band of His Majesty's Grenadier Guards was in attendance. The weather was very favourable for such a function, and a most enjoyable afternoon was spent in the grounds, the Aquarium, and elsewhere, by the large party of members and guests who were present. The Zoological Society are proceeding with the erection of the new reptile and monkey houses—the reptile house being almost finished—and are undoubtedly improving this very popular resort.

Memories.

A very readable little pamphlet has just been published entitled "Workshop Memories," by Mr. Alfred Fincham. It details some of the incidents in a mason's life in which technical details and human sympathies are quite pleasantly mingled. It is published at Finchdene, Colney Hatch Lane. Simple annals of a craftsman's life like this are all too rare.

GENERAL NEWS

Professional Announcements.

Messrs. Welch and Hollis, F. & A.R.I.B.A., announce that their partnership has been dissolved as from March 25, 1927. Mr. Welch will continue to carry on his practice at 7, New-square, Lincolns Inn, W.C., as hitherto, and Mr. Hollis will practise in future from 53, Great Marlborough-street, Regent-street, W.1. (Gerrard 6158.)

Mr. A. G. R. Mackenzie intimates that his firm, Messrs. A. Marshall Mackenzie & Son, have moved their offices from 75, Victoria-street to 39a, Maddox-street, W. 1. Telephone : Ambassador 9720.

Mr. Arnold Silcock, A.R.I.B.A., has removed from Gray's Inn to 97, Jermyn-street, St. James's. Telephone No. : Gerrard 6902.

Architect's Estate.

Mr. Edward Dodgshun, F.R.I.B.A., of Littlecroft, Boston Spa, left £32,969.

Sculpture Group for Bank.

The model from which two bronzes have been made for the exterior of the National Provincial Bank at Cardiff (see illustration on this page) was designed and executed by Mr. J. A. Stevenson, F.R.B.S., A.R.C.A. (Lond.), sculptor, for Messrs. G. and A. Brown, Ltd., who carried out the work for the architect, Mr. F. R. C. Palmer, F.R.I.B.A., and the assistant architect, Mr. W. F. C. Holden, F.R.I.B.A.

The Chelsea Society : Exhibition.

The Chelsea Society will hold a Chelsea Exhibition in the Council Chamber of the Chelsea Town Hall, King's-road, S.W.3 (by kind permission of the Mayor), from Thursday, June 9th, to Saturday, June 18th, 1927. The exhibition, which will be open daily from 2 till 7 o'clock (Thursdays till 8 o'clock), will contain pictures of Chelsea Past and Present, photographs of Chelsea 60 years ago, a small representative collection of old Chelsea china, and rare Chelsea books, prints, tokens, broadsides, autographs, etc.

Ancient Bridges.

Charged with the task of inspecting and reporting on the condition of ancient bridges in the West Country, the touring investigator of the Society for the Protection of Ancient Buildings is paying visits to Wiltshire, Somersetshire, Dorsetshire and Devonshire early this month. He will follow all the rivers and their main tributaries, and among the more important towns he will visit are Marlborough, Chippenham, Trowbridge, Bradford-on-Avon, Frome, Sherborne, Lydford, Glastonbury, Langport, Taunton, Wellington, Tiverton, Chulmleigh, Chawleigh, Barnstaple, Torrington, Southmolton, Simonsbath, Exford, Winsford, Dulverton, Bath and Malmesbury.

Danish Architects at Bath.

The party of distinguished Danish architects who are now in England under the auspices of the Architectural Association, have visited many places of interest in and around London, and as a part of their programme they went to Bath on Wednesday, May 25, in order to study the Georgian architecture of which Bath possesses so many fine examples. The party numbered about thirty, and included Mr. F. Yerbury and Messrs. C. E. Lawrence and C. F. W. Dening, of Bristol. The morning was spent in the City, viewing notable examples of architecture, under the guidance of Mr. A. C. Fare, A.R.I.B.A. Mr. Hatton conducted the visitors over the Pump Room and the modern baths, and the Venerable Archdeacon of Bath personally showed them around the Abbey, and they were afterwards shown the Roman Baths under the guidance of Mr. Alfred J. Taylor, F.R.I.B.A., architect to the Baths Committee. After tea, a visit was paid to Prior Park on their way to Limpley Stoke, where they spent the night, and the next day saw Bradford-on-Avon and on to Wells, returning to Bath, and thence proceeding to London. The visitors expressed great admiration for the architectural beauties of Bath and of the Roman Baths.

At the conclusion of their week's visit to this country, the Danish architects were entertained to dinner by the Architectural Association at Bedford-square on Friday last. The function was a most enjoyable one, and a spirit of rare cordiality and good fellowship prevailed. Mr. J. Alan Slater, President of the A.A., proposed the health of the Danish visitors in an excellent speech, and Mr. Emanuel Monberg, President of the Danish Architectural Association, replied.

Development of Rural Industries.

The Exhibition of Blacksmiths' work, and that of other rural industries at the Hertfordshire Agricultural Society's Show, Hatfield, Hertfordshire, on June 9, is the third of its kind which has been organised under the auspices of the Hertfordshire County Council Rural Industries Sub-Committee. At this year's exhibition further developments are taking place, and in addition to exhibits of articles made by smiths and wheelwrights, a representative display of saddlery work will be on view, and there will also be a demonstration of saddlery machine work. In connection with each of these exhibitions there is published a full list of exhibitors, with their addresses, and copies of this are sent to the Royal Institute of British Architects, and to architects who write for such information. The main object in arranging these exhibitions is to aid in the revival of rural industries, and to remind the public that the smith, the wheelwright, and the saddler, residing in their midst, are all skilled craftsmen, able to produce a sound and thoroughly well-made article at a reasonable cost, and possessing that pleasing stamp of individuality which is so lacking in the ordinary machine-made article.

Royal Academy Exhibition, 1927.

"The Balance." Figure for Exterior of National Provincial Bank of England, Cardiff.

Mr. J. A. Stevenson, F.R.B.S., Sculptor. Messrs. Palmer & Holden, Architects.

COMPETITION NEWS

St. John's and Renfield and Hyndland United Free Church.

The Deacon's Court invite from architects practising in the province of the Glasgow Institute of Architects competitive designs for a new church proposed to be built in Beaconsfield-road, Kelvinside. Application for conditions of the competition should be made to Mr. Joseph Cousland, 9, Lillybank gardens, Hillhead, Glasgow, W. 2, not later than Saturday, June 11. Mr. James Hunter, F.R.I.B.A., will act as assessor.

OBITUARY

Mr. Arthur Reginald Sage.

We regret to record the death of Mr. Arthur Reginald Sage, who died on Wednesday of last week, at the age of 48, after a long illness. As Principal of the L.C.C. School of Building, Brixton, since 1922, Mr. Sage steadily developed the work on the lines laid down by his predecessor, the late Mr. H. V. Richards, with whom he had been associated as Assistant Principal from the foundation of the school in 1904 until 1919. In that year he was appointed an Inspector under the Board of Education, a post he filled successfully until the death of Mr. Richards, when he was appointed by the London County Council as Principal of the School of Building. During the war period Mr. Sage devoted his great knowledge and ability to the training of workers for munition factories, and when a portion of the school was set apart for the training of workers in engineering, the building side was represented by training in lead burning, coppersmithing, woodwork machinery, aeroplane propeller making, aeroplane assembly, and compass painting. For his services Mr. Sage was made M.B.E. He was a man of unassuming personality with a great capacity for work, coupled with thoroughness and accuracy.

On Monday, May 30, a service was held in the large hall attached to the school. The boys were drawn up in files and stood to attention while the prayers were read by Canon Swallow. Mr. Smail and Professor Beresford Pite addressed them, and pointed out what Mr. Sage's work had done at the school, and how he had brought the school up to its present high standard, and by his sympathy and example had produced such a high tone and *esprit de corps* among the students.

At the funeral there were over two hundred people present, representing Mr. Sage's family, the advisory committee, and staff and senior boys of the school, representatives of the staff of the London County Council, the Principal of the Technical Institute, members of the Renaissance Lodge and the Perfect Structure Lodge, in each of which Mr. Sage was holding office. A very large number of beautiful wreaths were placed on the grave. The quiet service will long remain a memory of a wonderful tribute to a man whose work will go on though he has passed to his rest.

MEETINGS

Thursday, Friday and Saturday, *June* 2-4.

Institution of Municipal and County Engineers.—Scottish District Meeting at Dunfermline.

Saturday, *June* 4.

Institution of Municipal and County Engineers.—South Eastern District Meeting At Maidstone.

Thursday, *June* 9.

Hertfordshire County Council.—Exhibition of Smiths', Wheelwrights' and Saddlers' Work. Also presentation of prizes by the Viscountess Hampden. At Hatfield Park, 3 p.m.

Architecture in North Africa.

The illustrations which we give on pages 881-3 should be studied in connection with Mr. Arthur J. Davis's paper on "Architecture in North Africa," read before the R.I.B.A. on May 23, a report of which was given in our last issue.

The Saadian Tombs, Marrakesh. (*see page* 880)

DEVONSHIRE HOUSE BUILDINGS.

AT Monday evening's meeting of the R.I.B.A., Mr. Arthur Keen, Vice-President, in the chair, Professor C. H. Reilly read for Mr. Thomas Hastings, Honorary Corresponding Member, a paper on this subject. After an introductory reference to the traffic and other problems which had been created in New York by the growth of abnormally high buildings, the writer said that in the evolution of buildings of the multiple-story residence type they had the tenement house and the apartment house, differing in degree only as to location and quality; also the apartment hotel, a combination of the hotel and apartment house functions, with the limitation against independent cooking in the apartments of the several tenants. In general, in the apartment hotels, the cooking in the apartments was avoided by a central kitchen, operated by the hotel management, with service to the several apartments by means of lifts. In many of these buildings each apartment was provided with a small serving pantry through which the lift from the central kitchen passed, while in other cases the service from the central kitchen connected with a serving pantry on each floor, from which the individual apartments were served by the hotel employees. Under the provisions of their Building Code and Tenement House Law, a non-fireproof tenement or apartment building might not be erected in excess of six stories in height, nor might it exceed in height one and one-half times the width of the street, or a maximum of 150 feet. Apartment hotels, however, were under no such restriction, and might be carried to an unlimited height, subject only to the zoning requirements for set-backs as determined by the street width and the particular zone in which the building was erected.

The large amount of money required to carry forward such a project to completion, and to a point of producing revenue, made it important that the construction work should proceed with the utmost speed, and that every effort should be made to eliminate avoidable delays. From the inception of the project those rules applied both to architect and builder, and in each case it had been necessary to develop methods of securing results which had gone hand in hand with the evolution of the building of large area and great height. The schedules of progress, subdividing the work into its constituent parts, were prepared with great care, and proved most helpful in co-ordinating the preparation of materials for the several branches of the work and in determining in advance the rate at which the work must proceed to ensure completion by a specified date. Expeditors in the field and shop carefully checked the progress of the preparation of the materials for the structure, and saw to it that shipments were made so that the materials might reach the work as required and in proper sequence. Successful results could not be obtained if the architect did not supply the contractors with all needed information in time to meet the scheduled requirements, and the architect must see to it that all contractors employed on the work were co-operating and maintaining the scheduled progress. Those conditions had led to the adoption of methods of construction which ensured rapidity of completion and the development of skilled engineers who were trained in the scheduling of operations and the following through and co-ordinating of the work in the shop and at the site. All of this was of the utmost importance to the investor who wished to determine the extent of his investment and the period during which he must carry the burden of expense before returns might be expected.

While he trusted London would never follow the lead of America and permit the advent of the tall building, it was interesting to note the innovation of an apartment house of the American type on Piccadilly. When the good old Kent house and leasehold, so long the property of the Dukes of Devonshire, were sold to the firm of Messrs. Holland & Hannen and Cubitts, it was realised that, due to the changing character of its environment, the old house must give way to the encroaching commercial demands. Messrs. Holland & Hannen and Cubitts selected Professor Reilly as their adviser, and it was because of the fact that Professor Reilly was unusually familiar with American architectural practice, and the development of the apartment house problem in America, that he first advised the selection of an American architect, and then, because of the great and much-appreciated honour the Royal Institute of British Architects had so recently conferred upon him (the writer), that he was suggested as the architect. His delight was unbounded when he received a cable from Messrs. Holland and Hannen and Cubitts asking if he would be interested. Professor Reilly collaborated with him to the fullest extent and on an equal footing in designing and assisting in the execution of the building.

The programme was, in a sense, a new one for London, and therefore the outcome or results must of necessity be somewhat foreign, and this fact made them all the more anxious to produce harmony with their neighbours. They all agreed that they would build as much as possible in a style which would seem to be modern, and, at the same time, related to the traditions of their immediate ancestors. They naturally drifted into what, perhaps, might be called the period of the English revival of Italian classicism in the early nineteenth century. As a matter of composition, which, of course, if properly undertaken, would of necessity make its impress upon the style and character of the design, they agreed that they should first of all make the facades express what they clothed. There was no dominating principal feature in such a building to express itself in facade and add colour to the results. They must obtain colour and interest with all the openings the same size and stories the same height, excepting the ground floor, which was to be reserved for housing banks or other institutions of similar character.

The first thing they did was to make certain well-defined restrictions for themselves, so as to come within reason and at the same time adhere to the practical point of view. They fixed the floor lines equal in height, and the window sills and lintels at equal distances from the floors of each story, without admitting of any variation. This, they felt, was a vital part of their programme, and any colour obtained with the distribution of their openings would of necessity be obtained within those limitations. In accordance with the natural law, if this were adhered to their design would of necessity express the purpose for which it was made. They, furthermore, avoided the superfluous use of pilasters or pediments and other architectural motives which would destroy the uniformity and simplicity they believed should express the problem to be solved. In a general way, they soon determined upon a recessed central front, so as to give extra corner rooms for light and air in the apartments. The widening of Berkeley-street was very wisely determined upon by their clients, and they all agreed that the main entrance to the apartments should be placed on a new street—they were to determine upon connecting Berkeley with Stratton-street; this would give the maximum frontage for rental on the three remaining streets.

The plan was a difficult one because of the necessity of placing the elevators so as to arrive advantageously for the best apartments on the Piccadilly front. He could not close without a word in appreciation of the gratitude to Mr. Jackson for the admirable and conscientious way he interpreted the drawings in the hallways, somewhat Pompeian in design, and the dining-room, which was designed in the Adam character.

Having read Mr. Hastings' paper, Professor Reilly, in the course of some remarks of his own, explained that he had had little to do with the design of the building beyond the composition of the main masses. He and Mr. Hastings held a small preliminary competition between themselves in New York for a building which was originally intended to cover the whole of the site instead of roughly one-third of it, as now. (The lecturer here exhibited a small model of the original scheme.) The working drawings for the building, he continued, even the full-size details, as well as the models for the carvings, were prepared in New York. The drawings came over within three months and were complete in every way, and the building was finished in a year—May, 1925, to May, 1926. This rapidity of erection was in large measure due to the remarkable organising ability which the contractors (who were also the building owners) brought to bear upon the work. They produced a progress schedule (published in *The Builder* for February 11, 1927) of the greatest minuteness; and what was of equal importance with the schedule was the organisation of the work of the sub-contractors on the job itself. The sub-contractors were brought face to face with one another at regular intervals, and any matters in dispute affecting the progress of the work were cleared up then and there. The secret of such rapid building was the working together of architects and contractors as a team. (Professor Reilly concluded his address with a running commentary upon a number of lantern slides of plans and other drawings of the building, followed by a series of photographs showing the progress of the work month by month.)

Proposing a vote of thanks to Mr. Hastings and Professor Reilly, Mr. Edward C. Hann, Chairman of Devonshire House, Ltd., emphasised the importance of speed of construction in connection with such buildings as Devonshire House. When it was realised that ground rent and interest might amount to £1,200 per week, it was apparent that other economies became insignificant in comparison with the saving of time. Referring to some of the difficulties encountered in the planning of large blocks of flats, the speaker said it would be found that practically every tenant had different views as to what constituted a comfortable apartment. One tenant would complain that the temperature was too low—another that it was too high; actually in Devonshire House, it was a uniform 65 degrees. Then there was the difficulty of altering flats to suit the individual requirements of tenants as they came in. The speed with which Devonshire House had been completed was, in his opinion, due to the fact that the architects had succeeded in creating a spirit of co-operation and good will. If the building trade was to progress, architects, contractors, and workmen must co-operate more and more.

Mr. H. W. Tompkins, Past-President of the Royal Victorian Institute of Architects, seconding the vote of thanks, showed further examples of building work in Melbourne and Sydney how, by adopting a progress schedule, the period of construction had been reduced by from 25 to 30 per cent.

Ir. J. R. Sharman (consulting engineer the steel construction of Devonshire se) emphasised the importance, in the case such buildings, of arranging the steel chions on a methodical plan or grid. The ls on the stanchions were more or less ılised, and consequently one could use a ll number of sections. When there was ırge number of sections, the steel con- tor was justified in asking for more time. h regard to the special motor showrooms)evonshire House, which, through having)e provided after the steelwork had been ted, involved the cutting away of part of mezzanine floor, the problem was over- e by a construction of steel stanchions angle irons embedded in concrete.

r. W. S. P. Godfrey, Past-President of Royal Victorian Institute of Architects, r some appreciative comments upon the er, turned to the question of Registra- . They were, he said, "registered archi- s" in Australia, and their next move ld be to try to do away with the word ·gistered." In England we were ap- ·ntly having the same difficulty that they in Australia, namely, that the Govern- it would not give a clear Bill. They had ·pted their own Bill in its unsatisfactory n and hoped in the future they would able to eliminate the parts they did not . We should find, as they had found in .tralia, that it would be necessary to admit reat number of men who were not strictly tled to be called architects.

Ir. W. Henry White having contributed ew remarks to the discussion, the Chair- ı referred to the constantly increasing ght of buildings in London, in spite of the ilding Act. London was spreading hori- tally so fast that an immense pressure was ng brought to bear upon Central London. 'rofessor Reilly, in a brief reply, pointed that Devonshire House complied with the ilding Act; it was no more than 80 ft. to cornice, with two stories in the roof.

Moulay Idris. (*See page* 898.)

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks or correspondents, who will oblige us if they will express their views as briefly as possible.]

The Amended Bill.

SIR,—The executive committee of my Association were surprised and somewhat perturbed to learn that the official witness of the Royal Institute of British Architects, at his first appearance before the Select Committee on the Architects' Registration Bill, had suggested that the Institute was prepared drastically to amend Clauses 11 and 12. The effect of the amendment, if adopted, would be to permit any person, however incompetent, to call himself and practise as an "architect" without let or hindrance; but a class of "registered architects" would be created who, on the contrary, would be subject to the jurisdiction of the registration authority and pay for its upkeep.

It seems obvious that, while "registered architects" would not be able to practise with the same freedom as their unregistered confrères, the only incentive offered them is the lure of the word "registered." No one troubles now whether the plumber called in to do a job is a "registered plumber" or just a plumber who plumbs; is it likely, therefore, that the building owner will concern himself as to which category of architect his proposed consultant belongs?

If one accepts the correctness of the statement often repeated by the R.I.B.A., that the original clause 12 did not prevent any man from charging and recovering fees for professional work of an architectural nature, as long as he did not call himself an architect or architectural designer, etc, the object of the latest amendment becomes somewhat nebulous. It would certainly remove a disability created by the original Bill, in so far as officials or local authorities, civil and structural engineers, heads of architectural departments of co-operative societies, and others would now be permitted to call themselves "architects."

But if the "registered architect" is to be soon recognised as being superior to the "architect," does it not follow that these engineers and officials of various bodies, many of them highly competent men, will not content themselves with the inferior designation of plain "architect," the label of the untested or unqualified, but will take the necessary steps to become "registered architects?" The proposed amendment could, therefore, be of no use to competent men, but would allow the unqualified to mislead the public by representing himself to be, and using the designation of, an "architect."

My Association has always approved the principle of registration, and intimated its offer of co-operation to the Institute as long ago as August, 1926. While its existence was for all practical purposes ignored for many months by the promoters of the Bill, some of its proposed amendments and suggestions were eventually adopted by the R.I.B.A. as the result of conferences which took place in the early months of this year. But can any serious advocate of registration lend support to a measure which now side-tracks the basic principle that the title of architect must be unequivocally reserved to those who have passed the necessary qualifying tests?

Three different editions of the Registration Bill were issued by the Institute at short intervals; now it proposes further amendments which negative the original purpose of the measure. Is the R.I.B.A. intent on getting some Bill through Parliament at all cost, whether it is of any value to the profession or not? If the answer is in the negative, would it not be better to withdraw an ill-conceived document and make a fresh start by seeking from the first the co-operation and advice of all professional men and other interested bodies with the object of compiling a well-thought-out, comprehensive, equitable, albeit strong Bill, which would promote the interests of architects, safeguard the public, and secure for the latter improved technical and artistic services?

I would add that the official witness of this Association, when he appears before the Select Committee, will press for the retention in the Bill of the original clauses with but slight modification.

G. B. J. ATHOE,
General Secretary.
The Incorporated Association of Architects and Surveyors,
15, Bedford-street, W.C. 2.

Liverpool Library of Art.

A scheme new to this country is being launched in Liverpool in an effort to find the artist a market for his work. For an annual subscription of five guineas, each member of a newly-formed Art Circle will receive in his home every month an oil painting, water-colour, etching, or piece of sculpture by a contemporary Merseyside artist. The works will be delivered and collected free of charge. A central studio will perform some of the functions of a lending library of art. Here the subscriber may see samples of work and indicate his preferences. The picture or piece of sculpture, the price of which is known, may be bought, says the *Times*, either by the subscriber or by any of his friends, whose attention he is expected to call to this particular object of art in his house. A committee, headed by Dr. Harrington, director of the Birkenhead Art Gallery, is charged with selecting the works. The Lord Mayor of Liverpool is at the head of the movement, and Lord Derby, the Bishop of Liverpool, and Professor C. H. Reilly are among others taking an interest in it.

THE REGISTRATION BILL IN PARLIAMENT

Proceedings of the Select Committee.

When the Select Committee resumed consideration of the Bill on Tuesday week last, the examination of Mr. Norman Scorgie and Mr. Edward Willis on behalf of the Institution of Municipal and County Engineers was begun.

Mr. Scorgie said that his Institution were particularly concerned with the amendment of Clause 20, which had been agreed to by the Royal Institute of British Architects. This amendment was not only desired by the Institution, but also by associations representing Local Government authorities. Its inclusion would render it unnecessary for such bodies to consider the necessity of tendering evidence on matters of detail.

The Chairman: If the Clause is amended as suggested, that will meet your point?

Mr. Scorgie: Yes. The R.I.B.A. have promised us that. I would also like to call attention to Clause 5 (1) (c). As it reads at present it does not meet our case. We have in our profession many men who were educated as architects, but who have now municipal appointments. We suggest that if these individuals desire to go back to their first love they should have an opportunity of doing so. The clause should be amended to include those persons who have been in bona fide practice as architects prior to the passing of the Act, but who having relinquished such practice at any time may desire to resume it later.

The further examination of Major Barnes was then resumed.

Sir F. Rice: The builders are very much concerned in the control being handed over to the Institute. They want to be quite sure there is no attempt to force on the building trade a form of contract which will not consider all interests concerned.

Witness: On that I think I can give every assurance that no such attempt will be made. So far from adopting an attitude of that kind the whole history of the Institute is a history of growing consideration and co-operation with the contractor. I am quite sure Sir Frederick will agree that the present form of contract which bears the *imprimatur* of the Institute is far in advance of the contract which was in existence 30 or 40 years ago.

Sir F. Rice: What would satisfy me would be an assurance that there will be no further attempt to foist on the building trade any contract they do not like.

Witness: I do not know if "foist" is an appropriate word, but I think you may be quite sure that men of goodwill on both sides are endeavouring to come to an agreement.

ON Thursday week last, Mr. W. Forbes Campbell, President of the Incorporated Association of Architects and Surveyors, dealt with the evidence given on the previous Thursday by Major Barnes, the official witness for the promoters of the Bill. Mr. Campbell said that in common with his Executive Officers he felt that the statements made by Major Barnes, and answers to the Chairman's questions, might prejudice the Association's case in the eyes of the Committee. He would place the most charitable interpretation on Major Barnes's evidence relating to the Association, and suggest that he was speaking without knowledge of the true facts. The speaker contended that he appeared for the second largest architectural association in this country. Major Barnes, in his evidence, admitted that the Association was as devoted to the cause of registration as the Institute and its allied societies, and the witness entirely agreed with that expression of opinion. He trusted that when his evidence was completed the committee would agree that the Association was even more devoted to the cause of registration than the august body represented by Major Barnes. In answer to the chairman's questions inquiring whether there had been any real attempt on the Institute's part to co-operate with the Association or to allow them to co-operate with the Institute regarding the promotion of the Bill, Major Barnes had replied, "Yes, there had been very real negotiations carried on." To that reply the witness would have something more to say later in his evidence. He might say at once that these negotiations were somewhat belated. The onus, as he would prove, lay with the Institute and not with the body he represented.

The Bill was published on February 11. The negotiations between the Institute and the Association began on the 29th of that month and ended on April 6, so it would be appreciated that the Institute had fully made up its mind on the terms of the measure before entering into negotiations with the Association. Major Barnes stated that as far as the administration of the Bill was concerned he understood that the Association were satisfied with their inclusion on the Admission Committee and on the Board of Architectural Education. They were not satisfied, and they had all along insisted upon an independent statutory Board or Council. He would deny Major Barnes's statement that there was only one architectural body in this country which had tradition behind it or which had an appreciable number of the architectural profession behind it. In another part of his evidence Major Barnes stated that the Association was an off-split from another body. This was not in keeping with the facts, nor was the Association connected with any body known as the Faculty of Architects. In another paragraph of his evidence Major Barnes said his Institute were quite willing to give the Association every possible opportunity of safeguarding the rights of their members. The very reason that brought them before the committee that day was to endeavour to obtain guarantees that the rights of the Association and its members would be safeguarded.

The Chairman said they were not there to give guarantees.

Mr. Campbell replied that they wanted to endeavour to obtain them. In reply to the Chairman, Major Barnes had said, in regard to the status of the Association, that "in a certain sort of way," whatever that might mean, the Association occupied a kind of intermediate position between the Royal Institute and the Surveyors' Institution. He followed on by saying that the Association were a kind of composite body which took in both architects and surveyors, and that again, in itself, was another reason why the Association should not be regarded as a member of a general architectural body. To these statements he (Mr. Campbell) would reply that his Association was made up of architects pure and simple, surveyors pure and simple, and quantity surveyors pure and simple. The percentage of membership was as follows:—architects, 70 per cent.; surveyors, *i.e.*, persons who practised as surveyors only and not as architects, 25 per cent.; and quantity surveyors, about 5 per cent. Of course some of their architect members practised as surveyors also, but the same applied to the R.I.B.A., for many of their members practised as architects and surveyors. It would be further appreciated from the figures given that the Association was mainly if not purely an architectural body, and in this respect it did not differ from the R.I.B.A. except that by the rules of the Association quantity surveyors were not allowed to practise as architects, whereas the R.I.B.A. allowed their members to act as quantity surveyors. This, he might say, was a bone of contention in the profession that only the Association had endeavoured to deal with. To show the belated manner in which the Institute had carried on their negotiations, he would draw the attention of the committee to a part of Major Barnes's evidence in which he admitted that it was only last week the situation with regard to Northern Ireland was decided and a conclusion reached.

The Chairman: We have officially received from the North of Ireland people an intimation that they desire to be within the Bill.

Mr. Campbell then passed to the matter examinations. He was not altogether pleased with the trend of the questions and answers relating thereto. These questions and answers, to his mind, would convey the impression that only the Institute's examinations would be accepted in the future as a preliminary to registration.

Coming to the amendments to the Bill suggested by the Association, witness said there had been little time for their executive officers to prepare a précis of evidence and the schedule of amendments, having regard to the fact that the witness for the promoters had but a few days previously introduced many amendments. The Bill was materially changed from the Bill before them at the time of the second reading. He was pleased to say, however, that they had been able to simplify somewhat their schedule of amendments without materially affecting the issue. The first amendment had reference to the constitution of the council or supreme authority. Under the Bill as it had reached the Select Committee, this was to be vested solely in the Royal Institute. He submitted that such a proposal was contrary to the tendency of modern legislation, which as a rule constituted independent statutory Boards, such as the Dental Board. The present Bill did not contain any provision for the constitution and procedure of such a board. They had, therefore, drawn up a third schedule to the Bill containing suggestions in regard to the composition of the Board. It would be observed that representation had been given to all professional societies whose members might be affected by the measure. A large representation had been given to the Royal Institute, including its Allied Societies, as the second architectural body the Association submitted they should have the second largest representation, and certainly a larger representation than other societies whose interests were not so directly concerned. In this respect the Association, although its membership was numerically less than the Royal Institute, was rapidly growing. Its membership was already a substantial one and as such was entitled to adequate representation on any permanent council that might be set up.

Another argument in favour of such a proposal was that by a slight alteration of Clause 10 a person refused admission to the register could be empowered to appeal against the decision to the Council who should hear him. Such a plan would prevent an intermediate court which might render an appeal to the High Court unnecessary, except in exceptional cases. As at present proposed, the financial cost of an appeal might prove an unjust deterrent to an aggrieved appellant. As an instance of an independent board, he would like to cite an example in South Africa. In the Union of South Africa, an architects' registration authority had been set up, and was composed of representatives from each of the architectural societies in the Union. Furthermore, when the Bill for the registration of architects in South Africa was drafted, each architectural society was invited to co-operate in its drafting. Major Barnes had not made out a good case for his contention that the Royal Institute should be the supreme authority or governing body. The Institute recognised other professional bodies in Schedule 2 of the Bill, and included in these were several old and highly respected institutions whose status was equal to that of the R.I.B.A. There was, for instance, the Institution of Civil Engineers, the Surveyors' Institution, the Society of Engineers, the Institution of Municipal and County Engineers, and the Institution of Structural Engineers, all with very large memberships. All these bodies possessed members who claimed the right to use the title "architect," and many of them no doubt were justified in doing so.

The promoters of the Bill were apparently nxious to obtain their assistance on the Adissions Committee, and why should not ese bodies have representation on the upreme Council? Then there was his Assoation. The promoters agreed that they ere entitled not only to representation on e Admissions Committee, but that they ere worthy of inclusion among the learned cieties sitting on the Board of Architecral Education. He submitted, therefore, at they were worthy to be included on the ouncil to be set up under the Bill. If they ere not worthy they ought not to function any committee. They had special objecn to the R.I.B.A. being the supreme body. e had in mind the attitude of splendid olation displayed by the Institute in their rrespondence with the Association relative the Bill. Six months before the Bill was esented to Parliament the Association made offer to the Institute to co-operate with d assist them in the preparation of a Bill. he Institute did not accept the offer, and ve the Association no opportunity to exess their views before them. It was not til nearly four months after their first plication that the Association received a py of the proposed Bill. The Bill was a grant example of an attempt on behalf of e Institute to exercise a monopolistic and ctatorial control over the profession. veral people thought the Bill was a Governent measure.

When the first draft Bill was circulated, rong objections to its terms were raised t only by his Society but by other societies, d a second draft Bill appeared. Pressure st have been brought to bear on the proters, for a third Bill was prepared, and is was the Bill presented to Parliament. p to the time of the issue of the second aft Bill his Association had been ignored, d it was not until his Council intimated at they would resolutely oppose the mea-re as it stood that the promoters met them conference. But it was then too late to fect any material change in the Bill. The ssociation s request that the Council should an independent statutory body was a fair quest, and it should be granted in the terests not only of the professional bodies ncerned but of the general public.

Mr. Campbell then came to the second nendment suggested by the Association, mely, persons entitled to be registered ithout examination (Clause 5). He said his ssociation considered that present members the Institute, including, of course, its llied Societies and architect members of his ssociation, should be included in this clause. the Bill became law the duties of the gistrar would undoubtedly be very heavy, any rate during the first year of office. one of the conferences held between the yal Institute and the Association he (Mr. mpbell suggested to Major Barnes that tremendous amount of the registrar's work uld be saved if their respective bodies forrded lists of members who were qualified r registration to be registered *en bloc*. ajor Barnes agreed that this suggestion s a sound one, and witness now submitted at provision should be made in the Bill to rry this into effect. After all, it only ected practitioners who had already satisd their respective societies that they were na-fide architects. If the registrar objted to an individual he had power under e Act to refer the matter to the Admissions mmittee. To avoid the necessity of a pplicant having to pass an examination r entrance to the Association and then ving to pass another for registration, or ve-versa, it was submitted that the passing the Association's examination (or the Institute's or any other approved body), ovided such examination was approved by e Board of Architectural Education, should alify a person for registration.

With regard to the Admissions Committee (lause 3), as at present provided, this Comittee was given a limited life. The Assoction considered it should be a permanent committee, more especially as it would undoubtedly function as an inexpensive appeal tribunal for persons who had been refused registration by the registrar. Another of their amendments provided for extra representation of his Association and the Association of Architects, Surveyors and Technical Assistants.

As to the fee payable for registration, his Association was, and always had been, in favour of the payment of a nominal fee for registration by the person registered. Later on in his evidence he would state that the Association desired registration to be compulsory and not optional. If the suggestion for an independent Council were adopted the annual fee for registration could be decided by agreement between the various bodies represented. He thought it safe to reckon that with so many professional bodies represented the fee would be kept as low as possible. So far as the Association was concerned, they were prepared to pay the fees for registration of their members, and he thought their example would be followed by other societies. Persons practising other professions had to pay annually for a licence. The auctioneer paid £10, an appraiser and house agent £2, and even a pedlar had to take out a licence.

The Association naturally felt that they ought to be represented on the Discipline Committee in view of the fact that some of their members might be affected. If the R.I.B.A. Council became the Council under the Bill, there was little doubt that the members of the Discipline Committee appointed by the Council would be Institute members. It was the desire of the Association that Clause 11 of the Bill should stand. They were prepared, however, to delete the words "architecture" or "architectural." If Clauses 11 and 12 of the Bill were amended as suggested by the promoters of the Bill, the Bill became practically worthless. The effect of the amendment, if adopted, would be to permit any person, however incompetent, to call himself and practise as an architect without let or hindrance. But a class of "registered architects" would be created who, on the contrary, would be subject to the jurisdiction of the registration authority and pay for its upkeep. It seemed obvious that while "registered architects" would not be able to practise with the same freedom as their unregistered confrères, the only incentive offered to them was the lure of the word "registered." No one troubled nowadays whether a plumber called in to do a job was a "registered plumber" or just a plumber. Was it likely, therefore, that the building owner would concern himself as to which category of architect his proposed consultant belonged. If "registered architect" was to be soon recognised as being superior to "architect," did it not follow that engineers and officials of various bodies, many of them highly competent men, would not content themselves with the inferior designation of plain "architect" but would take the necessary steps to become "registered architects." The proposed amendment could therefore be of no use to competent men, but would allow the unqualified to mislead the public by representing themselves to be architects and using the designation of "architect."

In conclusion, witness alluded to the question of education. The Association, he said, had spent considerable time and thought in evolving a scheme of progressive education and had kept in mind the necessity of leaving open an avenue whereby working-class boys and girls might attain to the practise of the profession of architecture. He trusted the Bill would be so amended as to afford his Association and other societies the opportunity of carrying into effect a system of examinations which would enable such boys and girls to practise the profession.

Col. Moore: Do I understand you to say that you had no actual conference with the Institute until just before the second reading of the Bill?

Mr. Campbell: We had one conference prior to the second reading.

Col. Moore: Did the negotiations emanate from you or from the Institute?

Mr. Campbell: We had a draft Bill sent to us.

Col. Moore: On obtaining that you communicated with the Institute with a view to discussing it?

Mr. Campbell: Yes.

Col. Moore: I gather you met overt obstruction from the Royal Institute on the matter of amending the Bill?

Mr. Campbell: Undoubtedly there was an attempt. My point is that from last August right up to this year we were absolutely ignored. We have correspondence to show that we tried to get touch with the Institute since last August without result.

Col. Moore: There was no explanation from the Institute as to their objection to meeting you?

Mr. Campbell: There was a conference, but nothing beyond that

In answer to Mr. Gardner, the witness said he contended that the Admission Committee and the Discipline Committee and the Board of Architectural Studies were sub-committees of the Supreme Council, who were naturally governing the whole of the administration, and the effect in the future of the profession. The Association asked that the Admission Committee should function permanently. Major Barnes had in mind the difficulty of men who were architects 30 or 40 years ago, and who wanted to go back to their first love. The Association contended that by a slight amendment of the Bill any man who had a claim could apply to the Registrar. The Registrar could then refer him to the Admission Committee. So long as such claimants were likely to come forward, the Admission Committee should be kept in being.

Mr. Gardner: What are the qualifications by which your Association call men architects?

Mr. Campbell: Applicants must prepare full details in a form, including particulars of early training. In addition to that, we insist upon some of their recent work being shown.

The Chairman: You have no examinations?

Mr. Campbell: No.

Mr. Tasker: I understand from you that the Council of the Royal Institute are thinking of controlling the whole of the architects in this country?

Mr. Campbell: Very shortly, that is the case.

Replying to Capt. Wallace, witness said he would oppose the Bill if it did not entail compulsory registration.

Capt. Wallace: Would you not regard the necessity of submitting the regulations to the Privy Council as a safeguard?

Mr. Campbell: We do not say there would be any abuse.

Sir A. Hopkinson: How long has your Association been in existence?

Mr. Campbell: Eighteen months.

How many members were there to start with?

I think there were few to start with.

Perhaps you can tell us what members you had at the beginning who are known in the architectural world?

I would like an opportunity of submitting a statement.

Mr. Campbell's secretary here stated that the Association did not start with such members as Sir Edward Lutyens or Sir Reginald Blomfield, but they had Frank Brangwyn among their members.

Mr. D. H. Bramall, solicitor to the Incorporated Association of Architects and Surveyors, referring to the report which appeared in our last issue (pages 856 and 857) of the evidence given before the Select Committee of the House of Commons, on the Architects (Registration) Bill, points out that Major Barnes stated (column 3, page 856) that the *Incorporated Association of Architects* was an off-shoot of the *Faculty of Architects*. This statement is repeated in paragraph 2, column 1, on page 857. Mr. Bramall asks us to give publicity to the following facts:—

The Incorporated Association of Architects and Surveyors was Incorporated on September 12, 1925. The Faculty of Architects was registered as a company on May 21, 1926, eight months later. There is no connection, and never has been, we are informed, between the two organisations.

Proposed Elementary School, Watling Estate.

The Hendon Education Committee recently invited six architects to submit, in competition, designs for a mixed school to accommodate 1,216 children, incorporating the most up-to-date principles in school planning. Mr. Arthur Keen, F.R.I.B.A., was appointed assessor, and he has awarded first place to the design of Messrs. Herbert A. Welch, F.R.I.B.A., and H. Clifford Hollis, A.R.I.B.A., second place to Mr. W. G. Wilson, F.R.I.B.A., and third to Mr. C. E. Blackburn, F.R.I.B.A.

The design placed first provides for a south aspect to 19 of the 27 classrooms required, including all classrooms in the Infants' Department. The same aspect will be enjoyed by the Girls' Domestic Science Room (in which will be taught all domestic work, including cooking by means of gas and coal, and laundry work, etc.), Practical (Science) Room (for boys and girls), Manual Instruction Room (for boys), and the caretaker's quarters. A large hall (3,000 sq. ft. in area) has been provided for the senior boys and girls, divisible into two halls (each 1,500 sq. ft.) by means of a temporary partition when desired, and a separate hall (1,200 sq. ft.) for the infants. In addition medical room and babies' room are provided in the Infants' Department. Separate entrances to the school and additional exits to the playground are provided for all departments. The Infants' Department is a separate block connected to the senior school by means of covered ways.

Provision can be made for some of the classrooms to be fitted with French windows to secure open-air conditions when the weather is favourable. Careful attention has been given to ventilation and lighting. Heating will be by means of low-pressure hot water, including a circulation through the hat and coat rails for the purpose of drying the children's clothes. Artificial lighting will be by electricity; provision will, however, be made for an emergency gas service. The floors generally will be of wood blocks, and the classrooms, corridors, halls, etc., will have tile dados to walls for a height of 4 ft. 6 in. off the floor. The playgrounds will be finished in tarmac. Economy—having regard not only to first cost but also to subsequent upkeep—has been carefully considered. The architects' estimated cost of the scheme, including playgrounds, boundary walls, drainage, etc., is £40,800.

The Usher Gallery, Lincoln.

This building has just been completed from the designs of Sir Reginald Blomfield, R.A., FP.R.I.B.A. It is built of red brick with Ancaster stone dressings, and a roof of grey Welsh slates. The front entrance door is of polished ebonised teak. The main entrance is reached by a broad flight of stone steps, and passing through the doorway one enters a lofty hall, at the rear of which, beyond two columns, rises the main staircase, of Portland stone. To right and left are two of the main galleries, and behind these are corridors leading to the Usher Room on the right and a similar room on the left. The floor of the hall is of white York stone, with squares of black marble at the angles. The ironwork of the staircase is gilded. At the rear of the hall is a mural tablet which is to be unveiled by the Prince of Wales.

The four main galleries—two on the ground floor and two above—are each 43 ft. by 26 ft., the walls being coloured a soft dove grey. The floors are of polished oak. The four smaller rooms are each 28 ft. by 20 ft., one of these being specially designed for the exhibition of the Usher collection.

The general contractors were Messrs. W. Wright and Son (Lincoln), Ltd., and the following were sub-contractors :—Thos. Falde and Co., Ltd., horizontal and vertical damp courses and covered roofs and cornices; the Bath Stone Firm, Ltd., Portland stone staircase and entrance paving; Tyrch Slates Pembrokeshire (laid by Pattinson and Co. Ltd., Sleaford), slating; G. A. Brown, Ltd. fibrous plaster and carving; Bromsgrov Guild, Ltd., ornamental iron railings, staircase and balcony; Kleine Patent Flooring Syndicate, Ltd., fire-resisting flooring; Crittalls Ltd., Braintree, gallery roof lights; Milner' Safe Co., fireproof doors to Usher Room; J Keith and Blackman, Ltd., mechanical ven tilation; W. Gregory and Son, Lincoln, elec tric lighting; Dent and Hellyer, sanitary fit tings; Bostwick Gate Co., collapsible gates C. Roberts, 4, Hungate, Lincoln, ornamenta gates and railing. Earle's Cement, supplie by G. and T. Earle (1925), Ltd., Wilming ton, Hull, was used throughout the buildin

Cemetery Chapel and Crematorium, Ipswich

Plans for the erection of a new cemeter chapel, in which a crematorium will be in corporated, have lately been approved b the Ipswich Burial Board. The chape which will have a belfry tower and will b built of red brick with stone dressings an a roof of sand-faced tiles, will follow tradi tional cruciform lines, with a carriage por and main entrance at the west and the cat falque at the east. The arms of the cross ar provided by a vestry for the clergy an ministers on the northern side and a waitin room for mourners on the south, both bein approached by separate entrances and wit access from them to the main building. A organ loft and choir are provided in the we end, and the seating in the chapel is arrange face to face on the college principle. The will be a gas incinerator, with a vent to th belfry tower, but no chimney shaft.

Mr. J. A. Sherman is the architect.

THE SUN BABIES' DAY NURSERY, HOXTON, SHOREDITCH, N.

his nursery has been erected in memory Muriel Viscountess Helmsley, and was ially designed on open-air lines, so as catch every glimpse of the sun. The ding stands on a freehold site at the ner of Felton-street and Norris-street, looking the Regent's Canal, and com-nds a fine position for a building of this l in the heart of one of the most over-vded districts in the north-east end of ndon, where there are hundreds of children o are too young to go to school, and ose only playground is the streets, and ose mothers are out at work or unable to nd to their children from other causes. ents can leave their children here for a ll sum. The children are well cared for, ght cleanliness and obedience, and made ppy by cheerful surroundings and games. For twenty years the Douglas Day Nursery been working in Shepherdess Walk, Hox-, but the premises were far too small. The dren crowded to come in, but could not be taken. The new building is constructed of brickwork, rendered on the outside, and has two open-air nurseries 50 ft. by 14 ft., open on one side with a glazed canopy over, one for infants (children from a few weeks old) and one for "toddlers" (children 1 five years of age). Here they are taught on nursery and school and Montessori lines. The building cost to erect approximately £7,000, excluding equipment, etc., and was erected under the supervision of the Viscountess Erleigh and her Committee. The Ministry of Health gave a grant, as also did the Borough Council of Shoreditch.

The building is designed on hospital lines, having simple mouldings, rounded corners, coved skirtings and cornices and every point of hygiene has been studied. There is separate lavatory accommodation for the children on the ground floor and a model wash-house equipped with up-to-date appliances. There is accommodation for 100 babies and sleeping accommodation for seven probationer nurses. There is a large room on the first floor equipped with a sunlight lamp, where artificial sunlight treatment is given. The heating throughout the building is by gas radiators, as is also the cooking apparatus. There is a paved playground at the south end and a lawn in the centre between the two nurseries. The building, which was officially opened by Princess Mary Viscountess Lascelles, on May 4, has been designed by, and erected under the supervision of, Sir Charles T. Ruthen and Co. (the late Sir Charles T. Ruthen, O.B.E., F.R.I.B.A., and Messrs. Percy J. Williams, L.R.I.B.A., and Cyril E. Morris, architects and surveyors, of 44, Bedford-row, Holborn), who acted in the capacity of honorary architects.

The general contractor was Mr. William Simms, of Commercial-road, E.1, and the following were sub-contractors:—John R. Venning and Co., hot-water installation and sanitary fittings; the Novocrete Co., Ltd., novocrete paving; Ellis Partridge and Co., Leicester, slating; the Brentford Concrete Construction Co., Ltd., patent flooring; the Eastern Armature Winding Co., electric light installation; the London Gardens, Ltd., garden lay-out.

PARTHENON STUDIES.

By W. R. LETHABY.

IV.—THE LAST HUNDRED YEARS.

All my archæology was taught me by Germans. Dörpfeld was my most honoured master.—MISS JANE HARRISON.

IN the notes for my last part I had ventured to suggest that in the "Ode on a Grecian Urn" Keats referred to the Parthenon frieze in the lines about the mysterious priest leading the "heifer lowing at the skies." As, however, I could not see any confirmation in Sir Sidney Colvin's account of the poem, I omitted it. In Miss Amy Lowell's big study of Keats, more recently published, I find my view anticipated. "On a day early in March [1817], Haydon took Keats to see the Elgin Marbles. The effect of this view of the marbles was to leave Keats in a state of mind bordering upon stupefaction." She calls this "the mood of the marbles," and says that he received the inspiration for the ode from seeing them. He immediately wrote two sonnets, one to Haydon and the other entitled, "On Seeing the Elgin Marbles for the first time."

My spirit is too weak—mortality
Weighs heavily on me like unwilling sleep.
. . . . . .
That mingles Grecian grandeur with the rude
Wasting of old Time. . . .

About the ode, Miss Lowell writes thus:—"The first thing to be noted about the Grecian Urn is that the inspiration came from the Elgin Marbles, from that part of the frieze of the Parthenon which shows the cattle being brought to the sacrifice. . . If Keats had called his poem Ode on the Elgin Marbles, the title would have been ugly. . . . . The word urn is attractive. With the idea of attributing this bas-relief to an urn, the difficulty was solved. . . . . Keats had spent two years intermittingly gazing at the Elgin Marbles." Further, it has to be observed that the title "Elgin Marbles" had already been used up for the sonnet.

"The little town mountain-built with peaceful citadel emptied of its folk this pious morn," can hardly be any other than Athens and the Acropolis. Finally, it must be noted that the famous end lines of the ode just condense the thought about Greek art of the time to which I have called attention.

"Beauty is truth, truth beauty—that is all
Ye know on earth, and all ye need to know."

. . . .

In 1830, by the second protocol of London, Greece was declared an independent sovereign kingdom. About the same time the Elgin Marbles were rearranged in the new galleries at the British Museum. It seems to have been a moment of swift change. The old epoch of amateur connoisseurs was passing in Britain, and the lead in classical archæology was to be ceded to German scholars. Still, good work continued to be done by independent students.

In the *Penny Magazine*, 1832, an illustration of "the New Gallery of Athenian Antiquities" was given, with a short account of the sculptures written in the same general mode of thought as was the appreciation of Sir Benjamin West. I quote some of it to show that, after all, the dwellers in "the foggy city by the Thames" at this time had a theory of criticism and some mind of their own. "This wonderful collection may at first sight appear uninteresting. The figures have been sadly mutilated, and the surface of all is so corroded that the care with which they were finished can no longer afford delight. But quite enough remains to show the extraordinary genius by which these great works were created. Let the spectator visit the gallery again and again till the real character of these immortal works has taken possession of his mind. The union of nature and ideality is the highest quality of art; the common defect being an undue inclination to one of these to the neglect of the other. An exclusive attention to *nature* in the common acceptation of the term degenerates into vulgarity, while the attempt to refine by an ideal standard gives rise to *conventional style or manner*—the grave of excellence. It is the fate of all excellence to suffer from unskilful imitation, and the calm, elevated beauty of the antique, when transmitted by inferior practitioners, assumes the aspect of frigid and wooden inanity.

"We are certain that no one possessing a tolerable natural taste will repeat his inspection frequently without becoming sensible of their beauties. For the appreciation of those works no technical acquaintance with art is necessary. They are executed in that style of consummate mastery which discards the parade of recondite knowledge and addresses itself to the spectator in the broad and general language of nature. It is not only in the human figure that profound skill is evinced. When we look at the horses in the frieze we are tempted to think that beautiful animal has never elsewhere been adequately represented. The horses of the Elgin frieze exhibit throughout the *generic* character of the animal; and it is impossible to look on the succession of groups in every variety of action without feeling animated and exhilarated, as if the procession were really passing before us. The most casual observer might be struck with the grace of the riders, who seem formed 'to witch the world with noble horsemanship.'"

From internal evidence it appears that the writer of this understanding and most admirable essay, which is so different from the muttering and maundering of much art criticism, was Sir Henry Ellis, who in 1833 published *The Elgin Marbles*, two delightful little volumes in the Library of Entertaining Knowledge series.

John Pennethorne in 1832 observed the curvature of the horizontal lines of the temple. In 1834 he took models (moulds?) of the mouldings, and in 1837 he returned to Athens once more to complete his observations, of which he published an account in 1844. In the meantime, an outline of Pennethorne's investigations was given in the second edition of Leake's work, 1841.

"Mr. Pennethorne, who during his residence in Athens directed his attention to principles upon which the Athenians proceeded, found the upper step of the eastern front of the Parthenon to form a simple curve rising three inches in the centre; that higher in the front the curve changes its character; that in the architrave it becomes a curve of double curvature, and the same in the cornice with an increase of curve."

"The entasis of the columns so remarkable in the Doric of Corinth and Sicily, which is so much reduced that its existence was doubted, has now been proved to exist. The fact has been ascertained that the pavement on which the columns stand is depressed at the four corners, [a curve like] an arch in the direction both of length and breadth [of the temple]. The columns of the peristyle incline inwards. We may conceive this inclination to have been a better security against earthquakes. The curvature of the pavement, we may conclude, had reference only to appearance."

In 1878 Pennethorne published his large work, *The Geometry and Optics of Ancient Architecture*. His main view was that modifications of straightness were "optical corrections."

In 1845 Mr. George Knowles was at work in Athens, and a view of the city from his drawings was issued with this date. Near the end of this year he wrote to Donaldson, (for report to the Institute of Architects) on recent discoveries at the Parthenon. "Most of the fragments of the interior have now been removed. The interior now offers greater facilities for imaginings on its decoration. There are evident traces of Doric columns with marks of their fluting visible on the floor. The diameter has been 3 ft. 7½ in.; and on both sides it is clear there have been nine, counting from t east end, at which there is the remnant a pilaster the breadth of the diameter (*The Builder*, 1846.) Later in the sa year there was a note in *The Builder*, pr ably from Knowles, saying—"Seve triglyphs have been discovered which, cording to their size, must have belonged the inner row of columns. That these w of the Doric order was ascertained so years since by the impressions found on t floor of the Cella" (p. 425).

The debris and fragments which w cleared away from the interior at t time must have included the walls of Turkish Mosque which occupied the ce when Woods drew his plan. Knowles m a very accurate new plan, which was p lished with the date 1846. As Michae says, we are indebted to it for several observations. The traces of columns on paving of the cella showed that they h been more closely spaced than Woods Cockerell had thought. They were ab 3.656 in diameter and had 16 flutes. In plan Knowles put a square pier at the w end of each longitudinal row of colum and nine columns between these suppo square piers and the responds on the wall. We know, however, that Woods observed traces of columns rather t square piers at the west. Knowles and P rose seem to some extent to have wor together on the Parthenon, and Know plan was also included in Penrose's g book on Athenian Architecture. Penr on reconsidering the plan and the quest of square or round piers at the angles the internal colonnades, decided, altho these square piers had been his own sug tion, that the evidence of Woods Cockerell proved that there were, in f circular columns at the angles—"In sequence of these two authorities I h substituted the round for the angul And we can do no other. The inte plan of the Parthenon partly recovered the Elgin Expedition and made known Woods and Cockerell, was fully made and published by Knowles in 1847, and Penrose in 1851.

Neither Woods nor Knowles is ever tioned, and Penrose's special considera of the angle columns in the interior se to have been forgotten.

In Miss Jane Harrison's delightful on Athens we read, in regard to the of the Parthenon, "It remains to fix place where the statue stood. . . It be seen how the image gains by coming into the nave. It could thus be exam from either side and from the back . like the Olympian Zeus that set Dr. D feld on the true track. . . . There distinct gain in advancing the figure ne to the entrance. If we give up, as Dörpfeld does, hypæthral and other ligh save through the door, it was well that sight that every worshipper should should not be too remote. It would . . . . the radiant goddess herself was light thereof. . . . The ground plan is g in accordance with Dr. Dörpfeld's rest tion (1881). . . . For the view of ligh solely through the door I am indebted paper by Dr. Dörpfeld, 1889." The Br Museum "Guides" to this day give plan as Dörpfeld's, ignoring Penrose Knowles.

Francis C. Penrose made great advanc Parthenon scholarship about the middl last century. After graduating as a se optime in 1842, he was elected a "Tr ling Bachelor" upon the Week's endown and travelled during three years in and Greece. The results of his resea made at that time and on subsequent sions were published in his monume work, *The Principles of Athenian Arc ture*, which he brought out for the Dilet Society in 1851. "The society had av themselves of his offer to pursue the in initiated by Wilkins and taken up by James Pennethorne. They furnished Penrose with the means of going to A with his improved instruments, and testing the theories in respect of del

es and variations in the lines of the henon." Michaelis says of his work: e English architect, F. C. Penrose, in ection with G. Knowles, began in 1846-7 rvey the Parthenon and Propylæe with nparable accuracy. Penrose's minute surements created the greatest interest much as he confirmed the horizontal es of the steps and entablature of the henon which had first been observed by countryman, J. Pennethorne, in 1837." article in *The Builder*, 1877, which s to be by Watkiss Lloyd, speaks of rose's book as "one of the most valu- and thoroughly worked-out archi- ral treatises in the language." Penrose d the traces of painted decoration on temple with great care, and his volume chief authority on this as well as on dimensions, curvatures and inclinations he work. Donaldson had "remarked on the underside of the mutules" about (Wood's Letters, II, 238).

R. Ricardo, the father of Mr. Halsey rdo, worked at Athens in 1846-7, and w of his drawings are now in the Greek artment of the British Museum. W. kiss Lloyd, an earnest British student reek antiquities, made several advances Parthenon studies, but he never seems ave been mentioned in official works. wrote on the marbles from Xanthos in , and in 1847 he gave an excellent unt of the representation of Athena's est with Poseidon in the west pedi- t of the Parthenon. "The action of idon is a recoil, the expression of the re is that of surprise at a sudden check. ena rushes forth, crossing his path. opposed front and extended arm of ena carry the expression of warning k or barring the passage." He replaced ig piece of a leg of Amphitrite, and s, as he said, "transformed a torso a statue." A large fragment of a ed woman, also on the right side of the t pediment, was, he said, the right thigh ier than the left, as had been supposed. he mistake has arisen from the slope of seat, causing the knee to be much ated above the lap."

le noticed how the drapery of the seated nan next to the chariot of Poseidon moved if from a breeze playing at her feet," a ion seized by Furtwängler, and leading to his identification of the figure as ithyia. The "excited action" of all the res in the west pediment was also ob- ed. He assigned the noble Laborde head Amphitrite, a view that I am inclined to k true, although there is no sufficient of. and Sauer attributes it to another re.

Watkiss Lloyd also fitted a fragment of a ent, 18 in. long, to the lump on which figure now accepted as Cecrops is seated. his was a most important discovery con- ing Leake's suggestion that the figure indeed Cecrops, being the only positive ntification of a secondary figure that has n made and leading surely to an inter- tation of the whole composition. The re and its companion before this time officially described as "a mutilated up, supposed to represent Heracles and be," while another torso was named rops (Handbook 1851). Lloyd could not his fully demonstrated discovery recog- ed. and protested against the "lack of idour" shown. He noticed "the sudden rt" of the female companion of Cecrops. d that her left knee was raised from the und.

For restoring the centre of the eastern pedi- nt he made use of the Rondanini relief of is and Hephaistos, a replica of the fuller drid relief, which is now generally epted as an echo of the central composi- n of the pediment. He selected what pears to be the right type of Athena for s position and placed next to her a nude le torso, which he restored as facing the tre, but moving to the right with both ns thrown up in surprise. At Lloyd's gestion the cast of the figure of Selene was t put in its right place, April 30, 1860. ny minor suggestions of value were made by this acute student, and he called attention to the fact that "the marbles exhibit traces of the drill so used as to baffle explanation of the mode of its astonishingly effective application." He observed of Demeter and Persephone in the east pediment that "Pheidias found it desirable to make these two figures as large as possible, in order to balance the Fates. In consequence, he kept parts large while he abbreviated those that were less expressive."

Of the middle figure of the three "Fates," he observed, "It is clear that her right hand must have held in the delicate way so often seen on Greek monuments, the fold of her peplus, the position of the robe spreading over her back requires it to be so sustained, and on the shoulder folds are interrupted by the fracture."

I worked this out independently many years later, and thought I had made a discovery, as it was not mentioned in official books.

The work of Leake and Lloyd in explanation of the sculptures led up to Furtwängler's scheme of explanation of the Western pediment, which in the main must be accepted, however long we may delay, because it is simple and adequate, and there is really nothing which anybody believes in to set in its place. This scheme to which we shall return should be called the Leake-Lloyd-Furtwängler theory.

The job-lot of names given to the figures of this pediment at the museum seem to be long out of date; they should be defended or abandoned.

Lloyd also noticed several points in regard to the further explanation of the frieze. He saw that the sceptre of Zeus must have been prolonged downwards in bronze and upwards by painting. The three drilled holes for an attribute that had been carried by the goddess on the other side of the centre show "her symmetrical arrangement with the sceptred Zeus." A pair of the gods on each side are separated from the others. The boy near the priestess at the centre was "a consecrated temple acolyte."

"The more the frieze is studied the greater will be the admiration of the genius displayed in plan, invention, drawing, and execution. Whatever inequalities there are appear due to differences of execution, not to inferior design. . . . I do not doubt that the background was coloured blue, and this could carry off the metallic ornaments."

"The copies of the frieze round the Athenæum in Pall Mall afford the best opportunity for studying its design. It was from observation of the copies that I pointed out the order of the cavalcade, as following on in ranks of six or eight horsemen abreast. The broad, smooth surface of the outer horse gives rest to the eye and marks the sequence. . . . There seems scarcely any limit to the number of superimposed masses which the sculptor was able to comprise within the relief of his rigorous two inches. It is by the same principle that the gods (of the east frieze) are seated four abreast and two abreast. . . . Compared with the compositions which once filled the pediments, the frieze, unapproachable as it may be, is after all only a facile sketch for delegated execution of the sculptor who wrought the all-majestical Fates."

We thus owe to Watkiss Lloyd the recognition of "the ranks of six or eight horsemen abreast," which has since been elaborated and worked out in diagrams in museum publications, and in Collignon's fine book on the sculptures.

In 1854 he wrote in association with Owen Jones, *An Apology for colouring the Greek Courts at the Crystal Palace*, in which he recorded his views regarding the colouring of Greek architecture and sculpture.

Lloyd was the author of a scheme of mathematical proportion applied to the Parthenon, which was incorporated by Penrose in his big work. Lloyd brought forward his theory in 1859 in a paper at the Institute. It was endorsed by Penrose in a paper of 1877 (*The Builder*, February 10). That a considerable mathematician, the accurate measurer of the building, should have accepted the theory is remarkable, for usually the propounder of a scheme of proportions is the only one who can believe in it.

Lloyd seems to have been the first to elucidate an important Greek inscription, found at Lebadea, which is now celebrated as a building specification and contract. (*The Builder*, 1877). His article is unsigned, but Penrose later referred to it as by Lloyd, who, about 1870-80, seems frequently to have written for *The Builder*. The opening leader for 1877 must, I think, be his.

This essential document for the study of any Greek building is now always referred to in Choisy's later version, and Lloyd's, which is vivid and convincing, has been neglected into the forgotten. I wish some student would compare both versions, and those with the admirable study of the Parthenon accounts recently made by Mr. Arthur Smith.

Watkiss Lloyd was elected to the Dilettanti Society in 1854. In the history of that body he is described as "A gentleman of means who enthusiastically devoted his life to the study of ancient art, antiquities, and literature and was the author of a large number of treatises, published and unpublished, as well as two remarkable historical works, the *Age of Pericles*, and the *History of Sicily*. Until his death in 1893 Mr. Lloyd was one of the principal advisers of the society in their archæological undertakings."

Of all our English students of Greek art Watkiss Lloyd probably did the most to explain the Parthenon sculptures. If he had been a German professor his work would be constantly acknowledged. As it is he does not seem to have a place in the *Dictionary of National Biography*.

One of the last architects learned in Greek antiquity was Edward Falkener, author of an excellent book on Ephesus. In his *Museum of Classical Antiquities*, 1851-60, he published a restoration of the eastern pediment of the Parthenon. The central group consisted of Zeus and Athena, Hephaistos and Nike. He postulated an enthroned Hera, and placed a figure of Hermes next to the great triad on the right.

He systematically examined vase paintings of the Birth of Athena, and showed that in about thirty representations, Eileithyia occurred no less than twenty-two times, Ares twelve, Hermes ten, Apollo nine.

Charles Newton, a delightful old-school Englishman, about 1860, found the small marble copy of Athena's shield in Lord Strangford's house, and obtained it for the museum. I remember hearing him lecture at the Royal Academy about 1880, and that he remarked "When Greece and Rome are exhausted, we may yet make discoveries in the cellars of the British Museum."

Newton seems to have been the first to use photography for recording the results of excavations at the Mausoleum in 1857. He was a favourite with foreign scholars. Michaelis speaks of him as "A man combining great learning and a keen sense of art, with a great persistent energy."

Dr. A. S. Murray succeeded Newton at the museum, and valuable work was done in his time in the preparation of the Catalogue of Sculpture. In 1903 he published a volume on the Parthenon sculptures. Generally, this was a period of waiting on Germany to advance theories to which we might try to object for a time before adopting them.

I must not venture to speak of the admirable work done more recently by Mr. Arthur Smith. While the marbles were in his custody he made many attachments of fragments and excellent rearrangements. He edited the big and indispensable *Sculptures of the Parthenon*, issued in 1910, and only a few months ago published a most valuable study of the building accounts of the Parthenon, based on German and American research.

A new period of Parthenon studies was opened by the publication in 1871 of the comprehensive and "classic work" of Michaelis. Not one of his own new identifications of the figures in the pediments or the eastern frieze seems to hold good, but he first explained the subject of the north metopes, as relating

to the Trojan War, and he made several piecings together of fragments, and rearranged some of the slabs of the frieze.

A valuable contribution was made by Bruno Sauer in a minute examination of the marks on the pediments. Furtwängler followed by extending Leake's theory of interpretation of the left side of west pediment over its whole field.

1882 Davidson's pleasant little study of the frieze appeared, and the next year was published Ferguson's more ambitious book, which was mainly devoted to sustaining the lost cause of hypaethral lighting. Sir James Frazer's *Pausanias*, T. W. White's *The Opisthodomus*, and Miss Jane Harrison's *Monuments of Athens*, 1890, must also be mentioned.

. . . .

This account of British study of the Parthenon, is only an outline; if it were gone over again it could be filled out and corrected. We have never cared to recognise the work of one another, and thus we have lost cohesion and momentum.

As showing how we quite unthinkingly neglect native students, I may refer to the fact that the British Museum Catalogue of Sculpture, issued by Dr. Murray in 1891, has a "Bibliography of the Parthenon," in which the works mentioned are all foreign, with the exception of his own book on Greek sculpture; old works like Stuart's *Antiquities*, and Miss Harrison's *Athens*, which is cited for Dörpfeld references. The plan of the Parthenon adopted was that of Michaelis, which placed the statue away in a recess. The *Sculptures of the Parthenon*, 1910, begins with "a list of works most frequently referred to": these are five German, two Official, one Stuart's; the plan given is that of Dörpfeld. The way in which we treat our own workers reminds me of the story of Mr. F. W. Fowle, who wrote a book on the Poor Law. In a second edition, 1893, he gently complained that not only had it been appropriated in Germany, "but translated back into English with a preface by Professor Henry Sidgwick, containing the intimation that an urgent English need had been supplied in a thorough piece of German work."

Danish Architecture.

We publish in this issue a selection of illustrations from the Exhibition of Modern Danish Architecture, which is now being held at 6, Queen-square and at the Architectural Association in Bedford-square. A notice of the Exhibition, which closes tomorrow, was given in our last issue.

Bournemouth Pavilion.

This building is now approaching completion from the designs of Messrs. Home and Knight, AA.R.I.B.A. The competition drawings were illustrated in our issue for July 6, 1923.

New County Police Station and Court-house, Bury.

This building is being erected for the Standing Joint Committee of the Lancashire County Council on a site in Tenterden-street, Bury, overlooking the playing fields of the Bury Grammar School. The main elevations will be faced with "Old Tea-Pot" rustic bricks, with stone dressings from the Stancliffe Estates, Darley Dale. The accommodation in the main administrative portion of the building comprises, on the ground floor, offices for the superintendent, inspectors, detective staff, and general clerks, with six cells. On the first floor there is a spacious court room, with retiring rooms for magistrates and lady magistrates; magistrates' clerk, solicitors and witnesses' rooms, etc. Living quarters for the superintendent, one inspector and two married constables are also provided, with divisional parade and recreation rooms and garages.

Mr. Stephen Wilkinson, F.R.I.B.A., is the County Architect, and the contractors for the work are Messrs. E. Taylor and Co., Ltd., of Littleborough, Lancs.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XX

By H. V. MILNES EMERSON, A.R.I.B.A.

SECTION 73 (Continued).

(4) No part of the woodwork of any shop front shall be fixed higher than 25 ft. above the level of the pavement of the public footpath in front of the shop. No part of the woodwork of any shop front shall be fixed nearer than 4 in. to the centre of the party wall where the adjoining premises are separated by a party wall or nearer than 4 in. to the face of the wall of the adjoining premises where the adjoining premises have a separate wall unless a pier or corbel of stone brick or other incombustible material 4 in. wide at the least be placed as high as such woodwork and projecting throughout 1 in. at the least in front thereof between such woodwork and the centre of the party wall or the separate wall as the case may be.

Note.—Pilasters and corbels need not be fixed provided the woodwork of the shop front (including the fascia and cornice) is not less than 4 in. from the centre of the party wall, etc. The minimum thickness of the pilaster and corbel when used is 4 in., and they can be made of metal if desired.

In Subsection 3. Although the shop front can project beyond the front of the building, it must not project on public property, excepting the cornice.

(5) In a street of a width of not less than 40 ft. or to a building the front wall of which is not at a less distance than 40 ft. from the opposite boundary of the street bay windows to dwelling houses may be erected on land belonging to the owner of the building notwithstanding the provisions of this Act relating to buildings beyond the general line of buildings in streets provided that such bay windows :—

(a) Do not exceed 3 storeys in height above the level of the footway;

(b) Do not project more than 3 ft. from the main wall of the building to which they are attached;

(c) Do not project in any part within the prescribed distance of the centre of the roadway;

(d) Are in no part nearer to the centre of the nearest party wall than the extreme amount of their projection from the main wall of the building to which they are attached;

(e) Do not taken together exceed in width three fifths of the frontage of the building towards the street to which such bays face;

(f) Are not constructed upon any part of the public way or upon any land agreed to be given up to the public way; and

(g) Shall not be used for trade purposes.

Bay windows to which the foregoing rules do not apply shall not be erected without the consent of the Council after consulting the local authority.

Note.—The maximum projection of 3 ft. does not apply to buildings that are set back from the general line of buildings in the street, i.e., the building line. The front of the bay, however, must not project more than 3 ft. beyond the general building line. Assuming you required a bay 5 ft. deep the front line of the building would have to be set 2 ft. back from the general building line.

In new streets if the front of the bay windows is taken as the building line, the bay windows can be made more than 3 ft. deep without the consent of the Council. If, however, the front wall of building is taken as the building line the bay windows cannot project more than 3 ft. without the consent of the Council. On new estates where say the main wall or ultimate building line is 20 ft. back and bay windows 4 ft. deep are to be built the building line shown upon the plans submitted should be 16 ft. then the 4 ft. bays can be built without consent. If, however, the ultimate building line is shown at 20 ft. the bay windows can only project 3 ft. without consent.

Bay windows in housing schemes can built with frames of soft wood, and with the prescribed distance of the party wall, et upon application to the Council.

(6) In a street of a width of not less th 40 ft. or to a building the front wall which is not at a less distance than 40 from the opposite boundary of the street p jecting oriel windows or turrets may be c structed. Provided that:—

(a) No part of any such projection exte more than 3 ft. from the face of the fr wall of the building or more than 12 in. o the public way;

(b) No part of any such projection be l than 10 ft. above the level of the footway the street;

(c) No part of any such projection (wh it overhangs the public way) be within distance of 4 ft. of the centre of the near party wall;

(d) On no floor shall the total width any such projections taken together exc three-fifths of the length of the wall of t building on the level of that floor;

(e) Every such projection to be construct to the sataisfaction of the District Surve or in the event of disagreement to the sat faction of the superintending archite whose determination shall be final.

Oriel windows or turrets to which the fo going rules do not apply shall not be erec without the consent of the Council af consulting the local authority.

Note.—No height is given for turrets, et these can be carried right up the facade desired. Oriel or bay windows can only p ject 12 in. over the public way. The a of the side lights to the bay window can increased by recessing the reveal into t main wall and splaying the latter.

The notes to the last sub-section apply general to this sub-section. The Distr Surveyor is entitled to special fees in c nection with oriel windows.

(7) The roof flat or gutter of every bui ing and every balcony, berandah, shop fro or other similar projection or projecti windows shall be so arranged and c structed, and so supplied with gutters a pipes as to prevent the water therefrom fr dropping upon or running over any pub way.

(8) Except in so far as is permitted this section in the case of shop fronts a projecting windows, and with the excepti of water pipes and their appurtenanc copings, string courses, cornices, fasci window dressings and other like arc tectural decorations, no projection from a building shall extend beyond the general li of buildings in any street except with t permission of the Council after consulti the local authority.

Note.—It has been held that to determi whether a projection is a structure with this section, the weight of the framewor the method of fixing and supporting sa are facts to be taken into consideration. A electric advertisement consisting of a wood case with glass front fixed to the front of building on iron brackets is not within th section. Hull *v.* L.C.C. (1901), 84 L.T. 16 L.C.C. *v.* Illuminated Advertisement C (1904), 91 L.T. 352.

The removal of reflectors hung out ov the public way cannot be enforced und Michael Angelo Taylor's Act, Section 6 Winsborrow *v.* London Joint Stock Ban Ltd., 88 L.T. 803.

Royal Institute of British Architects' Conference.

His Majesty the King has graciously giv his patronage to the annual conference of t Roval Institute of British Architects, whi will be held in London from June 20th June 25th.

TOWN PLANNING INSTITUTE

Mr. W. R. Davidge (President) took the air at a meeting of the Institute held at xton Hall, Westminster, on Friday last eek, when the subject of London Transport as introduced by Mr. W. H. Gaunt and r. Nigel Norman (Met. Railway Co.). We ve below a report of the first paper and opose to deal with the second in our next ue.

London Transport.

Mr. W. H. Gaunt said he would take up time with figures of congestion and in-ease over a generation ago, as they were conscious of it. It was housing pressure at was creating much of the transport pres-re, and a pressure at peak times and upon public that could ill afford alternatives nich cost a fraction more. People are reading themselves further out each year residence and visiting each other more. Every word in Mr. Culpin's paper upon centralisation was fully justified, and he ly wished to emphasise that if industries uld be induced to decentralise even into burban London their action was only pos-ble and successful if every local authority ould do more than its best in both housing d traffic stimulation to deal with the new nditions. They were all agreed that pres-re in London could only be relieved by de-ntralisation, but not every local authority outer London conceived it their duty, once industry would move out, actively to eate housing and traffic facilities, or to be volved in the cost of relieving congestion the centre.

In goods transport as well there had been anging methods of trade which had induced riding habit in goods as well as passengers, nd which the railway companies could not aim to have lost, for they never enjoyed it. arious counts and reports established the tatement that by weight, at least, most roads f the important thoroughfares nature carried ow 85 to 90 per cent. of their traffic by otor traction. And it was noticeable that owever desperate might be the congestion n most thoroughfare and traffic junctions be periods had a distinct limit in time with reat regularity daily. Up to 9.30 a.m. and fter 6 p.m. there was no difficulty at most f these; in many cases the congestion was ven less limited in period. The horse-drawn 0 or 15 per cent. remainder of the traffic as the very serious congestor of the whole, uite out of proportion to its volume or ur-gency, by its inability to keep pace or to ecover pace from stoppages at junctions. In-onvenient as it might be to the few who ould not readily change from horse to motor raction, he believed the time was now at and when, adequate notice having been given, horse-drawn traffic must be gradually rohibited along scheduled main thorough-fares during certain hours of the day, and ultimately from crossing them. Sandwich-men, street trading, stopping for unloading eyond a limited period were all subjects for restriction now urgent, together with more ne-way streets.

More contributory factors in congestion han the limited width of streets were at heir junctions and crossings, and no capital ities of the world had so many intersections f streets per mile as London and the English ities. As they could not now alter this eature, gyratory traffic must be provided or at every possible point, it having proved ts value. He believed that the recreation f circular building frontages at many points for the present square corners would involve, n balance, no less to the local authority aking it in hand comprehensively.

The time was now ripe for some important crossing to be experimentally subjected to Sir Alfred Yarrow's suggestion of an over-bridge taking one stream of traffic over the other. His selection of Oxford Circus for treatment was a little unfortunate, but there were other spots where amenity and frightful shopping values did not present such diffi-culties in proportion to the amount of traffic dealt with, and where the amount of traffic wishing to turn the corners in proportion to that proceeding direct ahead was small. Anyhow, both gyratory and Yarrow systems were discounted if they were only adopted at isolated centres, as a block or clearance at one point reflected upon the next junction point.

The next relief of pressure would be by the traffic pool, and sufficient progress seemed to have been made to indicate legislation next autumn. This would eliminate from the streets some percentage of the competitive un-essential vehicles of the 'bus combine and its allies, the London County Council and other tramways, and the tubes which were initiated before the possibilities of road traction were so fully developed.

These means of relief had so far involved little outlay of public money which would not be recovered within reasonable time. But within the items of moderate outlay, other than street widenings, one would include the need for underground pedestrian cross-ings. He believed an attractive one has yet to be built, but provided with transparent street paving to banish the tunnel feeling, and denuded of lavatory surroundings, and with a slope entrance in line with the direc-tion of the pedestrian, they should be practi-cal aids to remove the blocks caused by holding up road traffic for pedestrians to cross, and again could be enforceable only in limited hours. But these palliatives would be trifling unless some better bridge and arterial road provision was ensured, and per-haps not everyone was familiar with the present position at a glance of new projected schemes laid down in the developed areas before a brick in the structure of regional town planning had been laid, but none the less wisely laid.

The five leading thoroughfare provisions urged by the Traffic Advisory Committee were :—Victoria Dock to City Arterial Road; Cromwell Road and Western Exits; Berkeley Square and Mall new street; Kensington High Street widening; Whitechapel clearance; with a secondary recommendation in favour of the Lower Thames Tunnel. The same committee recommended the creation of alternative routes between the following points by sundry widenings and minor clearances :—Bayswater to Islington and Hackney; Hyde Park Corner to Vauxhall; Chelsea to Westminster; Picca-dilly to King's Cross; Tottenham to the Docks. His only comment on this excellent programme was the omissions of reference to Euston and Marylebone Roads, and the relief which widening, wholly or in part, would be to the City and Docks traffic to W. and N.W. London. He believed the local boroughs through which it passed had years ago made the way easy by acquiring frontages or fixing of building lines for the L.C.C. to take up this project.

Then summarising the report of the River Bridge Commission, the following works ap-peared likely to fructify :—Reinstatement of Waterloo Bridge; abandonment of St. Paul's Bridge Scheme; new high level bridge—South-wark Street to Holborn Viaduct; new road and rail bridge—Hungerford Bridge to Cavell Statue, and set Charing Cross Station back; and tap Waterloo Station and Elephant and Castle area; improve Vauxhall Bridge Station exit; rebuild Chelsea Bridge for road and foot; rebuild Albert Bridge for road and foot; rebuild Wandsworth Bridge for road and foot; widen Putney Bridge for road and foot; rebuild Hammersmith Bridge; new bridge Hampton Court; new bridge Chertsey; new bridge Richmond; improve Woolwich Ferry; new Dartford to Purfleet Tunnel. Unfortunately, while no serious criticism had arisen of these projects, both road and river, and the Government had in substance accepted them, there was much scope for dis-claim of financial responsibility between them-selves and the L.C.C. and progress was by no means sure. Two points he wished to emphasise. The first was the need for such artistic restraint as would ensure a clear span bridge, if not from bank to bank, at least for a large proportion of the navigable stream. A comparison with the spans over the Rhine or in the U.S.A. of all their modern bridges indicated how much the Thames river traffic could be developed given an equal chance. Every extra thousand tons carried up and down the river saved wear and congestion of the Dock and Riverside road routes through and across London. The other point was that there is a vast tonnage of goods travelling between the Midlands and London Docks which could not avoid tran-shipment at some point from the narrow boats on the narrow Midland canals to the wider river barges in the Grand Junction Canal, and the Thames, as the former boats were not capable of weathering the Thames. This transhipment being a serious drawback, traffic was brought by road or by rail, and fre-quently the rail did not serve the dock so conveniently. If only some method of coup-ling together two narrow boats, or floating them into a larger pontoon could be devised, some congestion in road and rail in London would be avoided. It was often said that these canals might be more used for coal traffic into London from the Midlands, but the difficulties of congestion round a canal basin at the Collieries and in London pre-cluded this.

But he must turn to the arterial road aspect of transport development. They were familiar with the now completed Southend artery, the Great West Road, and the Folkestone artery. Approaching completion were the roads from North London to Hat-field, the bye-pass of Watford, and the Cam-bridge Road from Tottenham. Of the 18 miles of the near circular road round North London 10 miles only were complete. There was a south circular projected road yet un-built All these roads were excellently planned, but falling far short of their real utility through being broken in continuity or approach. Consequently they did not in-vite traffic to flow easily into them, and very litle had been done in publicity to invite drivers to find them and use them. The Rent Restriction Act, involving a diffi-culty in distributing occupiers, was indirectly causing a sterilisation of development in traffic relief, as no local authority could attempt to dislodge occupiers of property which was standing in the way. He suggested that as for distances up to 20 miles from London, except for some dock and bulk traffic, the usefulness of railways for goods delivery had materially diminished. But for passenger transit, even with all modern road traction, there was no such efficient or cheap a reliever of London's congestion as the railway service beyond the radius of the tube area.

It was largely a question of moral courage and foresight and finance. There were more schemes referred to in this paper than would fructify in ten years, and all of them were advisedly laid down so that whatever the regional planning of the next ten years might alter, their wisdom would be justified. They needed courage to push forward the traffic reforms referred to in the earlier part of the paper without much finance. Then to insist upon the energy of finance for the bridge and road developments already referred to. Meanwhile land should be earmarked for a second and outer ring road, fifteen or twenty miles from the centre, so that as more road traffic arose, the dock and East and West factory areas could be served without going even into the London suburbs, which would be congested themselves in a few years' time. Anything so short-sighted as the divergence of funds from the Road Fund into general purposes spoke little for the nation's common-sense. What would have been less stupid would have been to provide judiciously therefrom cheap or free capital to any railway development which would re-lieve London, either by electrification, or coupling up tubes to suburban extensions, or relieving an impossible bottle-neck outside a London terminus. Always provided it was for a decentralisation purpose, he could see no iniquity in helping either road or rail out of such a fund.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Boarding School Required.

SIR,—I have a son of 14, and wish him to be educated towards entering my general building business. I am looking for a boarding school with a helpful commercial side. Right training, rather than the question of is the end in view. Suggestions would be welcomed.

BOURNEMOUTH.

Timber-built Staging.

SIR,—Would any reader please give me sizes of timber for a timber-built staging capable of carrying 400lbs. to the square foot? The staging is for the storage of grain in an existing store 30 ft by 100 ft. The present floor is of earth and the new staging is to be 3 ft. high.

ANXIOUS.

Definition of Bressummer.

[REPLIES TO "ENQUIRER," MAY 27.]

The London Building Act, 1894, definition of bressummer is as follows:—

(7) The expression "bressummer" means a wooden beam or a metallic girder which carries a wall. A bressummer can be of any length.

H. V. M.-E.

SIR,—It may interest "Enquirer" to know (although it does not answer his question) what T. N. Philomath says about bressummer in his Builder's Dictionary of 1703.

"BRESSUMERS.

"In an timber building, are pieces into which the Girders are framed, in all the Floors, but the Ground-floor (then they call it a Cell) and Garret-floor (then it's call'd a Beam). As to their Size, or Square, 'tis the same by the Act of Parliament with Girders, which see. You must note, by the way, that I do not mean all the pieces which have Girders Framed into them (and are not in the Garret, or Ground-floor). But I mean all such pieces which are in the Exterior part of the Building whether in the Front, Flanks, or Rear of the Building; for you must note the pieces in the internal part of the Building, into which the Girders are framed, are called Summers.

"The Bressumers in London, Mr. Leybourn saith, are used to be measured by the Foot, running Measure; but whether he means only for the Work, or Timber, or both, I do not know. Now Com. Comer saith, That Bressumers, in London are valued by the Solid Foot, if of Oak 3s. per Foot, if Fir, 2s."

A. C. HUNT.

Wood Fires.

[REPLY TO R.E. MAY 27.]

SIR,—Though the soot from a wood fire is probably more tenacious than that from a coal fire, the risk of mortar being pulled away with the soot is hardly worth consideration. Unskilful sweeping is likely to damage the parging whether there is any soot in the chimney or not. Sweeps are apt to poke fiercely against any obstruction, such as a little niche in a bend, which can be more readily surmounted by gentle finesse with a continually revolving brush. This is a frequent cause of dislodgement of mortar, and the risks involved are the creation of a rough place where soot is apt to collect rapidly. I have found that the house of 60 or 40 years of age is possessed of better flues than those of to-day, and this I attribute to the old practice of parging a flue with cow dung, which is very tenacious, and will stand a chimney fire without disintegrating like ordinary mortar. Worst of all in this respect is the cement-parged flue, in which the parging powders to dust after the first chimney fire.

The only permanent cure for an imperfectly parged flue is to open it up from top to bottom and re-execute the parging in a proper manner. This is a very expensive process, and a cheaper alternative is to sweep much more frequently than usually considered necessary, when there need be no fear of danger, provided there are no open joints exposed.

VICTORIAN.

Colouring Cement.

[REPLY TO A CORRESPONDENT. MAY 27.]

SIR,—A very nice soft grey colour is obtained quite naturally by finishing with granite dust (grey in colour), generously dashed on like pebble dash, on the wet rendered surface. There is a little sparkle in the finish, which is an added beauty.

NATURE.

THE WEEK IN PARLIAMENT.

WESTMINSTER, *Wednesday.*

Government Architects and Private Practice.

Mr. Morrison asked the Under Secretary of State for the Home Department, as representing the First Commissioner of Works, whether any of the chief architects in the Commissioner's department accepted commissions in their professional capacity from individual persons or private firms; and, if so, whether he would take steps to prevent those civil servants from engaging in private practice in the future.

Capt. Hacking said that the reply to the first part of the question was in the affirmative; in reply to the second part, the First Commissioner was not prepared to prohibit such work entirely, as he considered the interests of the Department were sufficiently safeguarded by the fact that the acceptance of such commissions was only allowed on the express conditions that:—

(1) The work must not be undertaken during official hours.

(2) Name plates must not be fixed on outside offices or private residences.

(3) The use of official premises in connection with private business was not allowed on any conditions, even after official hours, and on the clear understanding that they must not interfere with the proper execution of Departmental duties.

Mr. Morrison asked whether it would not be better for the Government to pay some attention to the curtailing of this practice of civil servants accepting large commissions from private enterprise rather than to interfere with the trade union activities of civil servants.

Mr. A. Hopkinson asked if Capt. Hacking was of the opinion that an architect carrying out a contract of one or two million pounds could devote his proper attention to his duties as a civil servant.

Capt. Hacking said if it were the opinion of the First Commissioner that an architect was not able to perform his duties to the Government, he would not be allowed to accept those commissions.

Mr. Hopkinson: Is the Chemical Trust to have the use of any civil servant it wants?

Capt. Hacking: It is very difficult to curtail a man's duties when they are carried out in his own private time. We really have no right to interfere with the private time of any individual.

Mr. Morrison asked if Capt. Hacking thought that an architect who was a full-time employee of the Government had sufficient time to undertake the architectural work for a million pounds contract.

Capt. Hacking: Yes, sir; I do.

The Repairs to Houses of Parliament.

Sir B. Peto asked whether the First Commissioner of Works would publish in the form of a White Paper the opinions of the profession of architects and of the builders and masons with regard to the policy of patching the Houses of Parliament with Stancliffe stone or replacing them with Portland stone when he had concluded his inquiries.

Capt. Hacking said that the First Commissioner would consider the possibility of publishing in some form the result of his inquiries. There might be some diffidence on the part of the individuals concerned regarding the publication of their views.

The L.C.C. Subsidy.

Sir K. Wood informed Mr. Day that the London County Council would receive the appropriate Exchequer contribution under the Housing Act, 1923, and the Housing (Financial Provisions) Act, 1924, for each house erected by them and by private enterprise with their assistance, and it was anticipated that about 9,000 such houses would be completed during the financial year. In addition, it was expected that during the year about 900 tenement dwellings for re-housing in connection with Improvement Schemes under the Housing Act, 1923, would be erected by the Council in respect of which the Exchequer Contribution would be one-half of the estimated average annual loss incurred. It was estimated that the total payments to be made to the Council in the financial year 1927-28 on account of all Housing Schemes undertaken since 1919 (including schemes of the Metropolitan Boroughs under the Housing Act 1919), would amount approximately to £570,000.

Condemned Houses.

Mr. Chamberlain informed Mr. Day that according to the Annual Reports of Medical Officers of Health for the year 1925, the latest date for which information was available, 14,035 houses were reported in that year as unfit for human habitation in England and Wales.

A Municipal Question.

Mr. T. Williams asked the Minister of Health whether he had received any communication from the Conisborough U.D.C. relating to the disqualification of a councillor from voting or speaking as such, provided he had received a subsidy and an advance on mortgage under the Housing Act, 1923; and, if so, would he state the nature of his reply and what action he intended to take to remove any doubt that might exist by virtue of section 46 of the Local Government Act. 1894.

Sir K. Wood said that the Minister had received the communication mentioned, and was sending the hon. Member a copy of his reply. He could not promise at the present time to introduce legislation to amend the Act of 1894 in that particular.

The Thames Bridges.

Col. Ashley informed Mr. Day that, on May 24, the L.C.C. approved the arrangements for the expert engineering inquiry into the proposed double-deck bridge at Charing Cross and its estimated cost. The inquiry would commence at once. Pending the reception of the report of the engineers Waterloo Bridge would be maintained in its present position.

Housing Progress.

Sir K. Wood informed Sir J. Power that during the six months ended March 31, 1927, 111,066 houses were completed in England and Wales. The corresponding figures for the half years ended September 30 and March 31, 1926, were 106,563 and 91,021 respectively.

India House.

Mr. Stamford asked whether the architect selected to prepare final plans for the erection of a building in London to be known as India House was selected as a result of an open competition, or whether any preliminary plans or suggestions for the building, prepared by architects other than Sir Herbert Baker, were considered by the Government of India; and on whose authority the architect chosen was asked to prepare plans and who was responsible for the final selection.

Earl Winterton said that the answer to the first part of the question was in the negative. The architects was chosen by the High Commissioner for India, with the approval of the Government of India.

THE BUILDING TRADE

THE LAW OF FIXTURES.—VI.

By W. T. CRESWELL, Barrister-at-Law; L.R.I.B.A.; Associate (late Fellow) of the Surveyors' Institution; &c.

TRADE FIXTURES.

Relaxation of the Rule.

The rule that articles, when fixed, remain rt of the freehold, has been relaxed in pect to trade fixtures. All Case Law has ermined that any article which is fixed premises by a "tenant for years," for the poses of trade, may generally, as between dlord and tenant, be severed and removed him from the premises (see Poole's Case, 03; 1 Salk, 368). The relaxation in respect trade fixtures was made in order to en- rage industry (per Lord Holt, in Poole's e, *supra*). But it is required that it shall possible to make the severance without ious damage to the freehold; otherwise tenant has no right of removal of the tures. And as already stated, the removal the trade fixtures must be carried out ring the term of the lease; and should the nant attempt to enter in order to remove m after the term, he would be regarded as respasser.

Machinery, engines, plant, vats or utensils y be removed by a tenant as trade fixtures. In any case, trade fixtures, to be removable, st be either capable of being removed dily, or taken to pieces and put up again, as to be in form and use identically what ey were. The relaxation does not extend brick buildings let into the freehold, even these are an essential part of the movable ture.

Accessories or adjuncts to trade fixtures, d which serve no other purpose, may be moved with the fixtures, as, for instance, eds over same. Further, if the principal rt of a trade fixture is removable, its ac- ssories may now be removed, except when ch accessories are brick buildings, since ey are planted in the soil (see Whitehead *v.* ennett, 1858, L.J. Ch. 474; and Pole rew *v.* Western Counties, etc., Co., 1920, Ch. 97).

A nurseryman may remove trees planted r the purposes of his trade at the d of the term (see Lee *v.* Risdon, 1816, Taunt. 191).

Removal is not permissible if such removal ll cause "waste." In Oakley *v.* Monck 566) a person who held a nursery ground tenant, and had a right at the expiration his tenancy to remove fruit trees and rubs, planted by him, and which had taken ot, and also formed part of his stock-in- ade, was held not entitled to cut down or move plants which would only be destroyed such a process, and which would after- rds be of no use to him for the purpose his trade. Also, a market gardener has right to remove vines and fruit trees, art from the statutory right he has under e Agricultural Holdings Act, 1923, the re- ation in respect of trade fixtures not ex- nding to the domain of agriculture.

The rule of relaxation in favour of trade d not apply as between the heir and the ecutor where the chattels had been fixed the freeholder (see Dudley (Lord) *v* arde (Lord), 1751, Amb. 113; and Mather *v.* raser, 1856, 2 K. & J., 536).

Trade Fixtures where there is an Agreement.

But if there is any special agreement, it ay, unless carefully worded, operate to the ntrary, and to deprive the tenant of his gal rights to remove trade fixtures. Trade ixtures may cease to be chattels, and become rt of the freehold, after satisfactory evi- nce of the intention of the parties. How- er, the intention of the person fixing them is material only so far as it can be presumed from the degree and object of annexation (see Hobson *v.* Gorringe, 1897, 1 Ch. 182).

In re British Red Ash Collieries, Ltd. (1920), 1 Ch. 326 C.A., a mining lease had been granted to the Head Lessees, whereby they had covenanted that at the end, or sooner determination, of their term all erections, fences and fixed machinery in the demised seams or on the surface of the said premises should be left in good repair and condition by the lessees. Subsequently, certain debenture holders of the sub-lessees brought an article to enforce their security; and a receiver, who was appointed to go into the affairs of the sub-lessees, sold the machinery and plant upon the premises. It was held, on appeal, that the covenant in the Head lease operated to deprive the sub-lessees of their right to remove trade fixtures.

Test as to Removability.

The test as to the removability of trade fixtures, as given in "Amos and Ferard on the Law of Fixtures" after a consideration of the adjudged cases is as follows:—"Things which a tenant has fixed to the freehold, for the purposes of trade or manufactures, may be taken away by him, wherever the removal is not contrary to any prevailing practice; where the articles can be removed without causing material injury to the estate, and where, in themselves, they were of a perfect chattel nature before they were put up, or, at least, have in substance that character independently of their union with the soil; or, in other words, where they may be removed without being entirely demolished, or losing their essential character or value."

Buildings, Erections, Alterations and Improvements, Works.

Under a lease, the terms "buildings, erections, alterations and improvements, works," etc., may be used in enumerating the articles on the premises demised which are to be given up at the determination of the tenancy. In Naylor *v.* Collinge (1807), 1 Taunt 19, the term "buildings" was held to include trade buildings if such buildings were let into the soil, or otherwise fixed to the freehold, and if they were, then irremovable by the lessee.

In Peary's Administratrix *v* Brown (1818), 2 Stark 403 N.P., "erections, buildings and improvements" were held to include a verandah.

In Martyr *v.* Bradley (1832), 9 Bing 24, a covenant to leave a water-mill "with all fixtures, fastenings and improvements, fixed, fastened, or set up during the demise," was held to include a pair of new mill-stones set up by the lessee during the tenure, even though the custom of the country authorised him to remove them.

In Mansfield (Earl) *v.* Blackburne (1840), 6 Bing N.C. 426, "works" was held to include saltpans which had been set up by the lessee during the term, and were therefore irremovable, but in Beaufort (Duke) *v.* Bates (1862), 3 De G., F. & J. 381, "works" was held not to include tram-plates fixed to sleepers not affixed to the freehold, and which had become sunk in the soil by the pressure of wagons passing over them.

In West *v.* Blakeway (1841), 2 Man. & G. 729, the words "erection and improvements" were held to include a greenhouse which had been erected during the term of the lease, and was irremovable.

In Foley *v.* Addenbrooke (1844), 13 M. & W. 174, the words "erections, buildings, improvements and alterations" were held to include anything in the nature of a building, or support of a building, even though made of iron.

In Haslett *v.* Burt (1856), 18 C.B. 893, "improvements" were held to include a plate-glass front which had been put up during the term by the assignee of the lease, in lieu of an old one, and could not be removed.

But in Mears *v.* Callendar (1901), 2 Ch. 388, it was held that "improvements" did not include glasshouses put up by a market gardener with his landlord's knowledge.

In Bidder *v.* Trinidad Petroleum Co. (1868), 17 W.R. 153, it was held that "erections" was a wider term than buildings, and might include trade fixtures, which were consequently irremovable by the lessee who had covenanted to deliver up at the end of the term, "pumps, pipes, cisterns, and other things which then were, or at any time during the said term shall be, fixed or fastened to the freehold of the premises, or belong thereto."

Non-Removal at End of Lease.

A licence to construct and work a railway on the land of the licencor does not impose an implied obligation on the licensee to remove the structures at the termination of the licence. Nor can a landlord, in the absence of an agreement to the contrary, oblige a tenant at the end of his term to remove a building erected by the tenant during his term and which has become part of the land. (See Never-Stop Railway (Wembley), Ltd., *v.* British Empire Exhibition (1924) Incorporated, 1926, 95 L.J. Ch. 411.)

Compensation for Fixtures taken under Compulsory Powers.

Under the Lands Clauses Consolidation Act, 1845, and its amending Acts, compensation is payable for lands, etc., taken compulsorily. A landlord's fixtures would usually be taken over as potential parts of the land under such powers, but a tenant might remove tenant's fixtures, unless he elects to leave them; in which case the promoters must take them and pay the tenant compensation for them.

In Gibson *v* Hammersmith and City Ry. Co. (1865), 2 Drew & Son 603, the railway company gave notice to compulsorily take part of a manufactory; but, under the Act, was required by the owner to take the whole. A valuer, on behalf of the railway company, went to the manufactory, and, without entering it, valued it at a specified sum, and that amount was paid into Court. The company then proceeded to take possession, but the owner of the manufactory insisted that the valuation had not included certain fixtures upon the premises, such as a steam-engine, shaping and turning lathes, etc., and that the company was bound to take them for extra payment over the valuation. But the railway company contended that they were trade fixtures, removable by the owner, and that he could not compel the company to take them. It was held that although they were trade fixtures which might be removed, the railway company was bound to take them in the circumstances and on the evidence given.

As a further forecast of the course of law between landlord and tenant, in passing, reference may be made to a statement by the Home Secretary as to trade fixtures, at a recent sitting of the Standing Committee of the House of Commons appointed to consider the Landlord and Tenant (No. 2) Bill. He said that *ordinary* trade fixtures would not be taken over and compensation paid by the landlord therefore but that if lifts were put in, which were a distinct improvement and added to the value of the premises, at the end of tenancy the landlord should be required to take over and pay compensation therefor.

THE TRADE UNIONS AND TRADES DISPUTES BILL IN COMMITTEE

CLAUSE 3, sub-clause (1), of the Trade Unions and Trade Disputes Bill passed through Committee unamended but, as the Home Secretary explained, that clause is but declaratory of what the law is at the present moment, for the Government has considered it necessary to declare the law as it is, having regard to the large number of persons involved in the disputes of last year who asserted before the Courts that they were ignorant of the law and innocent of any intention to act illegally.

The sub-clause declares "that it is unlawful for one or more persons (whether acting on their own behalf or on behalf of a trade union or of an individual employer or firm, and notwithstanding that they may be acting in contemplation of furtherance of a trade dispute) to attend at or near a house or place where a person resides or works or happens to be, for the purpose of obtaining or communicating information or of persuading or inducing any person to work or to abstain from working, if they so attend in such numbers or otherwise in such manner as to be calculated to intimidate any person in that house or place, or to obstruct the approach thereto or egress therefrom or to lead to a breach of the peace; and attending at or near any house or place in such numbers or in such manner as is by this sub-section declared to be unlawful shall be deemed to be a watching or besetting of that house or place within the meaning of section 7 of the Conspiracy and Protection of Property Act, 1875."

In section 7 of the Conspiracy and Protection of Property Act, 1875, it was provided that attending near the house or place where a person resides or carries on business, etc., merely to obtain or communicate information, should not be deemed "a watching and besetting" within the meaning of that section, but this provision was repealed by section 2 of the Trade Disputes Act, 1906, which has the side-note "Peaceful Picketing" and which rendered it lawful "for one or more persons acting on their own behalf or on behalf of a trade union or of an individual employer or firm in contemplation or furtherance of a trade dispute" to attend "merely for the purpose of peacefully obtaining or communicating information or of peacefully persuading any person to work or to abstain from working."

Amongst the offences detailed in section 7 of the Conspiracy and Law of Property Act was "watching and besetting," and the present sub-section only declares that when the element of intimidation is introduced "peacefully persuading," etc., under Section 2 of the Trade Disputes Act is illegal, and attending near a house or place in such numbers or in such manner as is by this sub-section declared to be unlawful shall be deemed to be "watching and besetting."

There is no change in the law in this, and the law was so explained by the Home Secretary in the House of Commons on June 2, 1926, and in circulars to the police from time to time before that date (see *Builder*, July 2, 1926), but a change, "or explanation," of the law has been introduced in sub-clause (2) of the Bill, which defines what is "intimidation." This sub-clause provides: "In this section the expression to 'intimidate' means to cause in the mind of a person a reasonable apprehension of injury to him or to any member of his family or of violence or damage to any person or property," and the expression "injury" includes injury other than physical or material injury, and accordingly the expression "apprehension of injury" includes an "apprehension of boycott or loss of any kind." The sub-clause now stops there, the words "or of exposure to hatred, ridicule or contempt" having been expunged by the Government in Committee.

This definition is imported into the Conspiracy Act by sub-clause (3), and by sub-clause (4) it is declared that, notwithstanding anything in any Act, it is an offence for one or more persons, for the purpose of inducing any person to work or to abstain from working to "watch or beset." The outcry against this clause in the Bill has only served to show the latitude that has been imported hitherto during trade disputes into the procedure allowed under the Act of 1906 of "peacefully obtaining or communicating information or of peacefully persuading persons to work or not to work."

It is important, however, to observe that the Attorney-General, in the course of the proceedings in Committee, said that the clause did nothing to prevent an employer from preferring to deal with one trade union rather than another, nor from refusing to employ particular workmen, nor, on the other hand, did it prevent trade unionists from refusing to work for an employer so long as he employed non-unionists. The Home Secretary also said that the clause would not prevent an employer fixing a time-limit within which he would re-accept men out on strike, nor would it prevent the men from saying to the employer that unless their terms were accepted they would never work for him again.

Clause 4, sub-clause (1), which makes members of trade unions intimate their willingness to contribute to the political fund of the trade union, instead of, as at present being under obligation to contribute unless they express their objection to doing so, was passed with two minor amendments moved by Labour Members and accepted by the Government.

BOOK REVIEW

Marvels of Modern Mechanics: The Master Land, Sea, and Air. By HAROLD WILKINS. (London: T. Fisher Unwin Ltd.) 1926. 10s. 6d. nett.

The progress made in knowledge during the past 50 years, and its practical utilisation to comfort and needs of modern life is the theme this book. It is popularly—*i.e.*, simply written, and the ordinary reader will find little, if any, difficulty in understanding many marvels dealt with. Many years ago book entitled "The Infinitely Great and Infinitely Small" dealt with the same theme and here the "infinitely small" subjects microscopical, but the author of the book before us deals in the first chapter with the structure the atom. The atom, of course, is far beyond the reach of any microscope yet imagined, modern research and experimental skill have revealed its structure. Calculations of energy locked up in the atomic structure have been made, and speculations are frequently indulged in concerning the possible use "atomic fuel" in the future, when our stocks coal and oil has vanished.

The wonderful development of wireless graphy and then telephony is dealt with, reference is made to its use in navigation, a of advance hardly appreciated by the ordinary man in the street, who very seldom gives thought to its use outside "Broadcasting." Something is said about "radio-photo-phony" which will enable the reader to appreciate reproductions occasionally given by the Press. Charting seas, watching for icebergs, &c., dealt with, as well as the problems involved the laying cables and picking them up when defect develops, &c.,; scenic art of the modern theatre, and many other problems. We expect that this book will interest a very wide circle readers, as it is clearly written, well printed and illustrated.

TEMPORARY TIMBER CONSTRUCTION, INCLUDING SHORING—IV (Concluded.)

BY G. A. GARDNER. M.I.Struct.E., Assoct.I.E.E., etc.

e last article (Part III.) dealt with the itial matters to be considered in con-ion with beams and struts; and in porary timber structures the majority ie members, with the exception of brac- in simple tension, come under these categories. Members subjected to im- d transverse and endwise loading com- d, do not occur frequently, and since s on the treatment of such cases would be what outside the scope of these articles, matter will be summarily disposed of by tioning that if the extreme fibre stress to the transverse loading, plus the inten- of direct compression, is limited to the rable intensity of loading for the mem- as a strut, then, except in the case of ler members, a sufficient margin of safety obtain.

mentioned in a previous article, the s and connections in timber structures

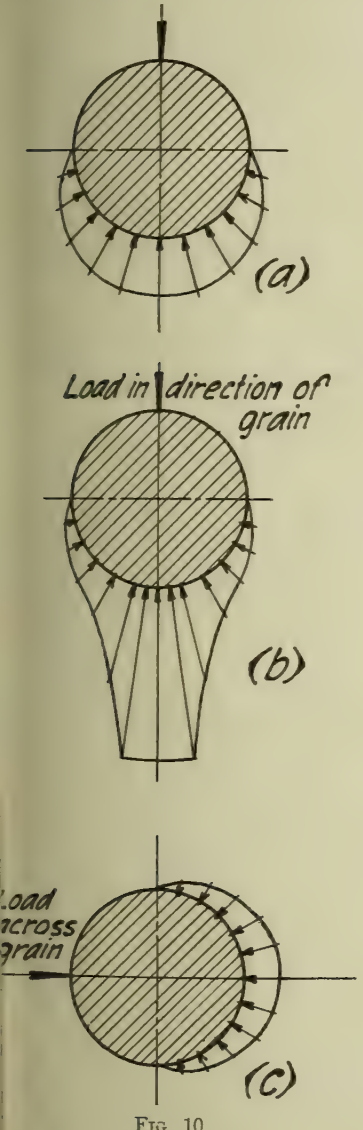

FIG. 10.

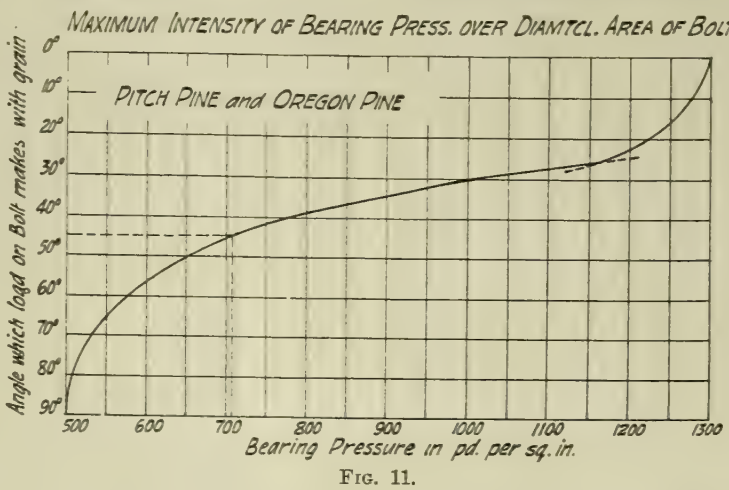
often badly proportioned; and the thesis of sound construction, namely, y members and weak connections, is iently met with. Where bracing mem- are provided merely to facilitate the al construction of the timber work, or are in to give general stiffness without being d upon to resist a definite and important e—as, for example, the force resulting from wind pressure on a tower structure, then the common practice of spiking or bolting the connections in accordance with the dictates of "experience" will usually just suffice on the one hand or give rise to considerably overdone provisions on the other. In more important cases, however, the connections should be designed to resist the known or assumed forces, within the safe working stresses for the timber and the bolts, as otherwise incipient failure may occur, giving rise to conditions which are dangerous, and necessitating some form of periodic maintenance.

The bearing pressure of the bolts (or spikes) against the fibres of the wood, and to a lesser extent the flexure of the bolts, are the two chief factors which govern the strength of connections; and in the lapped type of connection of a bracing to a post, for example, it is evident that these factors are, *inter alia*, dependent upon the thicknesses of the members connected and the angle of pull (or push) which the force on the brace, communicated by the bolts, makes with the direction of the fibres in the post. There is not sufficient experimental evidence available on which to base general rules for the proportioning of such connections; but in the writer's paper on "Some Aspects of Timber Construction" (loc. cit.), read before the Institution of Structural Engineers, the analysis suggested by Professor Jacoby is applied and extended, and values are tentatively laid down. Only the more general aspects of the matter can be touched upon here, and simplified rules given which will embody sufficient accuracy for practical use in dealing with temporary structures.

Owing to the marked decrease in the resistance of timber to bearing pressure across the grain as compared with its resistance to endwise bearing, the reactions of the wood elements (or "fibres") to pressure communicated by a bolt do not vary gradually from a maximum to zero, as is approximately the case where bolts bear in metal, as shown in Fig 10 (*a*), but there is a more or less sudden decrease in the resistance of the elements as soon as the radial pressure from the bolt becomes sufficiently inclined to depend on the lateral or crosswise strength of the wood. Fig. 10 (*b*) indicates the distribution of radial resistance suggested by mathematical analysis in the case where the load on the bolt is in the direction of the grain, and there is but little doubt that the actual distribution is of this order; while in the case where the pressure is perpendicular to the grain the distribution is likely to conform to that suggested in Fig. 10 (*c*).

Where the load on the bolt is inclined to the direction of the grain as in the case of a pull or thrust from a bracing member communicated to a main post, the distribution of resistance of the fibres will occur in some form intermediate between the two extremes already considered; and the value for the resistance at any angle, expressed in terms of a hypothetical uniform intensity of pressure



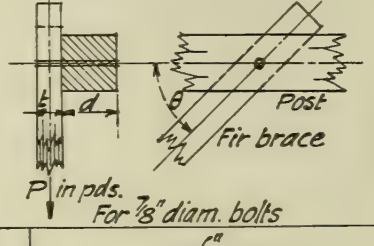


FIG. 11.

acting over the diametrical area of the bolt, is given by the graph in Fig. 11. The writer has used these values in practice and offers them tentatively pending the results of experimental evidence.

Besides the distribution of pressure across a bolt there is the longitudinal distribution dependent upon the thicknesses of the members passed through; the stiffness of the bolt to resist bending; and the drag on the bolt due to eccentricity of the applied load, as in the common instance of bracing attached to one side of a main member. These conditions give rise to complicated relationships which it is possible to deal with mathematically, but in respect of which there is very little experimental data; and therefore the following approximate and simplified method of investigation is offered as sufficiently accurate for temporary structures. Fig 13 shows what is considered to be the approximate

FIG. 12

form of the distribution of bearing resistance longitudinally in the several cases of the lapped type of connection which frequently occur in practice. In case (*a*), where the

thickness of the brace is small compared with the post, the eccentric pull of the brace is assumed to be resisted entirely by the jamming of the bolt within the post; but where the brace is comparatively thicker, as in case (*b*), jamming of the bolt tends to occur in both members. If it is sought to calculate the maximum resistance of a single bolted connection of this kind in any particular case, it is assumed that the maximum bearing pressures on the timber, conformable with the values given by the graph in Fig 11 for the particular angle which the direction of the load on the bolt makes with the grain of the wood, will be developed at the inner faces of the members, as shown in Fig. 13, and that the distribution along the bolt will then be such that the total load on the brace will just develop the bending resistance of the bolt at its maximum working stress. In the general run of cases occurring in temporary construction, the thickness of the brace will be small compared with the main member, and therefore the reverse bending of the bolt within the thickness of the brace (Fig. 13 (*b*)) has been neglected, for simplicity, in computing the table of bolt values (Fig. 12); and the resultant bearing pressure of the brace on the bolt has been assumed to act at $\frac{3}{8}t$ from the inner face of the brace, in all cases.

Many timber structures exist in which the flexural strength of the bolts, as limited by the values given in the table, is considerably exceeded; but it is to be noted that even if the bolts become actually set to a permanent bend due to the flexural stress passing the elastic limit, there is little likelihood of gross failure of the joint, provided the load is not variable, as the washers (which should always be large) will bear into the faces of the timber, and together with the jamming of the members, will help to preserve equilibrium. If, however, the load *is* variable in such a case, the joints will in time work loose, and the structure, if a tower, for example, will rock in the wind, with results which may prove disastrous.

Theoretical analysis of the lateral resistance of nailed joints is not practicable, but where in temporary work of sufficient magnitude, the economy of nailed as against bolted joints is a matter of some importance, actual tests may be carried out to ascertain the nail values. The longitudinal cross bracings in the Wembley switchback structure referred to in Part I. of these articles were nailed as the result of economic considerations.

A considerable number of laboratory tests on nailed joints have been carried out from time to time, especially in America, and empirical formulæ have been suggested; but these have to be used with caution, as there are so many factors, such as kind of wood; degree of seasoning; thickness of member connected, etc., affecting the values in any particular case.

Wire nails from 4 in. to 6 in. in length may be used for the attachment of bracings from $1\frac{1}{2}$ in. to about $2\frac{1}{4}$ in. in thickness; the penetration of the nail into the main member being never less than $\frac{5}{8}$ of the length of the nail. The safe working load per nail in any timber superior to spruce, Norway fir and white deal may be taken from the following table with sufficient accuracy for temporary structures.

ALLOWABLE LATERAL LOAD ON WIRE NAILS.
Penetration into Main Timber not less than 5/8 length.

Length of Nail	6 in.	5in.	4 in.
Diameter ...	0·218 in.	0·183 in.	0·156 in.
Load (in pds.)...	200	140	100

It is not possible in a short series of articles like this to give details of actual joints and connections for various sizes and arrangements of members, but as regards the grouping of bolts in a joint, care must be taken to see that the spacing is sufficiently wide to develop the safe shear resistance, etc., of the timber between the bolts, and that in the case of a bracing member, for instance, the timber continues a sufficient distance past the end of the bolt. It will be appreciated from Fig. 10 (*b*) that the radial pressure between the bolt and the wood gives rise to a crosswise splitting action in the end of the brace; and since the resistance to tension across the grain is small the longitudinal area down the centre of the brace past the centre of the bolt must be sufficient to keep this splitting stress within safe limits. This condition is aggravated by the tendency of the timber to check and split at the ends as a result of seasoning. The writer heard of a case in which, after care had been taken to leave an adequate length of timber beyond the bolts, a fresh carpenter came on to the work, and thinking the appearance of the protruding ends unsightly, elected to saw them off flush with the main timbers!

As a general guide, the minimum projection past the centre of the bolt for members in tension should be 9d (where d is the diameter of the bolt), and the longitudinal spacing of

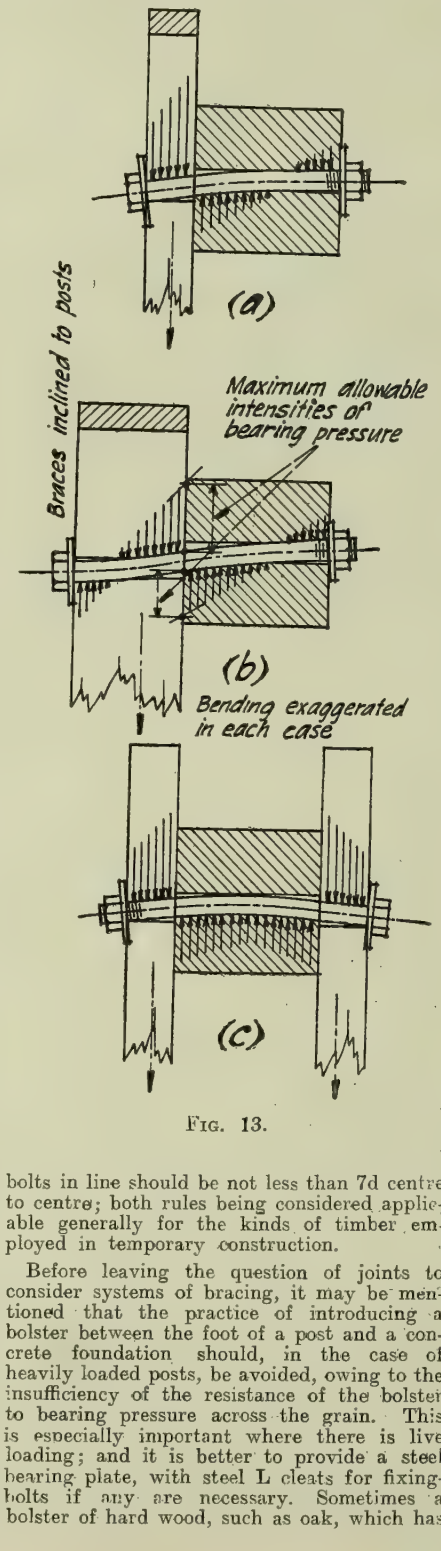

FIG. 13.

bolts in line should be not less than 7d centre to centre; both rules being considered applicable generally for the kinds of timber employed in temporary construction.

Before leaving the question of joints to consider systems of bracing, it may be mentioned that the practice of introducing a bolster between the foot of a post and a concrete foundation should, in the case of heavily loaded posts, be avoided, owing to the insufficiency of the resistance of the bolster to bearing pressure across the grain. This is especially important where there is live loading; and it is better to provide a steel bearing plate, with steel L cleats for fixing-bolts if any are necessary. Sometimes a bolster of hard wood, such as oak, which has a considerably greater resistance than conifers to crosswise compression, may s

The system of bracing most comm temporary timber construction is th which the diagonals are crossed in each between horizontal rails; the crossed me in the case of a tower, for instance, being considered in each panel as indepe tension braces not acting in concert, alternately, according to the direction o wind. In the case of tall structures, the force on the braces is considerable, arrangement should be avoided on accou the difficulty in providing adequate str at the end connections; and both diagon each panel should be designed to take share of the load. If each diagonal sumed to take equal proportions of the (which is approximately true) then the stresses will be halved, but both me must be made stout enough to act as st and if they are suitably connected where cross, the staying effect will allow the tional dimensions of the struts to be re to a minimum.

A K formation of bracing, thus:— may be shown to offer advantages in some cases over the more usual X or N types, especially in structures of considerable magnitude, where it is important to provide against secondary stresses resulting from the deformation of the structure under load.

High stresses due to secondary bending occur in the main members by reason of ing connections not meeting at a point; in special cases a calculation is necessa see that these stresses are not allowed t come excessive.

It sometimes arises in temporary work the joint sufficiency of bracings, wheth towers or trusses, cannot be provide the elementary lapped type of connection that recourse must be had to the use of tie-rods for the tension members, with bracing struts properly framed against main members; and in these cases it is bearing pressure across the grain of the timbers which must be considered Part I. of these articles).

In dead-shoring schemes, where the we to be supported are considerable (in cases, for instance, amounting to hundre tons), wedges must be introduced at a priate places to counteract the shrinkage compressional deformation of the timbers the bearing resistance of hardwood we may be quite inadequate, necessitating use of steel folding-wedges and skid plate

The treatment in these articles has necessity, been incomplete, but the sub matter must now be concluded, with a minder that the dictates of economy sh never excuse the omission of fire extinguis lest the most carefully thought-out temp structure be reduced to a heap, and wit perhaps, a whole building!

New Ecclesiastical Buildings: Swanse

The Commission of Inquiry in the A deaconry of Gower, which has sat since end of November, 1923, until March of year, has now issued its findings, cont in three interim reports and one final re If all its recommendations in the final r of the Commission of Inquiry in the A deaconry of Gower are given effect, five parishes will be required, ten parishes require to be united, ten parishes will re alteration of existing boundaries, and the additional accommodation will be ten chu and six mission rooms: and the total tional pastoral supervision will be thre cumbents, fourteen curates, and four lic lay readers. The estimated capital cos new buildings will be £150,000, and the mated annual cost for additional staff w £4,000. The parishes said to be most urg in need of attention are St. Mary (Swa Sketty, Oystermouth, All Saints, K Llansamlet, Llangyfelach, Clydach, St. P Landore, St. Peter's, Cockett, Llandilo bont, and Ystradgynlais.

HE LANDLORD AND TENANT (No. 2) BILL, PART I. *(continued.)*

Compensation for Goodwill.

use 4 deals with compensation for vill In this case a tenant of a holding hich this part of the Bill applies may a claim in the prescribed manner not than 18 months nor less than six hs before the termination of the cy (in the case of improvements the were not more than six months nor than three months), for compensation goodwill at the termination of the cy, if he proves to the satisfaction of ribunal that by reason of the carrying y him or his predecessors in title at remises of a trade or business goodwill become attached to the premises, the it of which will in the absence of gements to the contrary enure to the ord.

proviso (a) the sum awarded as com- tion shall not exceed the capitalised of such addition to the letting value he holding at the termination of the cy as may be determined to be the t result of the carrying on of the trade siness by the tenant, and in determin- uch capitalised value the tribunal shall, is proved that the premises will be lished, have regard to the effect of demolition on the value of the will.

e words in "the absence of arrange- s to the contrary," at the end of the e clause, appear to refer to proviso which we now give in full, as it ars rather obscurely drawn:—"The t shall not be entitled to compensation spect of such goodwill if within one h after the making of the claim the ord serves on the tenant notice that he lling to grant to the tenant a renewal e tenancy at such rent and for such as the tribunal may consider nable; and if the tenant does not within month from the service of the notice to the landlord an acceptance in ng of the offer the tenant shall be ed to have declined the offer."

is clause appears to us obscure because opening words are "the tenant shall be entitled to compensation" unless the ord makes the offer, and it is not what effect those words have upon the r part of the clause, "and if the tenant not within one month from the service he notice send to the landlord an otance in writing of the offer the tenant be deemed to have declined the offer." he tenant declines, does the matter in open to compensation, or is it at nd? The natural reading of the word d" makes the latter portion subject to opening words that the tenant shall not entitled to compensation, and that ars to be the intention. By sub-clause where the offer of renewal is accepted, rent fixed by the tribunal shall be the at which in the opinion of the tribunal lling lessor would let the premises to a ng lessee having regard to the terms he lease, but irrespective of any good- which may have become attached to premises by reason of the tenant or predecessors in title having carried on at a particular trade or business.

the Bill left the matter there, there t be little to be said against it, but following clause (5) carries the matter ter, and this appears one of the clauses he Bill most likely to prove highly ntious. Clause 5, sub-clause (1) is here the tenant alleges that such com- ation as is provided in the last foregoing on will not compensate him for the loss will suffer if he removes to and carries his trade or business in other premises may at any time, not more than 18 ths nor less than six months before the ration of the tenancy, serve on the lord notice requiring a new lease to be ted to him."

Sub-clause (2) provides where such notice is served, the tribunal on the application of either the landlord or the tenant made not less than three months before the termination of the tenancy, may, if it considers that the grant of a new tenancy is in all the circumstances reasonable, order the grant of a new tenancy for such period (being a term of years absolute), and on such terms as the tribunal may determine to be proper. The provision as to how the rent is to be fixed is very similar to that in the preceding clause, and we need not set it out again.

Sub-section (3) provides that the grant of a new lease shall not be deemed to be reasonable (a) where the tenant is the applicant unless he proves that he is a suitable tenant and that the compensation he is entitled to under clause 4 would not compensate him for the loss he would suffer if he removed to and carried on his trade or business in other premises. In this clause the expression "the loss he would suffer" appears to us too wide, as it might cover the costs of removal and other charges the intention must surely be a loss wholly connected with the goodwill.

The sub-section then prescribes that a grant of a new lease shall not be deemed reasonable if the landlord proves:—

(i) That the premises are required for occupation by himself or by a son or daughter of his over 18 years of age, or by some person bona fide residing with him; or

(ii) That he intends to pull down or remodel the premises; or

(iii) That vacant possession is required to carry out a scheme of redevelopment;

(iv) Where the landlord is a Government Department or a local or public authority or a statutory or public utility company that the premises are required for the purposes of the department or of the undertaking or company;

(v) That for any other reason the grant of such a lease of the premises would not be consistent with good estate management, and for this purpose regard shall be had to the development of other property of the same landlord.

But there is a proviso that if a grant of a new lease is refused by the tribunal on any of the above grounds (other than the unsuitability of the tenant) the tribunal may make it a condition of refusal that if the landlord fails to carry out his intention within such period as may be allowed by the tribunal the landlord shall pay to the tenant such compensation as the tribunal may fix.

By sub-clause (4) provision is made for a case where the landlord does not immediately require the premises for any of the above purposes, but will do so after a lapse of time.

Sub-clause (5) provides that an order for a new lease shall not be made if the landlord offers as an alternative to sell to the tenant the landlord's interest in the premises at such price as the tribunal may determine, and the duration of the landlord's interest is in the opinion of the tribunal adequate.

By sub-clause (6) where the immediate landlord is a mesne landlord, the expression "landlord" in this clause shall include any superior landlord who may be affected by the order of the tribunal. The tenant shall not be under any obligation to send a notice under this clause to any landlord except his immediate landlord, but the immediate landlord if a mesne landlord shall send a copy of the notice to his immediate landlord, and this procedure is to continue to any other landlords affected by the provisions of this clause, and if any landlord fails so to send copies of the notice to his immediate landlord he becomes liable to pay the tenant for any loss the tenant may suffer in consequence of such failure, the amount of such compensation to be determined by the tribunal.

We have already referred to clause 6, which apart from the special provisions contained in clause 5, deals with the rights of mesne landlords.

Now we have set out the terms of clause 5, we think it will be agreed it is one of the most contentious clauses the Bill contains—the granting of what may be termed compulsory leases on the ground that the compensation to be awarded for goodwill under the previous clause will not compensate the tenant for the loss he will suffer if he removes at the end of his lease involves apparently a double inquiry, and coupled with the inclusion in the expression "landlord" of all superior landlords, and the reasons these landlords must prove to retain control over their own property and the constant interference by the tribunal, recall the worst features of Rent Control and must seriously handicap both the erection and ownership of business premises, and we shall hope to see this clause very considerably modified, if not expunged in the passage of the Bill through Parliament.

We can touch upon the remaining clauses in this part of the Bill very briefly. By clause 7 contracting out is prohibited; by clause 8 a right of entry is given to a landlord of any holding to which this part of the Act applies for the purposes of this part of the Act, presumably for the purposes of inspection.

Clause 9 allows either a landlord or a tenant to deduct any sums due from one another; clauses 10 and 11 relate to charges in respect of money paid as compensation and the powers to apply and raise capital; and clause 12, which defines the holdings to which this Part of the Bill applies, we have already noted. This concludes Part I.

We have received from the Leasehold Reform Association a letter with regard to the Government's Landlord and Tenant Bill, in which it is stated that "the principal reforms which leaseholders demand may be summarised as follows:—

"First, a right to renewal of tenancy on fair terms. If this were given subject to reasonable safeguards, the vexed question of compensation would arise much less frequently.

"Second, compensation for uncovenanted improvements in respect to all types of property—houses as well as shops.

"Third, compensation for valuable goodwill wherever it exists, including the goodwill of professional men, doctors, etc., as well as of traders.

"And last, but by no means least, some means of obtaining the right in special circumstances to acquire their freeholds compulsorily. Leasehold enfranchisement is not the most satisfactory remedy for all forms of grievance, but there are unquestionably circumstances where it ought to be available. It is intolerable that in towns where all the land is monopolised by one or two great landlords they should be able, by refusing to sell freeholds, to hold the whole community perpetually at their mercy."

"Not one of the reforms outlined above" (concludes the letter) "is at present contained in the Government Bill. Unless they can be included in the course of the Committee stage, the final measure will be lamentably inadequate, however excellent its intentions, and may, in fact, only serve to delay a proper treatment of the leasehold problem."

April Building Plans Approved.

Returns from local authorities in 140 of the principal urban areas in Great Britain (except the London County Council area), with a total population of 15,986,000, show that in April, 1927, plans were passed for buildings of an estimated cost of £5,395,300, as compared with £5,358,800 in March, 1927, and £5,702,600 in April, 1926. Of the total for April, 1927, dwelling-houses accounted for £3,692,600; factories and workshops for £320,900; shops, offices, warehouses and other business premises for £284,600; and other buildings, and additions and alterations to existing buildings, for £1,097,200.

NEW BUILDINGS IN LONDON

Barking.—HOUSING SCHEME.—The Town Council has approved a scheme for the erection of 372 houses on the Upney Estate, on which sites have also been reserved for an elementary provided school, and elementary non-provided school and a church. Plans have been prepared by the Council's Architect, Mr. J. Dawson, Clockhouse Chambers, East-street, Barking.

Brompton Road.—PREMISES.—Messrs. A. Leveridge and Son are altering and enlarging premises in Cheval-place, Brompton-road, S.W., for the United Dairies, Ltd. Messrs. Young and Co., 6, Queen Anne's Gate, Westminster, are supplying the structural steelwork.

Commercial-road East.—REBUILDING.—The premises of 196-200, Commercial-road East, belonging to Messrs. Percy Young are to be rebuilt to the plans of Mr. A. T. G. Harbour, of 200, Cable-street, E.1. The demolition is not yet commenced, and no building contract has been let.

Eltham.—HOUSING SCHEME.—The Woolwich Council have received the sanction of the Ministry of Health to the erection of a further 54 houses on Section "C" of the Council's Housing Estate at Eltham. It is proposed to erect these by direct labour. Plans have been prepared by Mr. J. Sutcliffe, the Borough Engineer.

Eltham.—Two SCHOOLS.—The London County Council propose to erect two elementary schools on the Woolwich Borough Council's housing estate at Eltham. One is to be north of the Shooter's-hill proposed by-pass road, and for 800 places—capable of extension by a further 400, and the second south of the proposed road—740 places, capable of extension by a further 256 places. Plans are being prepared by the Architect's Department at the County Hall, Westminster.

Guildhall.—REBUILDING.—At a recent meeting of the Corporation, the City Lands Committee submitted a scheme for rebuilding the Public Health Department Committee's Room and the offices of the City Engineer at the Guildhall, Gresham-street. The cost is estimated at £50,000. It is understood that Mr. Sydney Perks, F.S.I., F.R.I.B.A., is to prepare the plans.

Harrow-on-the Hill.—HOUSING SCHEME.—The U.D.C. have sought the sanction of the Ministry of Health to a housing scheme—estimated to cost £88,150—for which sketch plans have been prepared by Mr. J. P. Bennetts, the Council's Surveyor.

Hendon.—HOUSING SCHEME.—The U.D.C. propose to erect a minimum of 156 houses on a site at Clutterhouse-lane, Cricklewood. The lay-out—which is capable of extension—and plans will be prepared by the Council Surveyor's Department.

Ilford.—SCHOOL BUILDINGS.—The Borough Council are proposing to erect open-air School Buildings in Benton-road, Ilford, to the plans of Mr. H. Shaw, M.Inst.C.E., Architect to the Education Committee, Town Hall. Tenders are now being invited.

Islington.—TOWN HALL EXTENSION.—Mr. E. C. P. Monson, F.R.I.B.A., Finsbury Pavement House, E.C.2, has prepared plans for further extensions to the Town Hall at Tyndale-place, Upper-street, Islington.

Marshall-street.—BATHS REBUILDING.—Regarding the rebuilding of these baths in Marshall-street and Dufour's-place—announced in the last issue of *The Builder*—Mr. A. W. S. Cross, F.R.I.B.A., 46, New Bond-street, W.1, has been unanimously recommended for selection as architect.

Romford.—TELEPHONE EXCHANGE.—H.M. Office of Works are proposing to erect a new telephone exchange at Hornchurch, Romford. Tenders are now being invited.

Poplar.—LIBRARY.—A scheme is on foot for the extension of the Bow Library at an estimated cost of £4,500. Plans are to be prepared by the Borough Engineer, Mr. Harley Heckford, M.Inst.C.E.

Ruislip.—PREMISES.—Messrs. E. A. Prowting and Co. are the local contractors erecting new premises at Ruislip to the designs of Mr. E. W. Mountford, A.R.I.B.A., Bedford-row, W.C. Messrs. Young and Co., 6, Queen Anne's-gate, Westminster, S.W.1, are supplying the steelwork.

Stamford-hill.—PRESBYTERY.—The erection of new presbytery at St. Ignatius College, Stamford-hill, N., is in progress under the supervision of Messrs. Benedict Williamson and J. H. Beart Foss, architects. This work is being carried out by Messrs. Hall, Beddall and Co., Ltd., Pitfield Wharf, Waterloo Bridge, S.E.1.

Stratford.—TELEPHONE EXCHANGE EXTENSION.—H.M.O.W. propose to carry out extensions at the Maryland Telephone Exchange, E.

Tottenham.—SCHOOLS EXTENSION.—The Tottenham Education Committee propose to make extensions to their school at Devonshire Hill, White Hart-lane. Mr. C. E. Blackbourne, F.R.I.B.A., 34, Finsbury-square, is the architect, and tenders are now being invited.

Twickenham.—SCHOOL.—Mr. T. H. Smith, of Messrs. Brewer, Smith and Brewer, 11, The Green, Richmond, has prepared plans for an extension to the Convent High School at Pope's Villa, Twickenham. Messrs. Soole and Son, Dunstable Works, Sheen-road, Richmond, are the builders.

Wandsworth.—FLATS.—The Wandsworth B.C. are to erect 14 flats at Blackshaw-road. Mr. F. L. Poole, 24, New Bridge-street, S.W.1, is the architect, while quantities have been prepared by Mr. W. Thompson.

SOUTHERN COUNTIES FEDERATION OF BUILDERS.

THE half-yearly meeting of this Federation was held at the Grand Hotel, Bournemouth, recently, under the presidency of Mr. R. F. Seward, F.I.O.B. (of Messrs. Jones & Seward, Ltd., of Bournemouth). The delegates, of whom there were about 55, were welcomed by the Mayor of Bournemouth (Ald. H. J. Thwaites), who remarked that the town had building regulations which, he hoped, were not too stringent. Sometimes their building friends were not exactly happy or good-tempered over some of them, but they were trying their best to see that the town progressed on right lines.

Mr. C. P. Lovell, immediate past president, thanked the Mayor for his attendance, and referred to the amenities of Bournemouth.

The Mayor, in responding, reminded delegates that their president was actively connected with one of the greatest ventures the town had ever embarked upon—the new pavilion. By the way it was shaping they were going to have a magnificent structure worthy of the town and of their president.

The general meeting occupied the remainder of the morning, and was held in private. A report was to be received from the administrative committee in connection with the proposed amendments to the constitution and rules of the National Federation, and in this connection the president and director of the National Federation, Mr. F. W. King, F.I.O.B., and Sir J. Walker, Smith, as well as Mr. A. H. Adamson, F.I.O.B., president of the London Master Builders' Association, had been invited to attend and express the views of their respective organisations.

Mr. W. G. Spickernell, president of the Bournemouth Building Trades' Employers' Association, presided at a lunch which followed, those present including the Mayor and Mayoress, Mr. E. W. King, Mr. R. F. Seward, Councillor F. B. Bending, J.P., F.I.O.B. (senior vice-president), Mr. A. Cannon (secretary of the Federation), and Messrs. A. J. Playdon and M. S. Plomer (president and secretary of the Bournemouth Chamber of Trade).

Mr. R. F. Seward, responding to the toast of "The Federation," commented on Trades Union Bill, and said that those spent so much time in consultation labour felt that it had come as one of best things of their time. It would men's minds and enable them to devote t selves to their industry without draggin those things that had no place withi Nothing but good, in his opinion, w come out of it, for it would give every freedom to work out his own salvation. products of the building industry in southern counties, he concluded, comp very favourably with those in other par the country.

Replying to the toast of "The Bournem Building Trades Employers' Associati Mr. W. G. Spickernell said labour tro had been practically nil in Bournem during the past fifteen months, and they gone through the general strike without real trouble.

In the afternoon the delegates visited new Bournemouth pavilion works, where Seward acted as guide. Interest princi centred on the concert hall, which is well on towards completion. Many ques were asked about the balconies which, it explained, would be constructed on the c lever principle. The platform, when pleted, will be capable of being raise lowered by means of hydraulic pres When in the lowered position, a sliding will completely obscure it from view.

The evening was occupied with a rece given by the president at the Prince's Grand Hotel, about 200 guests being pre In the course of the evening the present of a silver salver was made to Mr. C Lovell, and in making it Mr. Seward s in appreciative terms of the hard work Mr. Lovell had put in on behalf of Federation during the post-war years. had taken a prominent part in the str to bring the industry back to the da sound common sense which they knew come if it was to prosper. Since the had worthily filled the office of preside

The Building Trade.

We take the following from the "B of Trade Journal":—

"Employment continued to imp during April, especially in the painting decorating section; it was generally goo most centres, with skilled operatives moderate with unskilled workers. Em ment showed a decline, on the whol compared with April, 1926, but there some improvement in the London area in Scotland and Northern Ireland.

"As regards individual occupat employment continued to improve bricklayers, and was very good at m centres; it remained generally good plasterers; a shortage of these classe operatives, especially of bricklayers, wa ported from a number of districts. Em ment showed a further improvement carpenters and joiners and with masons was good in most districts with the for and fairly good, on the whole, with latter; it remained fairly good with sl and moderate with plumbers; it show further seasonal improvement with pain and was good generally. Employment tinued moderate, on the whole, with buil labourers."

County Library Conference.

We have received a copy of the r of the proceedings of the County Li Conference, held in London last Nover The subjects dealt with are as follow "Experiments in Co-operation"; "T port Problems"; "The Problem of Populous Area"; "The Educational I tion of the County Library"; "The Ce Library for Students"; "The County A rity and the Library Service: Finance Administration." Copies of the report be obtained, post free, on application t Secretary, East Port, Dunfermline.

(For rates of wages in the Building Trade in Scotland, see page 913.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

TRADE NEWS

"Bull-Dog" Floor Clips.

The illustration given herewith is of a new clip, "The Bull-Dog," designed for laying wood finish floors over concrete construction. The method of using this little device—which has become very popular in America—is very simple. When wood floors are to be anchored in reinforced concrete buildings, the concrete floor slabs are poured in the usual manner, with screeds placed every 8 or 10 feet, so that as the concrete is poured, it can be levelled off with the straightedge. There are six simple steps. The first is the placing of the clips. Within about 30 minutes after the concrete floor slab has been poured and levelled, the double or a single guide board is placed on the slab, and while the concrete is still in a plastic condition, the clips are pushed into place at the guide marks so they embed with their flat tops flush with the concrete, accurately spaced and in alignment. The second step is the raising of the tabs. When the job is ready for the wood floors to be laid, a workman inserts a chisel or the claw of a hammer under the top tabs of the floor clips and with a flip of his hand raises them perpendicularly, ready to receive the nailing strips. Next comes the placing

of the strips. Nailing strips or sleepers measuring 1 $\frac{13}{16}$ in. by 1$\frac{5}{8}$ in., the standard dressing or regular 2 in. by 2 in. strips, with the same allowance for 3 in. and 4 in. strips, are then placed along each row of floor clips, where they are held snugly between the raised tabs. The fourth step is the levelling up. The level slab obtained by placing screeds before pouring, and the embedding of clips so their tops are flush with the slab surface assure an almost faultless base. The fifth step is the slushing in; while lastly comes the laying of the wood floor. After the nailing strips have been securely fastened and solidly bedded as just described, the finished wood floor—or diagonal rough flooring when specified—is laid in the usual manner, and firmly nailed to the sleepers. The dead air space assists in sound-deadening, and prevents deterioration by dry rot. The "Bull-Dog" clip is the product of Bull-Dog Floor Clip Co., 108, N. First Avenue, Winterset, Iowa, U.S.A., and is being handled in this country by the Adamite Co., Ltd., Regent House, W.1. Among other contracts now in hand, the clip is being used at the Carreras factory in Mornington-crescent, the new Corner House at New Oxford-street for Messrs. J. Lyons and Co., the Civil Service Supply building in the Strand, and the Gramophone Company factory at Hayes.

The Adamite Company will be pleased to supply full information and answer any questions upon application.

Mantelpieces in Wood.

Architects, contractors, and others who had the opportunity of seeing the Bath Artcrafts, Ltd., display of craftsmanship at the recent British Industries Fair, Birmingham, will be glad to know that the firm have issued an attractive catalogue of their wood mantelpieces. The designs are of a distinctive character, into which are introduced woods foreign to the usual mantelpiece trade.

Novocrete Products.

In connection with the new stands at Epsom racecourse, which we illustrated last week, attention is drawn to the Novocrete flooring tiles, which have been provided by the Novocrete Cement Products Co., Ltd. Novocrete is concrete made by special process with a patent mineralised wood aggregate in place of the usual sand, ballast, etc. It is claimed the material has many valuable properties, and among the claims made are the following:—May be sawn like hardwood; will readily take nails and screws in the same way; is approximately from a half to a third the weight of ordinary concrete; is tough and hard wearing; is warm, silent and resilient to the tread; is a soundproof and non-conducting material; has proved fire-resisting qualities of a high order; improves with age, like concrete, and can be made in any colour and polished. The tiles are obtainable in a variety of attractive and soft tones and colours, with which antique or modern designs may be formed. They are supplied in three different finishes, which are available in any of the colours mentioned, viz.:—(1) Natural state, non-slip surface, suitable for courtyards, kitchens, pantries, passage-ways, hall-ways, etc.; (2) natural state but with edges trued up square, so that the tiles may be laid with fine hair joint, for halls, loggias, country houses, etc.; (3) as above, but with surface scoured down smooth to show aggregate and wax polished. Such a flooring, whilst of attractive marble-like appearance, retains warmth and resilience. The address of the company is Argyll House, Regent-street, W.1.

New China Works at Erith.

On a site of about 25 acres on the south side of the Thames Estuary, at Erith, Kent, a new factory is approaching completion, to which will be transferred, in the near future, a branch industry—the manufacture of stoneware pipes for drainage—which has occupied one of the Lambeth factories of Messrs. Doulton and Co., Ltd., for the past eighty years. Established in 1846, in the days when the importance of sanitation was being urged by a small band of enthusiasts, Doulton's Lambeth Pipe Works were the first in the world to be equipped for the manufacture of pipes for drainage and sewerage, followed soon afterwards by their works in Staffordshire and Lancashire. Since then, their London pipes have been made from stoneware clays from their clayfields situated on Poole Harbour. The Erith factory, with its modern equipment, should maintain the high reputation which the Doulton product has enjoyed during the past eighty years.

A Scottish Representative.

Messrs. Marshall, Sons and Co., Ltd., engineers, Britannia Ironworks, Gainsborough, Lincs, inform us that they have just appointed Mr. Geo. E. McCaw, M.I.A.E., 112, Bath Street, Glasgow, to represent them in Scotland. Mr. McCaw succeeds the late Mr. J. S. Richardson, who for many years represented Messrs. Marshall, Sons and Co., Ltd.

Valves and Jointings.

Messrs. Jenkins Bros., Ltd., of 6, Great Queen-street, W.C. 2, and Montreal, Canada, have issued a comprehensive catalogue of valves, jointings, and mechanical rubber goods. This contains a great deal of valuable data for buyers of valves, and is sent free to all interested, upon application.

School Treatment Centre, Poplar.

The Hon. Lady Lawrence, J.P., opened the extensions at 69, East India Dock Road, for the Poplar School Treatment Centre. Closely allied to the London Hospital, the Centre has been open for 15 years, and the extensions are significant of the good work which has been done. The building work was carried out by Messrs. Perry and Co. (Bow), Ltd.

RENT DECONTROL

A CASE is reported in the *Times*, May 13, kley v. Wilson, which raises a point of portance under Section 2, Subsection (1) of Rent Act of 1923. The defendant was tenant of a cottage which she held on a rterly tenancy, paying £2 12s. a quarter l the rates and taxes, and she had been enant for some 18 years, but she had sub- it to other persons from time to time. the end of 1925, one Riordan was in occu- ion as her sub-tenant, but he died on cember 4 of that year, and the defendant k possession and had the cottage cleaned . and after an interval of some ten days let the whole cottage to the plaintiff in s action at a weekly rent of 2s. 6d. In gust, 1926, differences arose between the endant and the plaintiff, and the defen- it gave the plaintiff notice to quit. She imed that the cottage had become decon- led under the above section. On this notice ceedings were taken under the recovery of all Tenements Act, 1833, but those pro- dings failed owing to some defect in the ice. In October, 1926, fresh proceedings re taken, and the justices made an order possession. The plaintiff then brought an ion for trespass against the defendant in County Court, alleging that she had no al right to possession, apparently on the und that she being herself a tenant of cottage was not a "landlord" within tion 2, Subsection (1) of the Rent Act, 3. The County Court Judge gave judg- nt for the defendant, but the plaintiff ealed.

The Divisional Court affirmed this judg- nt on the ground that the defendant was "landlord" within the meaning of Sec- n 2, Subsection (1). The case is to be ther reported and leave to appeal was nted on terms. This case, where the whole tage was let, came under the first part the subsection which gives de control a landlord who comes into possession, it is only under the proviso to that tion which deals with cases where parts premises are sub-let that in the decided es a distinction has had to be drawn be- een a head landlord, a mesne tenant, and sub-tenant.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Culter.—HOUSES.—Tenders are being invited for various works in connection with the Culter housing scheme for the District Committee of the Aberdeen C.C. Messrs. Walker and Duncan, C.E. and architects, 3, Golden-square, Aberdeen.

East Lothian.—MINERS' HOUSES.—Mr. Mowat, general manager to the Summerlee Iron Company, is to submit to his directors a proposal to improve 128 two-roomed houses in Summerlee-street, and 44 houses at Morrisons-haven, by providing each with a scullery, bath, and w.c., the improvements to be carried out by instalments over a period of five years. Provided his directors agreed to carry out this proposal, it was stipulated that the Western District Committee at Haddington would, in the event of their proceeding with a further housing scheme, favourably consider the erection of a share of the houses in the vicinity of Cuthill, if suitable ground could be acquired.

Pentland Hills.—RESERVOIR.—It is proposed to construct a great new reservoir at Baddinsgill, in the Pentland Hills. The cost is estimated at £350,000.

Stirling.—PICTURE HOUSE.—The plans submitted to the Works Committee of the T.C. included a set by Messrs. Menzies Bros., 15, Orchard-place, Stirling, for the erection of a picture house at 48, Queen-street.

Plans for Edinburgh Cenotaph.

A plan for Edinburgh's Cenotaph, prepared by the City Architect, has been approved by the Lord Provost's Committee of Edinburgh Town Council. According to the plan, the Cenotaph will take the form of a stone of remembrance similar to that used in various war cemeteries. The proposed stone will be 9 ft. long, and it is suggested that it should be placed with its frontage on High-street in order that the lettering may be seen to advantage. The City Architect also suggested that sockets should be made in the four piers round the stone, so that flags could be placed in position on special occasions, and that the three arches should be enclosed by a low fence, consisting of uprights and chains. With regard to the Wallace and Bruce memorial, it was recommended by the committee that statues of Wallace and Bruce should be placed in the niches at the entrance to Edinburgh Castle, and that Scottish sculptors should be invited to submit designs.

Housing Progress in Scotland.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to April 30, 1927:—

	Completed	Under construction.
1919 Act...	25,542	8
Private subsidy schemes (1919 Additional Powers Act) ...	2,324	—
Slum clearance schemes	5,272	1,951
1923 Act—		
By local authorities	3,216	717
By private enterprise	9,431	3,008
1924 Act—		
By local authorities	7,603	13,887
By private enterprise	257	215
Demonstration houses	17	—
	53,664	19,786

Clyde Town-Planning.

Major Walter Elliot, Under-Secretary for Scotland, presided over a town-planning conference in the City Chambers, Glasgow. According to statutory enactment, burghs of over 20,000 inhabitants must submit a scheme of town-planning before January 1, 1929. There are 22 such burghs in Scotland, 11 of them being in the Clyde Valley area. The object of the conference was to link up the schemes in the area, and to set up a Regional Advisory Committee to deal with the preparation of a scheme of regional town-planning for the Clyde Valley.

BUILDING TRADE WAGES IN SCOTLAND.*

Bridge & Co., Brixton	9,965
C. H. Gibson, Ltd., Croydon	9,693

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A COPY WILL BE SENT BY RETURN, AND YOUR REMITTANCE REFUNDED IF THE BOOK DOES NOT SATISFY YOUR REQUIREMENTS.

B. T. BATSFORD, LTD.
Publishers, 94, High Holborn, London, W.C

*The James Dredging, Towage and Transport Co., Ltd., Southampton £34,188

SWAVESEY.—10 houses for U.D.C. Mr. W. A. Lea, architect, 4, Market-hill, Huntingdon:—

Sir William Prescott & Co., London...	£5,175
R. & P. Cope, Saffron Walden	5,150
Wayman & Son, Over	4,510
W. Canham, Somersham	4,370
A. W. Allen & Son, Fenstanton	4,410
*M. J. Allen & Co., Ltd., Brampton ...	4,250

TIVERTON.—Fifty concrete houses for the R.D.C.

*Andrews and Miller, Uffculme.. £18,208

TONG.—Structural alterations at Tong-street Council School, for the Bradford Corporation:—

*F. Robinson.

TURTON.—Widening of Chapeltown-road, near Bromley Cross Station, for a length of about 400 lineal yards, for the U.D.C. Mr. V. W. Laithwaite, surveyor, Bromley Cross, near Bolton.

*W. Pollitt & Co., Ltd., Bolton £5,118

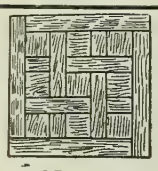
WARWICK.—Children's block and additions to the nurses' home at their hospital, for the Works Committee of the Warwick Board of Guardians:—

Building Work—	
*W. T. Nicholls, Ltd., Gloucester ...	£8,278
Electric Lighting—	
*Ellis & Ward, Ltd., Birmingham ...	242
Heating—	
*G. N. Haden & Sons, Ltd., Birmingham	920

WIGAN.—Extensions to the Adelphi Inn, Harrogate-street, for Messrs. Cunningham's Brewery of Warrington. Messrs. W. C. Ralph & Sons, architects, King-street:—

*J. Bickerstaff, Wigan.

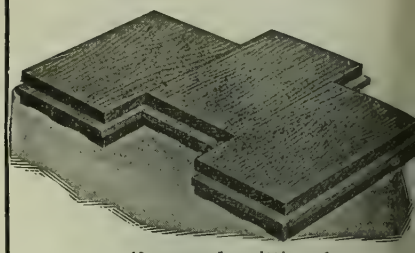
WOLSINGHAM.—10 non-parlour type houses, for the Weardale R.D.C.:—



*Beadle & Chapman, Bishop Auckland £4,040

WOODSEATS.—Working men's club. Mr. H. Webster, architect, Norfolk-row, Sheffield:—

*Moody & Redmile, Woodseats.



Roads Improvement.

In a statement issued recently regarding the Budget and the Road Fund, the Roads Improvement Association state that their policy is: "Removal of the hold-up of works of road improvement by the Treasury. The Minister of Transport (or his successor) to be authorised to anticipate and allocate the total estimated income of the Road Fund for the next five years; to enter into engagements to pay appropriate percentages of the loan charges incurred by highway authorities on all new works of road improvement undertaken by them up to the limits of the loan periods sanctioned by the Minister of Health."

CXXXII. No. 4,401. JUNE 10, 1927.

SOVIET ARCHITECTURE

considering the aspirations of the Soviet Government it may be asked what the new regime has accomplished in the sphere of art? A striking comparison is offered by the works of the French Revolutionaries who sought for the new by preng the sequence of tradition. As far as internal evidence the Soviet artists appear to favour the complete suppression of e and beauty. That this one-sided policy has had a considerable t on the arts of Europe is not too much to say. It is also true much of the unrest among the workers in this country can be d to the same root. Viewed retrospectively, it is now clear the world war was bound to have an aftermath, and as a natural lary the repercussions from the Russian debacle have found ession in architecture and art generally. Happily the more sed nations have withstood the shock of the social earthquake h became active in the midst of a nation half Tartar and half pean. At the time of the Revolution Russia was about to patch disastrous peace with the chief enemy to the peace of Europe. administrative capacity was at a low ebb; as a nation she was ically exhausted. It was not surprising, therefore, to the rest e world, that the pent-up emotions of four hundred millions of d nationality were not suppressed. The zealots in the cause eform proclaimed the opportunity for the oppressed masses se, and as was inevitable the intelligentsia for a time seized the tion of affairs. Then followed the debâcle, engineered by ists and fanned by self-seeking demi-gods who rose from the es of the people. The avowed aim of the reformers was to sweep r all traces of the ancient regime. Their ideal was to place social on a new and independent basis: their tenets advocated the tion of trade and the elevation of the individual to a status of lity with the heads of the State. How this theory has failed actice is well known.

he whole issue of Soviet rule is based upon hatred of class nction. It is not surprising, therefore, that the chaos which ed after the brief leadership of Kerensky has swept the whole of ia back to the days of Ivan the Terrible. All that Peter the t had worked for, all that had been accomplished under Czardom wo centuries, was irrationally disposed of in as many months. ches were destroyed, religion was prohibited, private property looted and morals were debased. The spectacle of a whole on engaged in a hideous saturnalia is not edifying. The abolition ligion, combined with a stranglehold on commerce, is not favour- to art. The leaders of the Revolution, engaged as they have in political differences, could not be expected to encourage art s finer aspects. A country lacking organisation, crying for food without the means to order its cultural activities on a broad s, is a menace to its neighbours. Art has always resulted from a non impulse for improvement. In primitive society it was ifested by small beginnings, conveniences, and aids to comfort. so history shows, progresses with society and draws its sustenance inspiring emotions. This elementary principle has not yet been ed by the leaders of the Soviet movement in Russia, who believe imerical methods. The truth is, the world to-day is too matured courage methods which strike at the very root of social progress. this reason the Revolution in Russia is bound to run its allotted se, and in time it will be replaced by a more reasonable and a more ane system of government. Then and then only will Russian art in health and vigour.

n years have passed since the early days of the Revolution, the time has now come for a review of the Soviet contribution rchitecture. Judging from the designs for civic buildings, h from time to time have reached this country from Moscow, im of the Soviet architect appears to be to bludgeon the rest of anity. For example, the Soviet pavilion at the Paris Exhibition 925 was an outstanding expression of the childishness, nay, r hopelessness of Soviet art. This building in design and con- tion symbolised the threat of the scaffold and the guillotine. spectator who had the courage to investigate the contraption nded one range of wooden steps and descended another; he me for the time a mere insect in a wooden triangle. The inner of this nonsensical structure was devoted to the display of peasant ery and similar products. Other recent designs from Moscow, h many of our readers will recall, appear to be devoted to that ies of Futuristic art which denies both the truth of structure the grace of form. Architectural façades have been committed to paper by Soviet architects showing a collection of windows and openings having no relation to plan. Fantastic silhouettes have been projected to take the place of the restrained lines of traditional art. It is true that in these designs time-honoured features are conspicuous by their absence, but so far nothing has been evolved to take their place. In the meantime, the stately palaces of Petrograd, Moscow and others are falling to decay. The mansions in the Crimea, the civic buildings of Odessa, as well as famous cathedrals and churches, are at the mercy of opportunists. The bright side of the picture is the preservation of the chief historic buildings of Petrograd, and the close conservation of the priceless works of European Art in the Royal palaces. Soviet art to Western eyes, like the Soviet rule, is a pricked bubble. Nothing so far has been contributed likely to have a lasting value either to Russia or to the world at large. The quest after specious originality in design on this showing affords an interesting parallel to the political situation. The mass of the people have merely exchanged one form of serfdom for another, and in art a similar process has been experienced. During the past two centuries, that is to say from the time of Peter the Great, up to the beginning of the European War, Russian art was inspired by the common traditions of Europe. There were the sub-issues of Byzantine art, and reflections from the Orient, but the chief inspiration was classic inspired by France. Even in those far-off days Russia in all things favoured the moods of Jekyll and Hyde. The peasant art of Russia was a thing apart, contact with hard facts such as were offered by the problems of agriculture and transport, as well as severity of climate, combined to evolve a domestic style almost mediæval in character.

The Soviet Government aiming at the destruction of the ancient regime in order to elevate its intimate supporters, has called into being immense forces which will surely sweep the present rulers into the limbo. The oligarchial system, even when formed of innumerable sub-sections, defeats the very object which it sets out to establish by arbitrary laws. There can be no liberty when all is liberty. With such facts in mind, and with full knowledge of the monopolistic aims of the Soviet authorities, is it reasonable that any importance can be attached to art emanating from Moscow? Russian art in its present phases represents the functional troubles from which that nation is suffering. A return to the old methods and sequences of art is not to be expected, even when sane government is restored. Perhaps in fifty years' time when art has been firmly re-established on lines covered with social security there will accrue an expression commensurate with the vitality of Russia, but until the time arrives Soviet art will continue its exploitation of oddity.

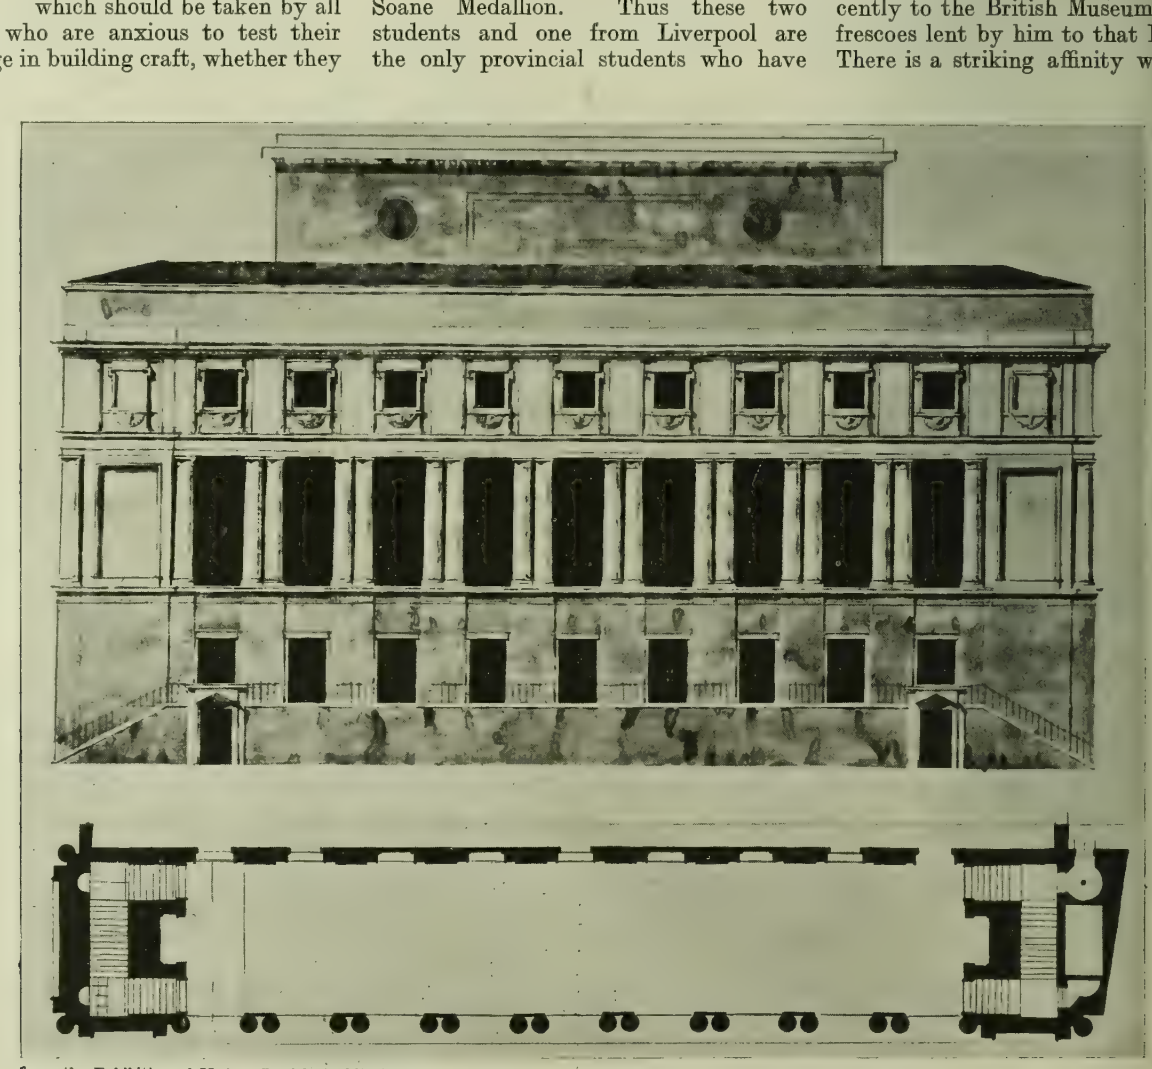
So much for Soviet art. There now remains to examine the effect of the Revolution upon the art of Europe. Up to the year 1914, European civilisation had fallen into the way of inheriting the legacy of the ages. Art had become a science of archæology, nothing was accepted as good unless chapter and verse could be quoted regarding its right to be. As a result, art became specialised and orchid like in its cultivation. In a world of potential realities there was little truth and much make-believe. Science had advanced enormously, but art had remained stationary. The world-war directed attention to methods of economy in the use of material, men began to appreciate direct statement, and polite expression gave place to bald facts. The cessation of hostilities, and the outbreak of the Revolution in Russia combined with labour unrest in all countries acted as a further deterrent to the continuance of obsolete methods. The nations which emerged intact from the war, but impoverished and enfeebled, were eager to reform internal social conditions. There ensued a wave of enthusiasm for new ideas, and men were found in every country ready to receive inspiration from any source whatsoever. Since those days there has occurred a general compromise between traditional art and more enlightened reasoning, but there has been a corresponding desire, in certain circles, for complete emancipation from the past. It is undeniable that some people have looked to Russia for the newer inspiration, but so far nothing has matured. Despite the cosmopolitan tendencies of life to-day, art must remain national in its general tone. As an expression of national character it affords the surest index to the state of a people. Given a broad basis of Government, a sweeping and universal interest, an ideal combined with high moral principles, art will flourish. It has never prospered at the call of a Government, and it has one attribute which is a constant, it cannot lie.

NOTES

The Parthenon Restoration.

It would seem difficult to resist the appeal which is made by M. Alexandros Philadelpheus in *The Times*, for the return of the cornice column of the Erectheum and the caryatid, to the Athenian nation, that they may be restored to their original positions. Though few of us may ever get to Athens to see them if re-erected there, we shall probably concede the right that Athens ought to have them, apart from the fact that their architectural value will be far better estimated in their old home than in the British Museum. At the same time it must not be forgotten that the preservation of these and the Elgin Marbles is probably due to the action of a British subject, an account of whose activities will be found in the articles by Professor Lethaby, which are appearing in the pages of *The Builder*.

London District Surveyorships.



It is to be regretted that more candidates do not sit for the R.I.B.A. Statutory Examination for the District Surveyorships of London, which should be taken by all students who are anxious to test their knowledge in building craft, whether they intend to apply for appointments as District Surveyors or not, as the examination is a strictly practical one, and the preparation for the examination is an excellent training. The London County Council are anxious to increase the number of architects qualified for appointment to District Surveyorships. All the appointments are to districts, the fees of of which amount to at least £1,000 per annum, and it is felt that were this fact better known many more practising architects would present themselves for examination by the Royal Institute of British Architects with a view to obtaining the certificate of competency required under Section 140 of the London Building Act, 1894. The appointments for which the Council invites applications by advertisement are, it should be noted, for the less lucrative districts, as it is the Council's practice to appoint the District Surveyors of proved capacity to the more lucrative districts as vacancies occur.

Provincial Successes.

We congratulate the South Wales Institute of Architects in having two of their students selected in the preliminary competition for the Soane Medallion. Thus these two students and one from Liverpool are the only provincial students who have been successful at this stage. T we need not make too much o result, we may remark that talen skill assisted by wise direction, no limits of time or place. Cer some of the best examples of m practice have hailed from the pro as well as work of outstanding from students.

Indian and Chinese Painting.

How much awakening is to the æsthetic impo of the art of the Far is shown in the in and appreciation for t hibitions of Chinese and Indian pa —one at the British Museum another at the Yamanaka Gallery New Bond Street. ad sing itions.

That very bad conditions of living exist in our midst is made clear by the investigations of the Westminster Survey Group, the t of whose work has just been l with the signature of Irene T. Barclay and Evelyn E. Perry. The report deals with a small but densely populated area lying between Buckingham Palace and the Thames. We can but sincerely hope that the result of this voluntary work of investigation will be to force the pace of amelioration, powers for which are amply sufficient, it is said. We quote below from the words of those who have entered on a crusade against this evil in our midst.

"In one street were found cottages which are 'damp and dilapidated, there is no water laid on indoors, and, therefore, no sink'; in another street, a house infested with 'sewer rats so numerous that within twenty-four hours of the laying of a new board, it was eaten through.' Leaking roofs, damp walls, vermin and sanitary defects are among the commonplaces of domestic life, and overcrowding is the worst evil; chapter and verse are given for instances of eight and nine persons, boys, girls and adults, living in two rooms, and it is stated that 'particularly numerous are families of 6, 7 and more members, including adult boys and girls, living in two rooms in tenement houses.' The report rests on unchallenged facts, and reveals grave shortcomings on the part of responsible elected bodies. It states concisely the powers which exist and which only need to be used, and it explains how an ineffective Borough Council can be stimulated to action. Exposure and publicity appear to be the one means to the cure of such conditions as are here described."

Palace of the Sultan, Marrakesh. (*See page* 922).

GENERAL NEWS

Professional Announcements.

Messrs. Howis & Belcham, architects and surveyors, of Southend, have opened a London branch at 77, Chancery-lane, London, W.C.2. They will be glad to receive catalogues and trade particulars at the new office.

Messrs. A. F. Scott & Sons, late of 24, Castle Meadow, Norwich, have removed to 23, Tombland, Norwich. The telephone number will remain as at present—Norwich 97.

Surveyor's Estate.

Mr. William Charles Willoughby, West Bridgford, Notts, auctioneer and surveyor, left £5,433.

Sir Duncan Rhind's Estate.

Lieutenant-Colonel Sir Thomas Duncan Rhind, K.B.E., A.R.I.B.A., of Grafton-mansions, Grafton-street, Brighton, architect, statistical adviser to the Ministry of Pensions, who died on April 24, aged 56, left unsettled property in his own disposition of the gross value of £1,074.

University of the South-West.

On Tuesday last, H.R.H. the Prince of Wales laid the foundation-stone of the art and administrative block of buildings of the University College of the South-West at Reed Hall, Exeter. While visiting his Duchy, he will also lay the foundation-stone of the new College Hall.

Artists' Memorial.

It is proposed to commemorate the eminent seventeenth-cenury Dutch artists, William Van de Velde the elder, and his son, William the younger, by inscribing their names on a stone in St. James' Church, Piccadilly, where they were buried. Surplus money subscribed will be devoted to charity. Contributions should be sent to the hon. treasurer of the Van de Velde Memorial Fund, Royal Naval College, Greenwich.

Birmingham Blue Coat School.

The Birmingham Blue Coat School, opened in 1724 and enlarged 70 years later, is to be acquired, subject to the consent of the City Council, at a cost of £120,000, to provide a site for the new headquarters of the Municipal Bank. The school will be removed to Harborne, where buildings on more modern lines will be erected. A portion of the Blue Coat School frontage to Colmore-row will be used for the widening of the thoroughfare.

Cambridge Regional Town-Planning.

At a recent conference at Cambridge of representatives of local authorities, at which the Rev. E. C. Pearce, chairman of the Cambridgeshire County Council, presided, it was decided to recommend the local authorities to set up a Regional Town-Planning Committee for the administrative county, consisting of representatives of the Cambridge Borough Council and each rural district council, with power to consult with representatives of the Cambridgeshire County Council and other bodies, the committee to be an advisory body to prepare a general report. Mr. G. L. Pepler, Chief Town-Planning Inspector to the Ministry of Health, who gave an address, mentioned that, since 1919, 45 regional town-planning committees had been formed, comprising 620 local authorities and covering 6,500,000 acres.

Elizabethan Plymouth.

Plymouth, it is reported, will probably succeed in saving the ancient buildings which occupy an area between the Barbican and the Citadel, and which at one time were threatened with demolition. Although picturesque, the area is admittedly overcrowded, and the difficulty, according to the *Times*, has been how to maintain the old buildings and at the same time carry out a housing scheme in accordance with modern sanitary requirements. A scheme which it is believed provides a solution of the problem has been passed by the Corporation and is now before the Ministry of Health, and it is expected that the local authority will receive the assistance of the Ministry in carrying it out. It is intended to be a reconditioning and repairing scheme which will preserve the historic character of the district and also comply with sanitary requirements. A satisfactory feature of the new design is that accommodation will be provided for more than two-thirds of the present number of inhabitants, which is a larger number than was contemplated in relation to the plans for the demolition of the ancient buildings and carrying out a housing scheme. It is hoped to convert one of the Elizabethan houses in the area into a museum.

Scottish Ancient Monuments.

The seventh list published by the Commissioners of Works of monuments "reported by the Ancient Monuments Board as being monuments the preservation of which is of national importance, and such others as the Commissioners think ought to be included in the list," contains the names of the following monuments in Scotland:—Berwickshire.—Preston Cleuch Fort, Bunkle and Preston; Coldingham Loch Fort; Earn's Heugh Forts, Coldingham; Cockburn Law Fort, Duns; Blackcastle Rings Fort, Greenlaw; fort, 300 yards N.W. of Raecleugh Head Farm, Langton; Raecleugh Head Hill Fort, Langton; Addinston Fort, Lauder; Longcroft Fort, Lauder; stone circle on Borrowston Rig, approximately 1 mile N.E. of summit of Dabshead Hill, Lauder; "Mutiny Stones" (long cairn), on Byrecleugh Ridge, ¾ mile N.W. of Byrecleugh, Longformacus; "The Mount" (mote hill), 200 yards S.E. of Castle Law, Coldstream; Crosshall Cross, Eccles. Fife.—Collairnie Castle, Dunbog. Kirkcudbrightshire.—Sculptured rock on Trusty's Hill, Anwoth; two cross slabs near the summit of Braidenoch Hill, Carsphairn; two sculptured stones at N.E. corner of the ruined church of Minnigaff. Perthshire—"Standing stones of St. Madoes," in the Park of Pitfour Castle.

ROYAL ACADEMY EXHIBITION, 1927.

MR. ALBERT TOFT, F.R.B.S., Sculptor.

COMPETITION NEW

COMPETITIONS OPEN.

Shakespeare National Memorial Theatre, Stratford - upon-Avon. Competition open to architects of the British Isles and America. To be held in two sections: first, Sketch Designs, from which six will be selected, and the authors each paid £100 towards cost of preparing more detailed schemes, which will form second part of competition. Selected architect will be paid in accordance with R.I.B.A. schedule of charges. Apply Secretary, Shakespeare Memorial Theatre, Stratford-upon-Avon. Deposit, £1 1s. Assessors, Messrs. Robert Atkinson, F.R.I.B.A., E. Guy Dawber, P.R.I.B.A., and Cass Gilbert.	Particulars published in "Builder." Jan. 14
Lay-out and architectural treatment of approaches to the Palais de Justice, Brussels. Apply M. Le Conservateur du Palais de Justice, Brussels. International competition. No premiums offered, but successful competitor to be remunerated on Belgian scale.	Mar. 18
Civic Improvements, Birmingham, around Hall of Memory. International Competition Premium of £1,000 will be awarded author of design placed first. Further sum, not exceeding £1,000, will be divided among other competitors according to assessor's recommendation. Scheme includes: Municipal Offices, to contain City Hall, Public Library, and Lord Mayor's Mansion House. Mr. H. V. Lanchester, F.R.I.B.A., assessor. Apply Mr. Herbert H. Humphries, City Engineer, Council House, Birmingham.	Oct. 15
Grammar School, Bradford, 1,000 boys. Premiums: £300, £200, and £100. Mr. Arnold Mitchell, F.R.I.BA., assessor. Apply Mr. W. Brear, Secretary, Grammar School, Bradford, Yorks. Dep. £1 1s.	Feb. 18 and Mar. 4
Edwin Austin Abbey Memorial Scholarships for Mural Painting. Two Minor Scholarships of £125 a year each, and one Major Scholarship of £250 a year. Candidates must not be over 25 and 27 years of age for the respective Scholarships on December 31 preceding the competition. Apply Secretary, Edwin Austin Abbey memorial Scholarships, Chelsea Lodge 42, Tite-street, S.W.3	June 11
Cemetery Chapel, Reading, for Corporation. Open to architects residing or practising in Berks, Bucks or Oxon. Premiums: 50 and 25 guineas. Apply Borough Surveyor, Town Hall, Reading. Deposit, £2 2s. Mr. Charles J. Blomfield, F.R.I.B.A., Assessor, 13, Ashburn-gardens, London, S.W.7, to whom designs have to be sent.	April 15
University Buildings, Western Australia. To cost £150,000. Premiums: £400, £300, £200. Open to British subjects or citizens of U.S.A. Assessors: Professor Leslie Wilkinson, F.R.I.B.A., Mr. A. R. L. Wright, L.R.I.B.A., President Royal Institute of Architects of Western Australia, and Member of University Senate Apply Agent-General for Western Australia, "Savoy House," 115–116, Strand, London, W.C.2, or Australian Trade Commission, 44, Whitehall-street, New York, U.S.A.	Jan. 14

Architecture in North Africa.

Sir Aston Webb, R.A., & Son, Architects.

ARCHITECTURE: A RECREATION

By MANNING ROBERTSON.

With the acceptance of the principle of town planning the province of architecture has spread far beyond the confines of bricks and mortar, and, under the comprehensive term Civics, we find the architect occupying a co-ordinating position in public life and manners. This widened sphere of influence should react favourably both upon the profession and upon the public but, if this large-scale co-operation is to be properly effective, the architect should, in fairness, be allowed a start, that is to say, he should be given a reasonable opportunity of presenting architecture—in its live civic sense—to the child. At present, if anyone suggests the word architecture as a definite school subject he is met with the inevitable reply: "Look at the school curriculum; how is it possible to cram in yet another subject?" Thus the medium which should co-ordinate civics, art, history, and mathematics is branded as technical and is never read for a pass degree by anyone who does not intend definitely to practise as an architect. History, languages, classics, law, and science are constantly studied as cultural university subjects, while architecture remains outside, as specialised as medicine or engineering.

If this attitude persists the true functions of architecture as a cultural influence must remain dormant, because those responsible for civic amenities have to deal with a public that is uneducated and therefore uninterested, and swayed only by prejudice. A definite campaign of propaganda by the Board of Architectural Education would appear urgent, but, pending a wider scheme in which teachers of architecture will co-operate officially at the Conference of Educational Associations, we should do well to consider what could be effected outside school hours as a recreation, by arousing the interest of boys, girls, parents and teachers. Broadcasting and the cinema at once occur to one as excellent channels for arousing interest in the public generally. Speakers could no doubt be enlisted and pictures of great buildings projected, but on what principles are they to appeal? Put crudely, are we sure that they would attract and not bore their audiences? The danger of such an effort failing through ineffective presentation is very real and would leave the position worse than it is now. In the past architecture has been presented through one medium only—the completed historical and monumental—conveyed to the student in two ways. The first projects a well-known building as a whole, presenting a complexity too great to be grasped; the second exhibits the work as a series of façades, sub-divided into an array of bewilderingly technical details. The inherent weakness of such presentations lies in the attempt to instruct backwards rather than to awaken and guide from first principles. Further, this method has been largely responsible for the prevalence of the conventionalised architectural mask, whereby certain set forms are accepted as suitable to express dignity and importance in large buildings.

If we are to stimulate interest among the many other competing attractions of cinema and loud speaker we must surely seek for a different presentation and show architecture as it is, born and grows to-day, describe the materials which it embodies, explain the construction upon which its form depends, emphasise how it relies for character upon plan and function, and above all demonstrate how it—alone among the arts—unites the æsthetic elements of design and proportion, flat and solid, colour and shadow. This is not to suggest that the great historical sequence and tradition should be ignored; it would, on the contrary, be introduced constantly as a further incentive to interest. No teacher would begin teaching a child to draw by inviting him to gaze at reproductions from the Sistine Chapel or the Prado, and there can be no reason why architecture should be approached by beginners through finished buildings. The child who can recognise hand-made from machine-pressed bricks, and who has observed how they are coursed in a wall, who has grasped the reactions of the arch and its play upon the buttress and pinnacle is on the way to realise architecture. If he has further become interested in the elements of proportion, grouping, texture and colour, he is awakened to an outlook on his surroundings that will not allow him to stand still. In order to arouse appreciation it is necessary to begin with recognition.

Take a party of children to Westminster Abbey. They will be awed by the size, darkness and majesty; the association with the past will impress them enormously; they will leave it with a general feeling of bewilderment, a more or less exact recollection of a few details, and the certainty that "architecture" is beyond their comprehension. Ask them to write an essay on their visit and they will probably regret that someone doesn't build "just like that now," and they will almost certainly accept modern pseudo-Gothic as the only "style" appropriate for worship. The architectural value of the experience will be practically nil, although the historical and poetical reaction may have a real value. To make such a visit architecturally useful we should first have taught the children, through practical demonstrations, the constructive principles that underlie the arch, vault and buttress. We should have shown them how to construct an arch for themselves with models, and seen how the thrust of an arch entails collapse unless the thrust is counteracted. We should have reminded them how the mediæval builders valued their craft details, and shown them the tool marks on the stones by studying a few Norman and Early English stones with care and intelligence. Thus they would carry from their visit not only a noble general impression but also a sense of how men in olden days tackled a definite problem. If you take a party of children trained on these lines to see a corner of Hampstead, Bellingham, or Welwyn Garden City they will discover points in construction, craft and human interest that will fit into the architectural framework that they will have formed for themselves.

Perhaps the fact that architecture is at present barred as a class subject may result in its ultimate liberation. If we are not permitted to force children in the classroom to learn something of its beauty we can only try to attract them voluntarily, and to persuade their elders of the diverse interests that it can open up. In this way, why should not architecture be added to the tests of Scouts and Guides? It could even be presented in two forms, Practical and Historical, with a higher course of Civic Architecture, in which both the elementary courses would be merged. Measuring-up is an excellent exercise, possible indoors or out, and if carefully carried out and scheduled, such measured drawings might prove of genuine local value as records of interesting minor buildings that are in danger of demolition. It would also lead to a knowledge of local characteristics that would help to counteract the present-day movement towards standardisation that threatens to submerge all local character.

Arles.

GRAECO-ROMAN ANTIQUITIES OF PROVENCE

In the first of his three lectures, delivered in French at Bedford College recently, Monsieur Frederic Mistral devoted himself to the subject of the Graeco-Roman antiquities in Southern France. He pointed out that Provence was at the same time Greek and Roman, and that no comparable monuments existed outside Rome itself. Speaking with the restrained fire characteristic of the Provencal, Monsieur Mistral drew vivid word pictures of the blue skies of the *Midi* against which arose the columns, the arches, the pediments, combining the constructional splendour of Roman with the more delicate beauty of Greek architecture. In very early times intercourse between the maritime borders of Provence and the coasts of Asia Minor, as well as Greece itself, produced in the indigenous population, of short, dark fishers and hunters, characteristics, ways of thought and expression which have persisted in their descendants of to-day. The founding of Marseilles was wrapt in the mists of legend, though its cosmopolitan nature is of ancient date. The probable founding of the Roman city of Marsilia was about the fourth century, and its basis was commerce. Further inland the thermal waters of Aix were naturally appreciated by the Romans, and so Roman culture played an important part in the development of that town. Caesar contrasted the culture of Provence with the barbarism of Gaul. Arles was a town of Greek origin, and was accorded special privileges under the Romans. In Arles the influence of Hellenic culture was evident in the character of its architectural ornament, and even in structure, as well as in sculpture. In the amphitheatre at Arles stone lintels of Greek character appeared, while arched construction was completely predominant at Nîmes. From the theatre at Arles, with its two beautiful columns still standing, came the monoliths now built into the cloisters of St. Trophime. These examples, as well as the exquisite Maison Carrée at Nîmes, were shown on the screen, and also the Tour Magne, the Thermae and the temple of Diana. In the Musée Lapidaire at Arles the wonderful examples in stone and marble showed the excellence of the plastic arts in Graeco-Roman Provence. The Alyscamps at Arles, where the carved sarcophagi of Christians and pagans lined the peaceful glades, was also illustrated, and the two columns remaining from the Forum, the obelisk from the Circus, now near St. Trophime, and finally some fine views of the Pont du Gard. The beauty as well as the constructional skill of this was well described by the lecturer. Mention was made of other Roman relics at Frejus and elsewhere in Southern France and of the Arc de Triomphe at Orange where the military history of the time of Constantius and Septimus Severus was recorded. The lecturer remarked that the amphitheatre at Orange had not the grace of that at Arles, for Orange lacked that direct contact with Greece which was experienced at Marseilles and Arles, both before and during the Roman domination.

NUAL CONFERENCE OF COTTISH ARCHITECTS

ne eleventh Annual Convention of the rporation of Architects in Scotland was at Elgin on Friday, June 3, Mr P. K. Young, F.R.I.B.A., Perth, the ident, occupying the chair. Over eighty bers were present from all the principal res in Scotland. The proceedings opened a civic reception in the Town Hall, hich a cordial welcome was extended to Incorporation by Lord Provost Wittet, is himself an architect. At the outset, Lord Provost read a telegram from the B.A., sending cordial greetings to the tish Convention, and expressing the wish the gathering might be a successful one. inuing, the Lord Provost said Elgin was ty which had many associations with itecture, past and present. The Castle Cadyhill and the Cathedral took them to the twelfth and thirteenth cen-s. They had had also in the town a astery of Black Friars, which had now wiped out, but they still had the nants of the Greyfriars Church and estic buildings. Touching on the clas- revival, the Lord Provost mentioned r's Hospital, built in 1816 by Mr. spie, a well-known Edinburgh architect is day. In 1828, the old Gothic parish ch having become ruinous, a new sical church was built in the centre of High Street, with a very fine portico at west end, and the towers surmounted by odel of one of the beautiful monuments he Hill of Athens. This building was gned by Mr. Simpson, a well-known deen architect of his day. Another inent Classical building of the period, erson's Institution, built in 1830, differed haracter from the others, but was also esign of Mr. Simpson. These three lings formed prominent features at the s and west ends, and in the centre of cown.

r. George Young, F.R.I.B.A., Perth, ident of the Incorporation, in ning thanks for the civic welcome, essed the pleasure of the members in ng a professional brother and colleague coying the civic chair. He congratulated Provost Wittet on his recent election ie Fellowship of the Royal Institute.

the annual meeting which followed, chairman reported that the secretary and surer, Mr. W. Glassford Walker, C.A., burgh, had tendered his resignation, that Mr. A. Nicol Bruce, Edinburgh, been appointed in his place.

e report of the council for the session 26-27, stated that the council had com-ioned Mr. John M. Aitken, A.R.S.A., to ite a portrait in oils of Sir Rowland erson, the founder and endower of the poration. The report of the treasurer ad that the surplus funds at the end of year amounted to over £200.

. Young, Perth, was unanimously ed president for the ensuing year, while efollowing three Incorporation represen-es were appointed to the council for the sing year:—Mr. A. G. Henderson, H.B.A., Glasgow; Mr. James Lochhead, H.B.A., Hamilton; and Mr. T. F. annan, F.R.I.B.A., Edinburgh. Mr. J. A. Drummond, Edinburgh, was nted auditor.

accepting re-election as chairman, Mr. g referred to the Registration Bill now e Parliament. The result of the efforts n were being made, so far as the im-ate success of the Bill was concerned, be uncertain, but one thing they could no doubt about was that the over-ming majority of those within the pro-sn were favourable towards such a re, and had combined to an extra-dary extent to express their approval e definite line of action which had been up by the Royal Institute.

It was decided to hold next year's Con-on in the district of the Edinburgh ter, and a committee was appointed to make the necessary arrangements. At the close, the gold medal awarded by the Royal Institute of British Architects for the best specimen of street architecture in Scotland, was presented to Mr. John Watson, of the firm of Messrs. Watson, Salmond, and Gray, Glasgow, in respect of the Glasgow Municipal Buildings extension. Mr. Watson accepted the medal, along with a diploma, on behalf of his firm.

Members and friends afterwards dined together in the Station Hotel. On Saturday, June 4, the members visited a number of notable buildings in the county, including Elgin Cathedral, Greyfriars Church, Elgin, and Birnie Kirk, and afterwards lunched at Cluny Hill Hydropathic, Forres.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks or correspondents, who will oblige us if they will express their views as briefly as possible.]

Government Architects and Private Practice.

Sir,—First let me thank you for the kindly reference to myself in last week's BUILDER.

In my speech at the annual general meeting of the R.I.B.A. on May 2 last, I referred to the fact that the Office of Works—initiated solely for the upkeep and decoration of our public buildings and Royal palaces—had now grown into a huge architectural and building bureau, detrimental to the interests of the architectural profession.

I had heard, what I thought was only a rumour, that certain official architects in the Office of Works had, in addition to their full, permanent salaries (with pensions to follow), been permitted to undertake "private practice"; the fact was, however, brought to light by the pertinent questions of two members in the House of Commons (Mr. Hopkinson and Mr. Morrison), addressed to the First Commissioner. The debate is published in the current issue of THE BUILDER, and may be summed up in the following question asked by Mr. Morrison, viz.:—"Does the hon. gentleman think that an architect who is a full-time employee of the Government has sufficient spare time to undertake the architectural work of a contract for £1,000,000?" The reply by Captain Hacking is somewhat startling: "Yes, sir, I do."

In your leading article for May 27, you observe: "The Institute is a body which exists for the purpose of fine architecture and the prosperity of architects"

One does not expect much "fine architecture" from a Government bureau, and it certainly does not point to the "prosperity of architects" that these highly paid officials should be allowed to indulge also in "private practice" to the extent of a £1,000,000 job!

I am writing to the R.I.B.A. on the subject, suggesting immediate strong protests to the Office of Works and every endeavour to stop the practice at once

WM. WOODWARD.

Hampstead.

SIR,—The report, which appears on page 900 in your last issue, of the discussion in Parliament on Wednesday last week on the above subject is interesting and calls for further explanation. We can only assume that this debate must have taken place after lunch. Does Capt. Hacking expect us to believe that a Government architect employed as a whole-time official can undertake a private contract of one or two million pounds under the conditions stated:—

(1) The work must not be undertaken during official hours.

(2) Name plates must not be fixed on outside offices or private residences.

The use of official premises in connection with private business was not allowed on any conditions, even after official hours, and on the clear understanding that it must not interfere with the proper execution of Departmental duties.

It would be interesting to know how a contract of even a hundred thousand pounds could be conducted under these conditions. Where does an architect without a business address meet his clients, contractors, clerk of works and other agents connected with the carrying out of any such work?

Is it customary for an architect to meet these necessary individuals before 10 a.m. and after 5 p.m., even if such a nameless place could be found? Capt. Hacking might explain how all this is done. Some of us would like to try it.

It is no wonder that Government service is so popular when taxpayers are willing to subsidise their servants in this manner to their own (the taxpayers') great loss. It would be extremely funny if it were not such a glaring injustice.

The Royal Institute of British Architects for some strange and unaccountable reason does not seem to have realised that a clause in their code of conduct covers this reprehensible practice. They owe it to the great majority of their members to deal with this question as soon as possible as the evil is spreading more and more every year. There must be some reason for the long delay in dealing with it, but what that reason is is beyond the mind of the ordinary man.

AT SPES NON FRACTA.

EXHIBITION NOTES

THE WALKER GALLERIES.

THE interesting collection of excellent water-colour and pastel drawings by Mr. E. W. Powell at the Walker Galleries in Bond-street should give pleasure to the general public as well as the critic, for they have an air of ample directness of intention in setting forth the charm of landscape, added to a decided colour value. The hand of the artist works with assurance and decision, and the result shows something of the repose of nature, free of any obviously theatrical methods. Many of Mr. Powell's friends will be securing these drawings, and the prices are remarkably moderate. We may love to see more vivid work in colour and more abandon and freedom in the handling, but we cannot deny the genuine accomplishment we see here.

Historic Paris House Saved.

An arrangement has been made by which the Hôtel de Massa, in the Avenue des Champs Elysées, an old and historic private house which was threatened with complete demolition, is to be taken down stone by stone and rebuilt near the Porte de Neuilly, on a site made available, in the old military zone of Paris. It will then become the headquarters of the Société des Gens de Lettres. The house, which stands in a garden at the corner of the Rue de la Boëtie, was bought some months ago by one of the large stores of Paris with the intention of building a branch shop on the site. On representations being made in opposition to this destruction of a building of interest and beauty, M. Herriot protected the house by classing it as a "historical monument" within the meaning of the Act.

Rebuilding Abingdon Bridge.

A tender has been accepted by the Berkshire and Oxfordshire County Councils for the rebuilding of Abingdon Bridge at a cost of £20,953. The main arch will be constructed in reinforced concrete and faced with natural stone to harmonise, as far as possible, with the existing masonry. The remaining part of the bridge, between the island and the navigation arch, will be extended, and the two small navigation arches will be rebuilt, the same arch stones being used and preserving the character of the arches.

L

SYMBOLISM IN INDIAN ARCHITECTURE

By V. B. Metta.

It is impossible to understand Indian art without some knowledge of Indian philosophy, because art is more closely associated with philosophy in India than perhaps anywhere else in the world. Indians use a great deal of philosophic symbolism in their architecture, and anyone who wishes to study Indian architecture should know what the Indian symbols stand for. Among the most prominent of these symbols is the lotus, which is used both decoratively and structurally in Indian buildings. It is the symbol of Hinduism, as the Cross is of Christianity and the Crescent of Islam. As it springs from mud, it conveys to Hindus the idea of the evolution of the Cosmos from Primeval Chaos. Its bell-shaped fruit made them think of the Hiranyagarbha, the Womb of the Universe, in which millions of worlds are waiting to be born. The lotus on which the Indian gods and goddesses sit or stand is the symbol of the material universe. The open lotus flower, which is a symbol of the sun, is used extensively in the Buddhist stupas and other buildings. The Indian dome often means to Indians this planet or the sky. It rests on lotus leaves at its base, and is crowned by the mystical eight-petal lotus, known as the Mahapadma, which is a symbol of God. Above this eight-petal lotus comes the kalasha, the water-pot, which symbolises the creative element. The finial above the water-pot in Buddhist times was the chakra, the Wheel of Law. The dome of the Buddhist period gradually assumed a bell shape, because the sight of a bell immediately puts one in mind of divine worship. The Taj Mahal and some other buildings have five domes—a large central one and four smaller ones surrounding it. These five domes are called the Panch Ratna, the Five Jewels; and the building which has them is considered to be the shrine of the Five Elements—Fire, Air, Earth, Water, and Ether.

There is a saying in India that "the arch never sleeps." It means that the Hindus had found out the instability of the arch, and so they preferred to use trabeate structure. But the fact that they did know the use of the arch, both decoratively and structurally, is clear from ancient Indian architecture. The trefoil arch is to be found in some of the Buddhist caves. It resulted most probably from a combination of the pipal (*ficus religiosa*, under which Buddha received the Great Enlightenment) and the lotus leaves. A seated Buddha was often placed within it, and so it represented the aura emanating from Buddha's body. Then, again, what is called "the horse-shoe arch" (introduced in Europe by the Saracens in probably the eighth century) was used in old Indian caves. It was a symbol of good luck, not because it was like a horse-shoe in shape, but because it resembled the lotus leaf. The horse-shoe arch windows in the caves symbolise the sun rising or setting on the rim of the ocean. The heads of fishes are often carved at the base of these windows, in order to make the idea of the ocean more clear.

The pillars in Indian architecture are dominated by the lotus, for its flower and fruit are used in their capitals and bases. Mr. Havell, after a careful study of the subject, has come to the conclusion that the square-shaft pillars are associated with the worship of Brahma, the octagonal pillars with the worship of Vishnu, and the circular or the sixteen-sided pillars with the worship of Shiva. In Buddhist architecture the square pillars represented Buddha, the octagonal ones the Church, and the circular ones the Law. The cylindrical pillars without a capital or base are associated with the worship of Chandra, the Moon God.

The stupa had originally no religious significance at all. It was probably used by the Turanians before the Aryan invasion for the burial of their dead. Some time after the death of Buddha it was transformed into a reliquary, and so it became an object of worship. It had four gateways, looking towards north, south, east and west respectively. The railings round it had often three bars, which symbolise the Buddhist Trinity. Mr. Havell is of opinion that they also symbolise the three times of daily prayer, which is not unlikely. The reliquary was placed on the crown of the dome; and above the reliquary was the Tee, which symbolised the pipal.

The observant traveller in India notices that the temples dedicated to the worship of Vishnu are different in form from those which are dedicated to the worship of Shiva. The reason for it is as follows: As Vishnu is, among other things, the symbol of the sun at its zenith, so his temples have a sikhara (spire or tower), with its soaring lines. Shiva, on the contrary, represents sunrise or sunset, and so his temples are built horizontally with a dome above them. Then, again, the Vishnu temples have only one door, which faces the east, probably because the east signifies health and preservation. The Shiva temples have also only one door, but it faces the west, because Shiva represents the Destructive Force of the Universe. The temples of Brahma, of which very few are now left in the country, have four doors facing the four cardinal points, because, as the Creator, he looks in all directions. It has also been remarked by certain writers that the Indian temples are built to s the style of the image contained within th If, for example, the image is standing, then temple is tall and soaring; but if the imag seated then the roof of its temple is domi It cannot, however, be said that this idea always been put into practice.

There are many symbols used decorativ in Indian buildings. The fight between G and Evil, symbolised by the churning of Ocean of Milk by the gods and demons fi opposite sides, is often sculptured in th Then, again, is found the representation of asoka tree blossoming when touched by a yo maiden, who is the symbol of Spring. serpent is a symbol of both Good and E He is a protector when his hood is above head of the seated Buddha, but he is a destro when twined round the neck of Shiva. dance of Shiva symbolises the movement Matter for making new forms when it comes contact with the Universal Spirit. The Trimu the Hindu Trinity, symbolises the forces Creation, Preservation, and Destruction mediately followed by Transformation. Swastika is the symbol of moral regenera and happiness, and the trisul—a three-pron instrument—is the symbol of the Budd Trinity

Moorish Garden, Marrakesh. (*See page* 922).

SOCIETIES AND INSTITUTIONS

R.I.B.A.

Following are notes from the Minute the Council, May 16 :—

Mr. E. Guy Dawber, A.R.A.—The co congratulations of the Council were conv to the President upon the honour whic had received by his election as an Asso of the Royal Academy.

Libraries of Schools of Architecture. was agreed to renew the grant of £100 t Board of Architectural Education and Allied Societies' Conference for the prov of additional studio text-books for use students of schools and of allied soci which have an inadequate supply of books.

Future Work of the Art Standing C mittee.—With a view to reducing the nu of Institute Committees, it was decide hand over the work of the following com tees to the Art Standing Committee :—

(1) The Exhibition Joint Comm (with power to co-opt additional mem who are not members of the Art C mittee);

(2) The London Architecture M Jury (with power to co-opt laymen representatives of the bodies at pr represented on the jury).

University of London Centenary Cel tions.—The President was appointed to re sent the R.I.B.A. at the University of don Centenary Celebrations to be held June 23.

The Architectural Association.—It agreed to renew the annual grant of £1(the Architectural Association for the 1927.

International Standards of Measureme Building and Engineering Components. the recommendation of the Science Stan Committee, the following resolution passed and forwarded to the British E neering Standards Association :—

"That the Council of the Royal I tute of British Architects are of op that any steps taken to introduce i national standards of measuremen building and engineering components be to the ultimate advantage of Br industry."

Conditions of Contract Conference.—M Harry Barnes and Mr. Maurice Webb appointed as additional representatives o R.I.B.A. on the Conditions of Contract ference.

The Fellowship.—The Council, by a u mous vote, elected Mr. John W L.R.I.B.A., President of the Inverness A tectural Association, as a Fellow under

vers defined in the Supplemental Charter 1925.

Studentship.—The following were elected dents of the R.I.B.A. :—Adair-Thompson, L. (Architectural Assoc.); Brodie, A. (Architectural Assoc.); Bull, H. A. (Technical l., Cardiff); Fogden, J. (Leeds Coll. of); Maitland, R. W. (Architectural Assoc.); berts, L. H. B. (Architectural Assoc.); nley, Theodora Christine (Architectural oc.); Sully, C. W. (Architectural Assoc.); nkyns, H. G. (special exemption); Turner, rozsha R. (Bombay School of Art); Wilns, L. P. (Architectural Assoc.).

Resignations.—The following resignations e accepted with regret :—S. F. Bartleet, .I.B.A.; G. Benson, A.R.I.B.A.; A. C. croft, A.R.I.B.A.; J. F. Chambers, R.I.B.A.; H. J. Yorke, L.R.I.B.A.

Application for Election as Subscriber.— application was approved.

Application for Election as Licentiate under tion III (f) of the Supplemental Charter 1925.—One application was approved.

Application for Transfer to Retired Fellow-.—The following member was transferred he Retired Fellowship :—E. A. E. Wood-, elected Associate 1881, Fellow 1905.

E SOANE MEDALLION AND THE TITE PRIZE.

Final Competitions.

As a result of the Preliminary Competiins for the Soane Medallion and the Tite ze, the following have been selected to e part in the Final Competitions:—

The Soane Medallion.

S. G. Chaplin, Bartlett School of Architecture, University of London.
E. F. Davies, School of Architecture, niversity of Liverpool.
Raymond Erith, Architectural Associaion.
D. H. McMorran.
Leonard Monroe, The Technical College, ardiff.
W. B. Oldacre.
W. Percik, Architectural Association.
J. W. Wood, Architectural Association.
J. B. Wride, The Technical College, ardiff.

The Tite Prize.

A. G. Armstrong, Northern Polytechnic, ondon.
H. I. Ashworth, University of Manhester.
A. Bailey.
W. G. Benoy, University of Manchester.
J. W. Buchanan, Architectural Associaon.
R. M. Butler, Birmingham School of rchitecture.
E. J. Carter, Architectural Association.
P. J. Doran, University of Liverpool.
E. J. Harrison.
H. A. Hunt, Northern Polytechnic, ondon.
Allan Johnson, Leeds College of Art.
C. H. Jones, University of Cambridge.
B. St. C. Lightfoot, University of iverpool.
J. L. Martin, University of Manchester.
Patrick McNeil, Glasgow School of rchitecture.
Alec Owen, University of Liverpool.
J. W. Parr, Architectural Association.
s C. W. Preston, Architectural Associaon.
J. R. Tolson, Leeds College of Art.
Walter Watson, Birmingham School of rchitecture.

DEVON AND CORNWALL A.A.

pening an exhibition of prize drawings at nouth free library, on Wednesday, 25, Mr. A. C. A. Norman, President of Devon and Cornwall Architectural Asso-on, drew attention to a studentship in itecture won by Miss Ruth Ellis. Women ents, he said, were following closely on heels of the men, and the latter would e to look to their laurels, or they would that the plums of the R.I.B.A. would be n from them.

r. W. A. Vercoe moved a vote of thanks to Mr. Norman, which was seconded by Mr. C. Cheverton, who said he trusted the public men of the town would pay the exhibition a visit, as it would open their eyes to the fact that it needed more than a surveyor's training to make a good architect.

The drawings, which were placed on view for a week, were arranged in the lecture room by the Borough Librarian, Mr. Cole, and the Secretary of the Plymouth Branch of the Devon and Cornwall Architectural Association, Mr. B. Priestly Shires. Mr. Cole also prepared a list of books in the library which were suitable for students.

THE SURVEYORS' INSTITUTION.

The following examination results are announced in connection with the Devon and Cornwall branch of the Surveyors' Institution.

Intermediate examination (students) : R. M. Barraball (Launceston), D. J. Bendle (Exmouth), F. K. Castle (Marytavy), C. W. E. Drew (Paignton), W. A. Knowles (Launceston), R. F. J. Lawn (Redruth), who secures the Beadel Prize, E. C. Stratton (Plymouth), and W. E. Tozer (Bideford).

Intermediate examination (non-students) : B. Ayear (Exeter), R. W. Channon (St. Mellion), F. C. Otton (Barnstaple), A. Palfrey (Exeter), and H. Ward (Brentor).

Final examination (qualifying for membership of the Institution) : W. L. Primmell (Plymouth), R. J. Fare (Exeter), and W. K. Welton (Paignton).

NORTHERN POLYTECHNIC.

A SCHOLARSHIP, value £50 per annum for two years, tenable at the School of Architecture, Surveying and Building, Northern Polytechnic, has been offered by the Leeds Fireclay Company, Ltd., for the promotion of the study of terra-cotta. The preliminary stage of the competition for the scholarship has been held, and the following students have been selected to take part in the final stage :— Mr. E. W. Clark, Mr. C. S. Oakes, and Mr. J. Singleman.

CENTRAL SCHOOL OF ARTS AND CRAFTS

Exhibition of Students' Work.

This exhibition is becoming an important annual affair to all those interested in the development of sound craft practise, and the Advisory Council are fortunate in having secured such well qualified instructors, through whose teaching so creditable a state of affairs is to be observed. The instinct for craftsmanship, which is really common to all, is fostered along lines of practical usefulness, and the students' own characteristics are given free development, without imposing too theoretic a system of training. So we see the play of individuality under reasonable control, working within the conditions that the materials impose, with the result that a certain vivacity and enthusiasm pervade the exhibition.

The subjects of instruction cover a wide field, which includes architecture, modelling, silversmithing, jewellery, furniture, stained glass, weaving, printing, etching, embroidery, etc. The architectural section should not be overlooked, as it is so important this should be on sound lines, and the thoroughness of the training given at the Beaux Arts, Paris, is reflected in the teaching at this school. This advance on the old more academic training, when the student was set to design "classic temples" in the air, out of touch with the actual conditions governing his future practise, is avoided, and instead a more practical direction takes its place. Limits of space permitted of no more than a few of the plans and elevations worked out being shown, but the method adopted was that of a scheme under which the students were set to prepare working drawings to a given site. The lay-out having been made by two or three students of the class, on a site previously selected, it was then apportioned in blocks among the students to prepare plans for the different buildings—a church, a library, schools, blocks of flats, cinema house, etc.—with precise information as to the accommodation and general requirements. The student was not therefore left to wander in a field of abstract composition, but kept within the actual conditions of building. The result of this very interesting method is at once evident, and though we do not claim for the results any special originality, or distinction in design, the drawings show ability, while their educational value can hardly be over-estimated. When it is remembered that this architectural class is only held in the evenings, the working drawings reflect much credit on the direction. A design for a stone screen for Waterloo Place should be noticed, and another for a country vicarage, and here again the designs are prepared for actual sites. We call special attention to this class, which, for its technical interest, should be atractive to our readers.

In a brief review of the various sections, it is difficult to do justice to the many examples of work deserving praise. A very interesting section is that devoted to the pottery class, which has become rather a special feature of the training given. The "lustre" is perhaps a little coarsely applied to the ware, and a little more sensitiveness is desirable. The decorations imposed on the pots themselves tend to be a little perfunctory, and we would like to see a little more attention paid to this also. On the other hand, the covered pot by Miss Cayley Robinson shows the advantage of more appreciation, and both form and decoration are harmoniously combined. With the admirable pottery shown by T. K. Parsons, M. K. Vowles and D. N. Harding we are already familiar, and T. Salaman and S. Finnimore also show excellent examples. The elephant in glazed earthenware by C. M. Stockdale is a first-rate example.

The three carpets shown are hardly as good in colour as we could wish, though the larger one is, on the whole, very agreeable, the craftsmanship and material being of excellent character. Well-designed costumes for theatrical purposes, quite charming in design and colour, are shown by Miss Norah Waugh, one, a yellow dress with pink and green ribbons, and another of straw colour, powdered with brightly coloured flowers coarsely stitched in wools. Miss Waugh and Miss Thomson also show some successful studies for stage costumes.

Book illustration should be noticed, the drawings for Barnet Fair, by R. O. Wells, and others showing humour and originality. Among the lithographs mention may be made of those by S. M. Bonham Carter and Charles Hulton. The Altar Cross by R. E. Stone, executed entirely by him, is a very remarkable piece of craftsmanship, and should be noticed. Space does not permit of more than passing reference to the modelling, stone carving, wood engraving and other exhibits, but in this last-mentioned section the originally conceived woodcuts by Miss Fiennes repay attention.

When looking at the promising work done by the students of these schools the problem cannot but present itself as to what is to become of it all and of how to create opportunity for it; in what way can the public be brought into nearer touch and be the means of its employment? In the case of carpets, if purchasers obtained them through these young craftsmen doing their work on sound principles, they would get better value for their money, though paying a little more, and the same may be said of the pottery and other work executed at these schools. In buying pottery such as is shown, we are obtaining something of permanent value, and it is much to be desired that the public should, in their own interests, become more alive to the advantage of doing so. The exhibition is open free from June 1st to 30th from 10 a.m. to 8 p.m., Saturdays 10 to 12.

The Aldwych Site Scheme.

We publish this week a proposed scheme of development for the Aldwych site, Strand, prepared by Messrs. Wm. and T. R. Milburn, FF.R.I.B.A., of Sunderland. The elevations are to be erected in stone, and the architectural character will be in keeping with the Bush House property. There are four theatres, theatre A having a seating capacity 2,160; theatre B, 1,342; theatre C, 1,600; and theatre D, 1,110. All these theatres are designed on modern lines, with full stage equipment, dressing-rooms, reception-rooms, refreshment-rooms, cloak-rooms, retiring-rooms, and artistic decorations and furnishings.

The western corner of the west block shows a spacious restaurant with reception hall, cloak-rooms, etc., altogether having a superficial area of 18,000 super feet. Immediately below the restaurant is a cabaret, with stage, cloak-rooms, reception-rooms, dressing-rooms, and kitchen and service accommodation. The superficial area of the cabaret is 12,500 super feet. The plans also show a small arcade, with seven shops or wholesale stores. All space available on the first and upper floors would be allocated to suites of offices, with spacious staircases and lifts. The total area of office space is approximately 25,000 super feet.

It is to be noted in the west block that a portion may be taken up by the option of the India Office, and this area is shown in a dotted line on the plan which would not materially affect the general scheme, except that the restaurant, cabaret and offices would not be available. There would be some slight adjustment to the building line of the theatres. On the east block the east corner would be allocated for the purpose of banking or insurance offices, having a superficial area of 10,250 superficial feet. There is a similar arcade with shops to the opposite side, and the offices above would have a superficial area of approximately 19,000 superficial feet.

Design for Church, Valetta.

This design was prepared by Mr. Philip J. Marvin, but has not been carried out. The material suggested was local stone.

School Chapel, Ramsgate.

This chapel has been erected from the designs of Sir Aston Webb and Son, and was dedicated on Wednesday last by the Archbishop of Canterbury. The gallery stalls were presented by Mr. and Mrs. Siddeley, as a thank-offering for the preservation of their three sons during the war.

Rampton State Institution for Mental Defectives.

The illustration shows the entrance to the Administrative Block, which is about to be erected. The buildings as existing consist of extensive ward blocks for male and female patients, who are entirely separated, with airing courts surrounded by unclimbable walls. A central kitchen, laundry and engineering plant, and also a central recreation hall and bath establishment are provided. There is in addition residential accommodation for the staff; and the administrative offices are at present accommodated in what were intended to be storerooms.

The new buildings are designed with a view to low cost combined with efficiency, and are of the simplest—almost domestic—appearance. Very little stone has been utilised, and what there is will be either Ancaster or a reconstructed stone cast in sand. The brickwork of the Administrative block is to be executed in rough faced bricks of a mottled colouring, thin bricks being used which give five courses to the foot in the finished work. To introduce a little variety into the general brick surfaces the facings have been arranged to run in vertical courses in certain positions where no structural strength is required.

The contract for this building has not yet been actually let.

Mr. J. H. Markham, H.M. Office of Works, is the architect.

Southend Telephone Exchange.

This building, intended to house a main exchange of which there are one or more subsidiary exchanges, is to be installed with automatic plant. As the public will not, generally speaking, have any need to use the building, it is situated not in a main thoroughfare, but on a site served by a private road, and is almost entirely surrounded with low buildings. In view of this, the materials used, and the design adopted, have been of the simplest and most inexpensive nature possible. The plinth is carried out in concrete left with its natural surface as it comes from the metal moulds. The small amount of stone used around the doorways and as a string course is reconstructed stone made by the Croft Granite Company, of Leicester. The facing bricks for the ground story and the band at the top are the Crowborough purple bricks, and the remainder of the walling is faced with stocks. All the brickwork is finished with a joint raked out to a depth of about ½ in.

The window openings are fitted with metal casements supplied by Messrs. Williams and Williams, of Chester. The general contractors are Messrs. F. Hutton and Son, of Birch, Colchester, and the architect Mr. J. H. Markham, H.M. Office of Works.

Church Hall, St. George's Headstone, Harrow.

This design was placed first in the competition held in 1926. The scheme consists on the first floor of a large hall to seat 500, a stage and retiring rooms. On the ground floor is a smaller hall 40 ft. by 26 ft., lavatory accommodation, kitchen and class-rooms. Accommodation for the caretaker is provided on the first floor and above the dressing-rooms. It is proposed to cover the roof with Delabole slates, and the walls will be faced with multi-coloured bricks. The architect is Mr. Cyril A. Farey, A.R.I.B.A., Bedford-square, W.C.1.

House, Shanghai.

This house was designed as the chief official residence for Messrs. John Butterfield, Swire and Co., to be built by their own works department in special earthquake-proof construction—steel and concrete and stone trimmings. The roof is of green tiles, and all the joinery in teak. Mr. Clough William Ellis was the architect.

Nurses' Home, Newark Hospital.

The site of this building was formerly t garden of a semi-detached house, whi latter has been incorporated in the sche as a board-room and porter's house. T home is situated on the London road, the other side of the road to, and direct opposite, the hospital. The shape of t site, together with the aspect, governed t general lines of the plan, which provi twenty-four bedrooms, a nurses' sitting-roo a sisters' sitting-room, and the usual acc sories. Each bedroom has a floor area about 100 square feet and is provided with wash basin, a fixed wardrobe, and a sm heating radiator. Two bedrooms, faci south, and of slightly larger area than t others, are fitted with fireplaces for use case of slight sickness. No kitchen r dining-room is provided, meals being tak in the hospital. The floors throughout of reinforced concrete finished, on t ground floor, with wood block, and on upper floors, with linoleum and cork car laid directly on the concrete.

The home is heated throughout by h water, the boiler, together with that se ing the domestic supply, being located i cellar beneath the outbuildings of the p ter's house, whence a horizontal flue is tak underground to the chimney stack on main building. In both cases circulation by natural means; two cylinders opposite ends of the building are provi for the domestic supply, in order to shor the secondary circulation.

Messrs. G. Brown and Son, of Newa were the builders, and the following w sub-contractors :—Lincoln Brick Compa facing bricks; Mr. R. I. Derry, Newa central heating, hot and cold water, a sanitary plumbing; Harrison and Co., Newark, wiring for electric light; Ho Bros., of Hull, wood block floors. The c of the home has been £6,000, and that adapting the existing semi-detached house the purposes of a board-room and porte house about £430. The plans, by Mr. W. Watkins, F.R.I.B.A., of Lincoln, w awarded the first premium in a limited co petition, of which Mr. Herbert T. Buckla of Birmingham, was the assessor.

United Mission Women's Hospital, Vell South India.

We illustrate this week some drawings the chapel at this institution. Other illus tions and a description of the hospital w given in our issue for December 11, 1 Messrs. Reginald Dann, M.T.P.I., and L nce Angus, M.A., A.R.I.B.A., of Ma and London, are the architects.

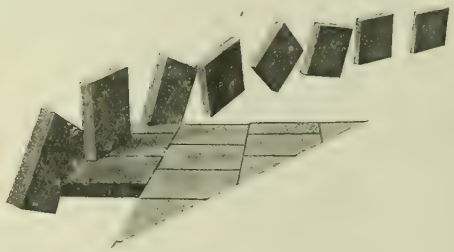
Mr. A. G. R. Mackenzie (Messrs. A. Marshall Mackenzie & Son), Architect.



The "Atlas White" Portland cement rendering on the Parish Hall at Merry Hill, near Wolverhampton, an illustration of which is shown above, is a sound bit of work. The architect for the building, Mr. Geo. Bernard Cox, F.R.I.B.A., of Messrs. Harrison & Cox of Birmingham, specified a plain float granulated surface finish in "Atlas White" stucco, in proportions of one part cement to three parts of a dark yellow silica sand of coarse grain from the Leighton Buzzard district. The resultant concrete is of a warm buff tint, a pleasing colour content being accentuated by bright red Roman roof-tiles. The permanence of true Portland cement stucco wall surfaces, both as regards their colour and texture, make them particularly suitable for this class of building. By writing either to Messrs. Goodman & Co., of Gravelly Hill, Birmingham (sales and service agents for "Atlas White" and "Colemanoid" for the Midland area) or to me in London, anyone interested may obtain for the asking a copy of my "Orthodox Stucco Specifications," which are a useful guide for both architects and contractors.

ILLUSTRATIONS.

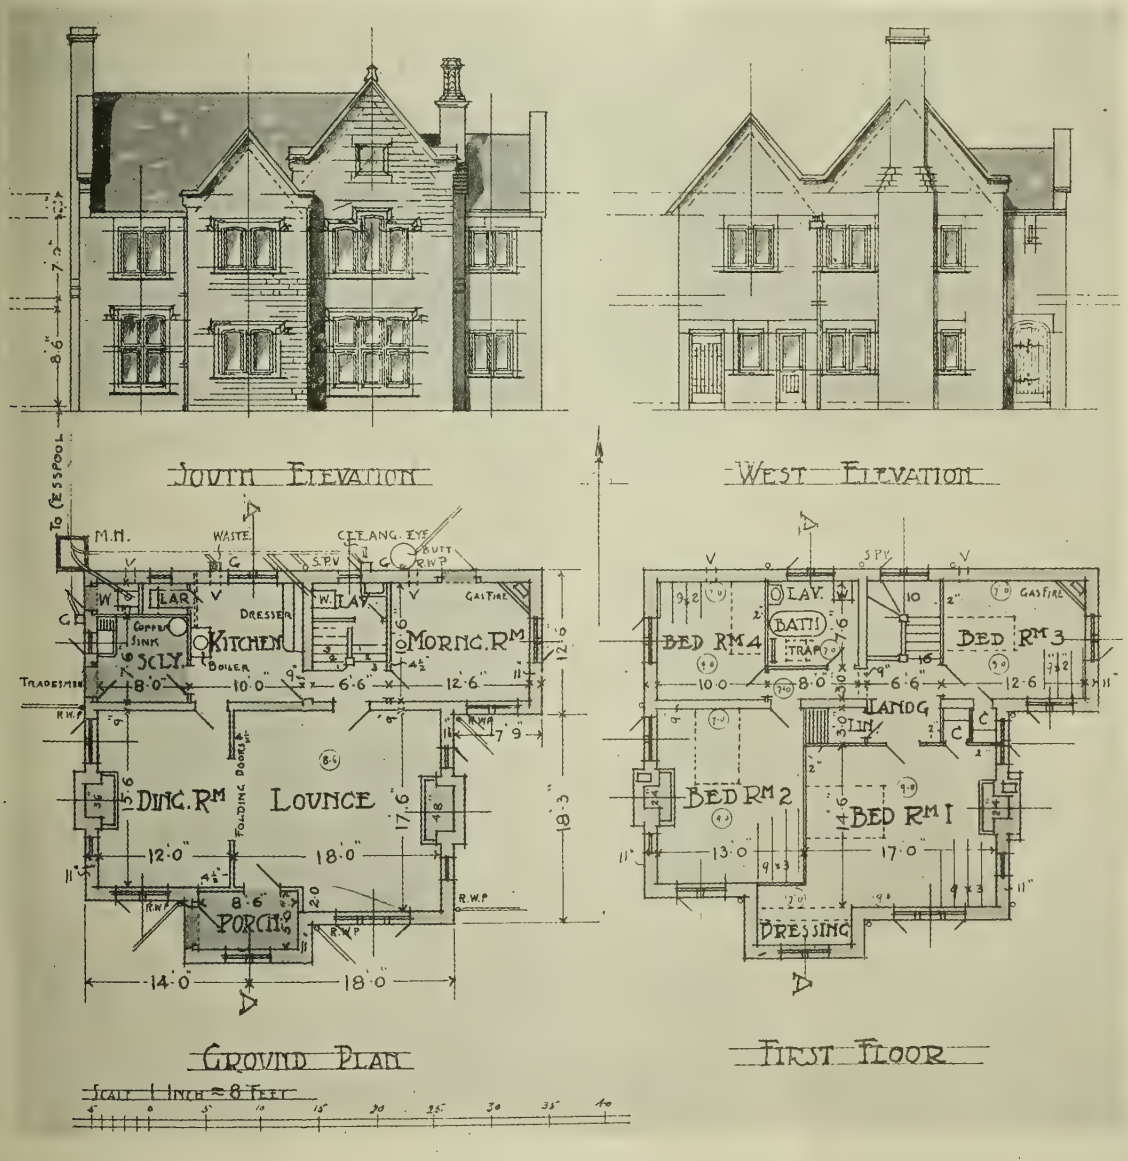
(*Continued from page* 928)

Church of St. Boniface, Tooting.

The Church of St. Boniface, in Mitcham Road, Tooting, was commenced in November, 1906, and is now completed by the addition of the narthex and campanile. It has not been built in any of the recognised styles of architecture; rather it is an endeavour directed towards the production of a new style. At first sight, its internal appearance suggests the early Christian basilicas of Rome, but on examination it will be seen that this resemblance is more apparent than real. There is a wide nave and aisles, and a raised sanctuary, terminated by an apse. A round-arched arcade, supported upon stone columns having very simply carved caps, separates the nave from the aisles. The whole of the walls are plastered, and the aisles are pierced with round-headed windows, while those lighting the clerestory of the nave are segment headed. Around the aisle walls wood panelling is carried to the height of about 7 ft., with a cornice and dentils surmounted by a bold cove with simple lines. The sanctuary is raised five steps above the nave floor level, and enclosed with white marble panelling, with open rail and balusters, and on the Gospel side is a small projecting pulpit. The whole is relieved by a certain amount of gilding, the gold and the white marble blending admirably. Below stand the Communion rails, also of white marble, with gates of beaten bronze, finished in gold, giving access to the sanctuary, and imparting a rich appearance to the whole. The apse is panelled to the height of the springing of the dome with white marble, and the reredos is formed by a colonnade of white marble columns, with sculptured and gilded capitals. The High Altar stands well away from the wall, and a flight of stone steps behind lead up to the throne. The High Altar candlesticks and cross are all of hammered bronze, gilded and designed in harmony with the whole scheme. The sanctuary lamps have also been specially designed. In the marble panelling of the apse two doors of beaten and gilded bronze give access from the sanctuary to the sacristy. At the termination of the aisles are the chapels of Our Lady and St. Joseph, with white marble altars, gilded, with altar crosses and candlesticks of bronze.

Externally the great west front, with its campanile, terminates with a copper-covered spire surmounted by a copper ball and cross. The materials employed are Lawrence's purple facing brick and Portland stone. The great central entrance, with its lofty arch supported on engaged columns with simply carved capitals, is flanked by arcading on either side, with a smaller entrance to the aisle. The great rose window is framed beneath a boldly moulded arch supported by massive columns and capitals. The campanile rises practically bare of ornament till the belfry stage is reached; the belfry openings are ornamented, and the whole stage banded alternately with brick and stone.

The contractors for the present additions were Messrs. Hall, Beddall and Co., and the complete church, which will seat 650 people, has been designed by and built under the supervision of the architects, Messrs. Benedict Williamson and Beart Foss.



We also illustrate the choir stalls and altar rails of S. Ignatius Church, Stamford-hill, designed by the same architects.

Holbrook School Design.

This design was submitted by Mr. A. G. R. Mackenzie in a limited competition held some time ago by the governors of the Royal Hospital School, Greenwich. The parade ground takes the form of an open quadrangle facing the sea, with the school on one side and a gymnasium and swimming bath and chapel on the other. An open saluting base and the library and administration blocks separate this quadrangle from that formed by the dining-room with clock tower and the boys' quarters. The superintendents' and masters' houses are placed facing the sea, and the boiler-house, etc., among trees in the rear.

Design for Small House.

This design, by Mr. W. Herbert Bateman, F.S.I., L.R.I.B.A., is for a small house planned on up-to-date lines.

"Shortwood," Claverton.

Mr. W. Herbert Bateman, F.S.I., L.R.I.B.A., Architect.

THE REGISTRATION BILL IN PARLIAMENT

When the Select Committee, presided over by Sir Clement Kinloch-Cooke, which is examining the Architects' Registration Bill, resumed its sittings on Tuesday, May 31, Mr. W. Forbes Campbell, President of the Association of Architects and Surveyors, continued his evidence.

In accordance with a request made by the Committee at the last sitting, the witness submitted the following memorandum in regard to the qualifications necessary for membership of the Association, together with particulars in regard to method of selection and election of members.

The memorandum stated that the Association was founded and incorporated in September, 1925; the work of organisation of administrative services, etc., occupied several months; and the work rendered necessary by the Architects' Registration Bill had considerably hampered the Association's activities in other directions, more especially in regard to educational matters and examination schemes. However, time had been found to form a committee to advise the Council of the Association on the latter matters and schemes formulated by this committee were nearing completion. Pending the completion of this work, it was deemed necessary to establish a system, whereby membership should be confined to persons whose experience, backed by credentials, provided irrefutable proof of their qualifications to practise in the professions of an architect and/or surveyor. In furtherance of this decision, an Applications Board was set up, and the procedure was as follows :— —

There were two degrees of membership, *i.e.*, Fellows and Associates, which were subdivided so as to cover each of the three main sections of the professions, viz. :—

(*a*) Architects,
(*b*) Surveyors (Land and Building), and
(*c*) Quantity Surveyors;

in addition, there was another grade of membership for "Registered Students."

Qualifications for Membership.—*Fellows.* Applicants must be over the age of thirty and have been in practice or held an official position for a period of at least seven years, and must be otherwise able to satisfy the Council of their qualifications and experience.

Associates.—Applicants must be over the age of twenty-one and have been in practice or held a responsible position with a qualified practitioner for a period of at least four years, and must be able to satisfy the Council of their qualifications and experience.

Registered Students.—Applicants must be over the age of 16, have obtained a standard general education equivalent to the Oxford and Cambridge Local Examinations or other approved examinations, and

(*a*) Be attending a recognised technical institute or school of architecture or surveying.

(*b*) Be an articled pupil or assistant with a bona-fide practitioner, and at the same time be taking a course of instruction in professional subjects.

. . . . . .

The application of the candidate was brought before the Applications Board, who carefully considered same, and the candidate's practical work was examined. The Board, when satisfied with the qualifications and bona-fides of the applicant, proceeded to elect him under the appropriate heading, and he was designated accordingly. Where doubt existed, the applicant was asked for further particulars; if he resided in or near London he was invited to present himself at the next sitting of the Board, or if he lived at a distance, a senior member of the Association in the locality was requested to interview the applicant and to report. Arrangements had also been made whereby an applicant who had been rejected could, on appeal, submit his case to the Executive Committee, and, if necessary, to the Council for a final decision.

The Board which decided applicants' eligibility, or otherwise, for membership, was drawn from a panel of fully qualified men, and at each meeting one or more, usually two, representatives of each of the branches of the allied professions, *i.e.*, an architect, a surveyor and a quantity surveyor (in addition to the chairman) were in attendance. Many members of the older bodies, principally the R.I.B.A., had shown the greatest courtesy in sending testimonials and answering inquiries in regard to applicants in their employ or otherwise known to them, and permitting plans and drawings, executed by applicants, to be sent out of their offices for the Board's inspection.

Sir A. Hopkinson asked the witness for the Association's Memorandum of Association. He desired to know if it contained the names of the subscribers.

The memorandum was produced and handed to the Committee.

Sir A. Hopkinson : Has your Association made any provision for architectural education?—Certainly.

Sir A. Hopkinson : Where?—We are not at the stage yet of stating that.

Sir A. Hopkinson : I want to know where the classes are being held.—We have no regular classes.

And no lectures?—No.

As far as you know, as President, you have no classes and no lectures?—We have no specific classes, but we are making thorough investigation into the state of matters.

Sir A. Hopkinson : I wanted to know how much you knew about architectural education. At present you are doing nothing?

The Witness : I would not say that. I say that we have been investigating it.

Sir A. Hopkinson : What are your qualifications for membership?

The Witness : At the present moment there is an admission fee, and there is varied investigation into every particular applicant.

Do you know what the schools are in which architectural instruction is given at the present time in Scotland and England?—In Glasgow there is, for instance, the Royal Technical School. I do not know a great deal about the leading schools in England

Sir A. Hopkinson : What do you know of the London schools and colleges?

The witness did not reply.

The Chairman : Will you answer the question? Say if you know or if you do not know.

Sir A. Hopkinson : If you do not know it is very simple to say so. Many of us are ignorant about many things. I will not press it. Will you tell us what an architect is?

The Witness : I could not say without a lengthy statement. Primarily, an architect is responsible for the design and construction of a building.

Are you an architect?—No, I am a quantity surveyor.

Will you say that anybody who is responsible for the designs of a building and is responsible for seeing that it is properly erected is an architect?—Provided he has the necessary qualifications.

How do you find those out?—By means of examination, I should say, or tests of a practical nature. As far as my Association is concerned we have endeavoured to investigate what the work done by the various practitioners is.

What about a man who designs and erects a bridge? Is he an architect?—A bridge is not a building.

You would not say that Waterloo Bridge is not a building?—No, a bridge is a civil engineer's job.

Suppose a man erects a cotton mill and designs the exterior of it, and then an engineer puts in the gear and machinery, is he an architect?—In that specific way he is a factory architect.

Suppose an engineer was chosen to go on your register he would be deprived of charging any fees under Clause 12 of the Bill. You have just told us that the designer of a stone building is an architect.

The Witness : In the one case he would be entitled to charge fees as an architect, and in the other as an engineer.

Sir A. Hopkinson : Under the Act he would not be able to charge anything for the building, so really the effect of the Clause would be that an engineer who designs a mill even a mill lodge, and also supplies the machinery, will not be able to charge for the work as regards design and superintending the building?

The Witness : Certainly not as an architect.

Replying to Dr. Watts, the witness said that in regard to examinations, his Council had decided that there was to be no rush in evolving a scheme for education, as they considered it was necessary to investigate the matter.

Dr. Watts : Do you not think the Royal Institute could have done much more in regard to education than your Association?—The Institute has been in existence for a long time, and we have only been in existence for 18 months. We do not want to have a system of cram.

Dr. Watts : Do you not agree that if architects are to be registered that the proper society in this country to have control would be the Institute?—I have already said I consider it wrong for anybody to be the sole governing registration authority.

Do you think your Association should have it?—No, there should be representatives from the various societies.

Dr. Watts : You do not think they are the proper people?—I certainly think they are not.

Sir M. McDonald : There seems to be some little difficulty about the definition of architecture. Do you still say that all building like the type of Waterloo Bridge should be excluded from architecture?—More or less. I consider bridges are the work of a civil engineer. If it comes to the more special decoration the assistance of an architect would be called in.

Would you debar civil engineers who put up bridges and railway stations from recovering their fees?—No, sir.

Would you debar any engineer from recovering fees for anything that would be regarded by other people as architecture?—Not if he were qualified.

You would impose a double qualification on civil engineers? You would make him qualify as a civil engineer and as an architect if he wanted to work his practice in both the spheres, yes.

Mr. Hirst : What particular purpose is being served by the formation of your Association in view of the existence of so old an institution as the R.I.B.A.?—The Witness : Our Association is the first which has members from the different professions; that is to say, we have architects and surveyors. It was considered that by having all the various allied professions together at a common council table we should be able to arrive at firm decisions in connection with the problems of architecture and the allied professions.

Mr. Hirst : I want to find out why your Association was necessary. I am not satisfied yet that reasonable evidence has been given on that point.

Mr. Tasker : Could not you accept the definition of an architect as being a skilled professor in the art of building, whose business it is to prepare plans which simplify the erection of the building?—The Witness : That is quite a fair definition.

Would not that be a fair definition to apply to the engineer?—It is a matter which should be carefully investigated.

Colonel Moore : Are the members of your Council selected because they are known to practise their professions at the moment?—Yes.

There are no further tests?—No.

The Chairman asked the witness to send a printed list of his Association's members. They had asked the same from the R.I.B.A. The Committee would also like to have copies of balance-sheets, copies of any journals published and any other

tions they might have, as well as statistics to the architect membership.

Mr. Tasker: I am afraid we shall be overwhelmed with papers.

The witness said his Association was quite willing to give all possible information to the committee, but they did not want it broadcast.

In reply to other questions, the witness said the Committee were asking for a great deal of information which even the Royal Institute had not given.

Mr. Bignall, Chairman of the Association's Board of Architectural Studies, was then examined.

Sir A. Hopkinson: Have you any relationship with any of the schools of architecture?—Not at the moment, because we are still drawing up our scheme of examinations.

Can you tell us the names of any well-known architects who have joined in framing the scheme?—Mr. Timbrell, City Architect at Newe.

Have you the name of any architect who is known in the architectural profession or in the artistic world?

The witness did not reply to the question.

Sir A. Hopkinson: You would rather not answer that question?—We have in the composition of the Board men connected with education.

Sir A. Hopkinson: I only want to know whether on this Board you have the name of any architect of distinction?—Only the members of this Society.

Does that mean that if they are members of your Association they cannot be distinguished architects?—Not at all. We have tried to meet the case by asking representatives from each section.

The next witness was Mr. Harry John Catley, of the Incorporated Society of Auctioneers and Landed Property Agents. The witness said he agreed with the principle and the necessity of registration in the case of architects, and examined various clauses of the Bill in the light of the Society's views on the Bill. Taking Clause 2, the witness said this clause interpreted the Council as being the Royal Institute of British Architects. If this stood, all the functions of the Council which affected the public and many other architectural societies would be vested in one society. That would not be either just or fair. His Society agreed with the amendments provided by the Incorporated Association of Architects and Surveyors that the Council should be constituted in the manner prescribed in the Third Schedule as set out by them. In the case of Clause 5, his Society considered it should be ensured that no qualified architect practising bona-fide as an architect should be debarred from registration by reason of his being associated with other business or profession allied thereto. Unless Sub-clause 2 is not widened an architect practising in a small town as a general practitioner might be held by the Admission Committee as unfit for registration. They suggested the following new clause:—"Nothing in this Act contained shall authorise the Admission Committee to refuse registration on the ground that an applicant although practising as a bona-fide architect is also associated with other businesses or professions allied thereto, and further, before the Admission Committee decide that a person is not entitled to registration they shall give such person an opportunity of appearing before them and stating his case." His Society felt that any architect member having prior to, not after, the passing of the Act satisfied his society as to his qualifications for joining his society and that he was a bona-fide practising architect should be in itself sufficient to admit him to registration without questions being raised under Sub-clause 2. His Society considered that the Admission Committee should not solely consist of representatives of one architectural body, but should be strengthened and they agreed with the amendment proposed by the Incorporated Association of Architects and Surveyors.

In regard to Clause 10, his Society favoured a less costly means of appeal and power to appear before the Council and then proceeding to the High Court. As to the use of titles, the witness said that an applicant for registration might have an appeal pending against the decision of the Admission Committee, and as the clause stood he might be prevented from practising for a year. This was not reasonable. As to the proviso in favour of local authorities per persons performing acts or operations in connection with the construction of buildings, this seemed to the Society to nullify the objects of the Act, because it allowed local authorities to leave to unqualified men the important work of passing plans for houses and other buildings and improvements, and also to leave unregistered and perhaps unqualified persons to continue to act as architects.

The witness was then asked by members of the committee to define the meaning of architect, but without success.

The Committee then adjourned.

BOOK REVIEWS

Cottages: Their Planning, Design and Materials. By Sir Lawrence Weaver, K.B.E., F.S.A., Hon.A.R.I.B.A. Published by *Country Life*. 15s. nett.

The housing question is always with us. It was urgent in 1913 and during the war years, and still pressing to-day. And this we can say in the face of Sir Kingsley Wood's recent pronouncement, that more houses are now being built than are required to meet the annual growth of the population. There is a considerable leeway of arrears to be made up. A book that shows us what has been done, is doing, and may still be done to solve the problem merits a word of welcome. As Sir Lawrence Weaver says on page 175: "Any policy of rural housing must be based on rigid economy, but a war must be waged against the idea that economy inevitably means ugliness and meanness. Economy and seemliness are inseparable if they are cemented by brains." And so he has "chosen examples of unusual as well as normal character in order to mark the fact that the essence of good architecture is fitness for purpose, and that standardisation will not meet rural needs, however feasible it may be in a mining village." One has but to read his text and look at his illustrations, pictorial and diagrammatical, to see how much thought and sense have been put into the housing question. It would have been so easy to hit upon a standard house—a square brick box with a slate lid—and to have covered the countryside and town suburbs with the necessary hundreds and thousands of such boxes of necessary size. The whole question would have solved itself with one stroke of the official pen; and the remedy would have been but little better than the disease. Gretna, the munition town on the Scottish border, is a case in point. "It is hard enough to find any good thing which came out of the war, but it is at least true that the need for housing vast munition populations in the new areas led in some cases to the planning of towns and suburbs in which the experience laboriously gained at Letchworth, the Hampstead Garden Suburb, Ruislip and elsewhere, was used with admirable effect." The book shows us clearly what was done at Gretna, where a vast township had, perforce, to be created at express speed for the housing of a host of workmen engaged in turning out huge quantities of explosives.

Several chapters on "Cottages" are devoted to the post-war schemes of the L.C.C. at Beacontree, Bellingham, Roehampton and Dulwich, and other housing schemes of other urban district councils up and down the country. In the housing scheme of the Duchy of Cornwall at Kennington, we clearly see town planning or remodelling at its best. It is a supreme effort in the direction of urbanity in urban styles, without any futile attempt at bringing the country into the crowded town. The Adam architectural touches in the Duchy cottages and flats are quite delightful. As the author says: "The old and crowded tenements have given place to the new scheme of streets and quadrangles laid out on spacious lines, but without that striving after high ground-rental values which drives the ordinary builder to extend his crowding upwards by creating blocks of flats of six or seven storeys." The book is profusely illustrated and the illustrations show conclusively how various architectural features and materials in cottage building which, from time immemorial, have fitted into the landscape are necessary and quite practicable even under mass production conditions. From this angle of view, as a compendium, the book is a useful and pleasing addition to architectural records.

An Outline History of Architecture of the British Isles. By P. L. Dickinson. (London: Jonathan Cape.) 15s.

It is stated in the preface that this book is not intended to throw any very new light on the problems that exist in connection with the architectural history of these islands. The author stresses—quite rightly—the social and economic conditions which influence architecture, and condemns the self-conscious and stylistic schools. He is most scrupulous in his dates and definitions of the historical periods and styles, and is not afraid to express his own opinions in the matter. An enormous area is treated in this book, embracing as it does the earliest structures found in this country—Dolmens and Cromlechs—and pre-Christian, Saxon and Roman remains, right through to modern town planning. The approach to architecture is through archæology, but it is none the less interesting on that account. Discussing the present-day position, the author considers—again we think quite rightly—that modern architectural education will have a considerable influence on the work of the future, and that the standard will be a much higher one than that of preceding generations. Altogether, the author has made a praiseworthy attempt to present a coherent architectural history of this country. The book is well illustrated, but the illustrations have no direct reference to the text. A word of praise is due to the publisher for his excellent craftsmanship.

Dramatic Art. By Enid Rose (Royal Academy of Dramatic Art). (University Tutorial Press.) 5s. 6d. net.

The author of this work knows her subject thoroughly and, what is more, presents her knowledge in an attractive form. That is not to say that we can go all the way with her in her dissertation on "The Laws of Expression in Gesture" (Chapter II). Chapter III. on "The Laws of Expression in Speech," is a quite fine exposition of the rules of English prosody. Ruskin did the same very shortly in his "Elements of English Prosody," and we thank this latter-day professor for enlarging upon the subject. A close study of this matter would cure the slipshod methods of speech indulged in by many modern actors. Chapter IV, covering 123 pages, dealing with "The Development of the Theatre and Drama," will appeal to many of our readers who may be concerned in the design and construction of theatres. The drama presupposes a theatre in which it may be presented, and a knowledge of the development of the drama throughout the ages should form part of the mental equipment of the theatre designer, as well as that of the dramatic producer and the dramatic critic. Very little seems to have escaped the writer in her historical researches concerning the evolution of that art which "holds the mirror up to nature," and the book is so packed with information of a fascinating nature that it must prove to be a valuable addition to dramatic literature.

Masonic Peace Memorial.

The London Association of Master Stone Masons have offered the Grand Lodge, through their architects, Messrs. H. V. Ashley and Winton Newman, FF.R.I.B.A., to provide the foundation stone of the Masonic Peace Memorial, masoned ready for the carver. This offer has been accepted, and most members of the above Association are taking part in the working of the stone.

TOWN PLANNING INSTITUTE

"Railways and Town Planning in the Home Counties."

Following on Mr. W. H. Gaunt's paper on "Transport," read before the Institute on May 27 and published in our issue of last week, we give Mr. N. Norman's paper, read at the same meeting.

Mr. Nigel Norman said that at last there were signs that an authority would be set up to control the growth of London, an authority of sufficient wisdom to perceive its necessities, and, he hoped, of sufficient power to obtain their provision. Transport had always been the controlling factor in town planning. Roads came before houses. The economic size of the town depends upon the speed of the transport available. Growth was known to take place in a series of stages; foot transport—village; horse transport—town; rail transport—large city. Now another term must be added to the series, motor and electric-driven transport—metropolis. The growth of the great commercial suburbs, of which they were now becoming somewhat painfully aware, Tottenham and Edmonton might be quoted as typical examples, had been largely attributed to the facilities offered by the introduction of the workmen's cheap fare. This cheap fare had come to mean the provision of transport in the early morning and evenings at a good deal below its economic cost. In other words, railways had been subsidising suburbs. Roads and new roads were essential to the solution of the traffic problem, but, so far, they had not proved so powerful as railways in attracting or dispersing population. In his opinion their importance would diminish rather than increase, as London grew larger, since the factor of speed would enter more and more into the problem. Road vehicles were increasing in number more quickly than road area. Road congestion should mean more rail construction. The present rate of housing development made it clear that in the near future more rail facilities would be absolutely essential. Two means were available to provide more facilities. First, to increase the capacity of existing lines; second, to build new lines. On the Underground and purely suburban railways, the saturation point was being approached at present on many of the inner sections. There was not much scope for increasing their capacity. The most helpful expedient was the reconstruction of certain junctions on what was known as the fly-under principle. In this type of junction one line was carried under the other in such a way that no train had to pass across, or come in contact with the metals of any track other than the one on which it was to run.

Where suburban sections of main-line railways were concerned, there was more scope for an increase of capacity. Of all the railways passing through suburban London, some 60 per cent. were still steam-operated. These lines could be electrified at a fraction of the cost of the construction of new tracks. By this means the capacity of their suburban services would be at least doubled. No new tube railways were being built, because the cost of their construction, which was about 180 per cent. higher than before the war, was never likely to be repaid from traffic receipts. Electrification, on the other hand, was likely to justify its cost, and was, therefore, to be expected before long where it was most needed. At the present time the electric railways of Inner London had been hard hit by omnibus competition. This difficulty was overcome by the Underground Group by the well-known scheme of common ownership of railways and 'buses, by which the receipts of both sources were pooled to meet the total expenditure. At the present level of fares and costs, there was enough money in the London transport business to give a reasonable profit on the turnover. It was stated that this pooling principle would be more widely applied under the new Transport Bill which was now being drafted. No doubt the provisions of the Bill would tend to lessen street congestion by eliminating wasteful competition, while preserving essential transport services. It was doubtful that the system, however it was applied, would produce a fund sufficient to finance any considerable plan of new railway construction. They arrived, therefore, at the following conclusions. Although no steps had yet been taken, immediate rail service requirements could, and probably would, be met by electrification of suburban sections of main-line railways, and by minor reconstruction of junctions and stations on existing electric lines.

Much was said of decentralisation. This he took to mean the proper distribution of the essential organs of the great body which London of the future must be. But it would always be essential to preserve the importance of the centre relative to the whole. He was a believer in the enormous town of the next century. Perhaps, compared to the town of to-day, it would be as the great department store was to the rambling shop in the village. It would be more efficient in production, less wasteful in consumption. The key to its efficiency would be its transport system, and it would have to pay for this efficiency. In those days all transport would have become a public charge. And so, in the meanwhile, some provision would have to be made by the community towards the cost of the railways, as well as the roads, which must be the forerunners of this system. Soon it must become the turn of the suburbs to subsidise the railways. In the future a much-improved network of railways would be required for Greater London, and their value to the community should be sufficient to justify the application of public funds to their provision. Another class of line which would be required for the ideal network was one providing a circular route a considerable distance from the centre of the city. The regional plan would, no doubt, include agricultural belts and civic nuclei, which would naturally fall at the junctions of these lines with radiating railways. The sooner the positions of such lines are established, the easier and the cheaper it would be to provide them when required.

Mr. F. L. Thompson proposed a vote of thanks to the authors, and said the main fact which emerged from the papers was the necessity of decentralisation, but he did not see how the satellite towns were to be established. The problem was to get manufacturers to move to such towns and so assist in solving the difficulty which arose in bringing workers from the dormitory towns to their employment in London.

Mr. W. H. McLean dealt with the question of the development of transport in undeveloped countries. In this country railways were at a disadvantage, owing to the stringency of the regulations, but they were the safest railways in the world.

Mr. Rees Jeffreys touched on the question of the abolition of the Ministry of Transport, and deprecated any attempt to distribute the work of that department amongst several departments.

Mr. Campfield (G.W. Rly. Co.) remarked that the railway companies were always willing to co-operate in town planning schemes, as it was a mutual advantage to the railways and the promoters of schemes. He instanced the case of Ivor, which was being developed and at which already over 300 season-ticket holders resided.

Mr. Willis (Chiswick) thought the reluctance of railways to co-operate in regional planning schemes might be overcome if it was possible to fix the value of land at the time a scheme was brought forward. He also considered that tramways could not be left out of the transport question.

Ald. E. Culpin (L.C.C.) contended that the problem could only be solved by a Greater London Authority, having control over all the traffic services. If railways were to be run in the interests of shareholders, subsidies were impossible, but if they were to be run in the interests of traffic subsidies were necessary.

The vote was passed and the authors replied briefly.

THE BIRTHDAY HONOURS

We take the following names of members of the architectural, surveying and allied engineering professions from the official list of recipients of honours on the occasion of His Majesty the King's 62nd birthday :—

Baronet.

Sir Harry Benedetto Renwick, K.B.E.

Knight.

Mr. Edwin Evans, J.P.

Mr. Richard John Allison, C.B. F.R.I.B.A.

Order of Merit.

The Hon. Sir Charles Algernon Parsons K.C.B., M.A., LL.D., D.Sc., F.R.S.

ROYAL VICTORIAN ORDER. K.C.V.O.

Sir Frank Bernard Dicksee, P.R.A.

ORDER OF THE BRITISH EMPIRE C.B.E. (Military Division).

Engineer Captain Ernest Dickerson Sydenham, R.N.

C.B.E. (Civil Division).

Mr. Harold Thomas Creasy, M.Inst.C.E., A.M.I.Mech.E.

O.B.E. (Civil Division).

Mr. Daniel Meinerts Hahn, M.Inst.C.E., M.I.Mech.E.

Mr. George Norman Croker, M.C.

Mr. Walter Frederick Hedges, A.R.I.B.A.

Lieut.-Col. Albert George Lee, M.I.E.E.

M.B.E. (Civil Division).

Mr. George Ernest Kendall, A.R.I.B.A.

Mr. William George Kershaw, F.S.I., M.R.San.I.

Mr. Robert Barker Crusher.

Mr. Claude Henry Klyne.

D.B.E. (Civil Division).

Miss Emily Penrose, O.B.E., M.A.

K.B.E. (Civil Division).

Lieut.-Col. George William Humphrey, C.B.E., M.Inst.C.E.

IMPERIAL SERVICE ORDER. Companion.

Mr. Charles James Perkins.

ORDER OF THE INDIAN EMPIRE C.I.E.

Mr. John Alfred Baker.

Royal Academy Exhibition, 1927.

"Lola," Stone Bust.

Mr. W. Reid Dick, A.R.A., Sculptor.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XXI

By H. V. MILNES EMERSON, A.R.I.B.A.

ction 74.—Separation of Buildings.

Every building shall be separated r by an external wall or by a party or other proper party structure from djoining building, if any, and from of the adjoining buildings if more one.

In every building exceeding 10 squares ea used in part for purposes of trade anufacture and in part as a private ing-house, the part used for the pur- of trade or manufacture shall be ated from the part used as a dwelling- e by walls and floors constructed of esisting materials, and all passages, ases and other means of approach to art used as a dwelling-house shall be ructed throughout of fire-resisting rials. The part used for purposes of or manufacture shall (if extending to than 250,000 cubic feet) be subject to provisions of this Act relating to the al extent of buildings of the ware- e class.

ovided that there may be constructed he walls of such staircases and pas- such doorways as are necessary for nunicating between the different parts ne building, and there may be formed ny walls of such building openings fitted fire-resisting doors.

In every building exceeding 25 squares rea containing separate sets of cham- or offices or rooms, tenanted or con- cted, or adapted to be tenanted by rent persons, the floors and principal ases shall be of fire-resisting rials.

: this provision shall not entitle the ict surveyor to charge for the inspec- of each set of chambers as a separate ling.

ote.—The party wall in sub-section 1 be either vertical or horizontal, as oper party structure" under section 5 includes party floors, which must be tructed in accordance with section 71 brick, stone or other incombustible erial." It has been held that a house aining two distinct tenements, one on ground floor and one on the first floor, out internal communication, and each ng its own front door, constituted two ses divided horizontally. Ilford Estate *v.* Jacobs (1903), 89 L.T. 295.

ub-section (2). It has been held that a lic-house, with dwelling-rooms used in for the purposes of trade, and in as a dwelling-house, is not a building in this section, as a licensed victualler at liberty to carry on the business ughout the building. Carritt *v.* God- (1899), 80, L.T. 771. In a more recent (Dicksee *v.* Hoskins (1901), 85, L.T. 205), re the magistrate found as a fact that ground floor and basement were in- ded to be used as a beerhouse and the er floors as a dwelling for the licensed epier, the Court of Appeal held that the ing of fact by the magistrate was con- tive, and that the provisions of this ion were held to apply.

ub-section (3) The provision that a dis- t surveyor cannot charge for each set chambers as a separate building is pro- ly due to the case of Moir *v.* Williams 2), 66 L.T. 215, in which it was held t under the Metropolitan Building Act, 5, "a district surveyor could not charge separate building each flat or set of mbers under one roof, and having com- nication only by means of a common rease within the building."

ections 75, 76 and 77.—These sections of London Building Act, 1894, have been aled and substituted by section 16 of L.C.C. (General Powers) Act, 1908, as ows:—

ection 16.—Sections 75 (cubical extent of ldings), 76 (consent to larger dimensions), and 77 (rules as to uniting buildings), of the principal Act, are hereby repealed.

And from and after passing of this Act the principal Act shall be read and have effect as if the following provisions of this part of this Act had been inserted in the principal Act, instead of the said sections 75, 76 and 77.

Note.—The embodying of the following provisions in the principal Act, subject same to the supervision and enforcement of the district surveyor.

Section 17.—Cubical extent of buildings.

(1) Except as in this section, provided no building of the warehouse class and no building or part of a building used for any trade or manufacture, shall extend to more than 250,000 cubic feet, unless divided by division walls in such manner that no division of such building or part of a building (as the case may be,) shall extend to more than 250,000 cubic feet.

And no addition shall be made to any such building, part of a building or division, so that the cubical extent of such building, part of a building or division, shall exceed 250,000 cubic feet.

Note.—In section 5, sub-section 24 of the London Building Act, 1894, the expression "cubic extent" applied to the measurement of a building means the space contained within the external surfaces of its walls and roof and the upper surfaces of the floor of its lowest story.

The expression "division wall" has replaced the term "party wall" used in the repealed sections. The provisions for the construction, etc., of party walls applies to division walls.

In a building divided by a wall, one portion of such building being higher than the adjoining portion, the wall ceases to be a party wall when it ceases to divide the two portions of the building, and need not, from a level of 3 ft. above the lower roof, be constructed in accordance with the requirements for a party wall, *i.e.*, it becomes an external wall with any openings for windows, etc., in same, as desired. Drury v. Army and Navy Auxiliary Co., Ltd. (1896). 74 L.T. 621.

The second paragraph of sub-section 1, counteracts the decision of the Court of Appeal that the corresponding section of the Metropolitan Building Act, 1855, allowed an addition being made to an existing building, so that the cubical contents extended beyond the limit. (Scott v. Legg. 36 L.T. 456.)

(2) Where the Council are satisfied, on the report of the Superintending Architect and of the Chief Officer of the Fire Brigade, that additional cubical extent is necessary for any such building, part of a building or division as aforesaid, and are satisfied that proper arrangements have been or will be made and maintained for lessening, so far as reasonably practicable, danger from fire, the Council may consent to such building or division containing additional cubical extent, but such consent shall continue in force only while such building, part of a building or division is actually used for the purpose of the trade or manufacture, if any, in respect to which the consent was granted.

Note.—Should the premises be used for any other trade, etc., application would have to be made to the Council for their consent to such alteration.

Buildings to which the general provisions of Part VI. of this Act are inapplicable can, under Section 82 of this Act, be erected with the consent of the Council, and such building shall not be of greater cubical extent than 250,000 cubic ft., except in accordance with the foregoing provisions of this Act.

(3) The Council may, in any case in which they think fit to do so, consent to such building or part of a building as aforesaid being divided (wholly or in part) horizontally by floors, to be constructed in such manner and of such materials and in all other respects as the Council may require or approve, and in such case such floors shall, for the purpose of this section, be deemed to be division walls.

(4) The provisions of this section shall not apply to any building which, being at a greater distance than two miles from St. Paul's Cathedral, is used wholly for the manufacture of the machinery and boilers of steam vessels, or for a retort house, or for the manufacture of gas, or for generating electricity, providing such building consist of one floor only and be constructed of brick, stone, iron or other incombustible material throughout, and be not used for any purpose other than such as are specified in this sub-section, and every such building shall, for the purposes of the provisions of the principal Act with respect to special buildings be deemed a building to which the general provisions of Part VI. of the principal Act are inapplicable.

Note.—In sub-section 3 provision is made for the division of buildings, horizontally, with the consent of the Council. Previous to this it had been held that a fireproof floor was not a party wall. Holland and Hannen v. Wallen (1894). 70 L.T. 376.

The following are the requirements of the L.C.C. when making application for additional cubic extent under this section.

A block plan, 22 ft. to an in., showing position of proposed building and buildings adjacent.

Plans and sections to an eighth scale, showing the height of the building in its various parts.

The use to which the various parts of the building are intended to be put is to be indicated, also the positions and numbers of any hydrants or other fire-extinguishing appliances proposed to be provided, and any points bearing upon the question of liability to fire.

REPORT ON STONE PRESERVATION

In December, 1922, the Department of Scientific and Industrial Research set up the Stone Preservation Committee to consider the best methods by which decay, especially in ancient structures, may be prevented or arrested. A report on the progress of the committee's work is now published. The committee found that it was first necessary, for the prosecution of their work, to arrange for a thorough investigation of the various types of decay in relation to the character of the stone and the climatic and industrial local conditions. Broadly speaking, the study has two aspects: (*a*) chemical, physical, and geological, and (*b*) biological. It must be emphasised that owing to the difficult nature of the fundamental researches, speedy results cannot be hoped for. The description in the report of the technique devised for the study of thin sections of friable decayed stone is of special interest.

The contents of the report are as follow:—

Report of the Stone Preservation Committee;

Appendices:

I. Report by Mr. Scott Russell on experimental investigations (May, 1923—June, 1925). Preparation of thin sections of friable materials. Mechanism of weathering. Porosity and its relation to weathering. Structure of the weathered surfaces of various building stones. Portland stone exposed to London atmosphere. Periodic flow of heat in walls. Inspection of weathered buildings. Laboratory experiments on preservatives for test piers. Note on synthetic resins.

II. Précis of oral evidence received by the Committee from representatives of the Society for the Protection of Ancient Monuments, and from Mr. J. E. Marsh, F.R.S.

III. Bibliography.

Copies of the report may be obtained, price 1s. 3d. net (postage extra), of H.M. Stationery Office, or through any bookseller.

THE WEEK IN PARLIAMENT.

WESTMINSTER, *Wednesday.*

Parliament rose for the Whitsuntide Recess on Thursday, June 2, and will reassemble on Monday, June 13.

Roof-Covering Materials.

Sir R. Thomas asked what was the present state of unemployment in the slate industry; and to what extent the use of roof-covering materials imported from abroad was permitted in the building of Government-assisted houses.

Major Barnston said that at April 25, 1927, the latest date for which figures were available, 122 insured persons classified as belonging to the slate quarrying and mining industry, or 1.1 per cent. of the numbers insured, were recorded as unemployed in Great Britain. With regard to the last part of the question, the position was that Section 10 of the Housing (Financial Provisions) Act, 1924, provided that, in approving proposals for the construction of houses, the Minister of Health should not impose any conditions which would prevent the materials required being purchased in the cheapest market at home or abroad. The Government had, however, urged local authorities to arrange that all contracts for or incidental to works carried out by them should, in the absence of special circumstances, be placed in this country.

A Kidderminster Case.

Mr. Wardlaw-Milne asked the Minister of Health whether he would reconsider his decision conveyed in his letter of May 5 to the Town Council of the Borough of Kidderminster, when he declined to declare that Council the authority within their own district under the Housing (Rural Workers) Act, in view of the fact that it was unlikely that there was any property in the borough to which the Act could apply, and that it was undesirable that an administration already dealing with their own housing matters should be joined with a county scheme in reality pertaining to districts outside the borough.

Mr. Chamberlain said he had carefully considered, in consultation with the Worcestershire County Council, the application of the Kidderminster Town Council to be constituted the local authority for the purposes of the Housing (Rural Workers) Act, to the exclusion of the County Council; but he did not consider that any sufficient reason had been shown for granting this application, with the effect of excluding the borough from the cost of the scheme which the County Council had caused to be prepared for the county as a whole.

The Chapel of the Pyx.

Mr. Remer asked the Under-Secretary of State for the Home Department, as representing the First Commissioner of Works, if he was aware that much disappointment was caused to the general public because the Chapel of the Pyx, in Westminster Abbey, was not made available to them; and if, seeing that this chapel was not under the control of the Dean of Westminster, but under the control of the Office of Works, he would give instructions for this chapel to be made available to visitors to the Abbey.

Captain Hacking said that the Pyx Chapel was open to the public on Tuesdays and Saturdays, and the public interest in it was not considered sufficient to justify the cost of opening it every day.

Scottish Subsidies.

Sir J. Gilmour informed Mr. Stephen that the amounts of Exchequer subsidy paid in Glasgow and Scotland respectively under the various Housing Acts since 1918 to March last were £894,463 and £5,654,464.

Houses in Durham.

In reply to Mr. R. Richardson, Mr. Chamberlain gave the following statement:—

A.—HOUSING, TOWN PLANNING, ETC., ACT, 1919.

Statement showing the average prices of houses included in contracts let, and approved estimates for the carrying out of direct labour schemes by local authorities in the County of Durham (including Associated County Boroughs) during the under-mentioned years.

Year.	Houses included in contracts let by local authorities.		Houses included in direct labour schemes of local authorities.	
	Non-parlour.	Parlour.	Non-parlour.	Parlour.
	£	£	£	£
1920..	900	992	841	980
1921..	742	880	709	776
1922..	427	420	434	Nil
1923..	325	400	330	390

The above average prices exclude the cost of land, roads and sewers.

B.—HOUSING ACTS OF 1923 AND 1924.

Statement showing the average prices of houses included in contracts let, and approved estimates for the carrying out of direct labour schemes by local authorities in the County of Durham (including the Associated County Boroughs) during the under-mentioned years.

Year.	Houses included in contracts let by local authorities.		Houses included in direct Labour schemes of local authorities.

1926..	409	451	418	470
1927.. (4 months)	403	459	388	Nil

The above average prices exclude the cost of land, roads and sewers.

School Buildings.

Mr. Cowan asked the President of the Board of Education what were the terms of reference to the committee which was considering the planning of school buildings; and how was it constituted?

Lord Eustace Percy said the terms of reference were as follows:—

"To inquire and report as to the construction of school buildings, with special reference to (i.) the use of new materials and methods of construction; and (ii.) the reduction of cost."

The following were the members of the Committee:—

Sir Frank Baines, C.V.O., C.B.E., F.R.I.B.A., Director of Works, H.M. Office of Works (Chairman);

Mr. G. Topham Forrest, F.R.S.E., F.R.I.B.A., F.G.S., Architect to the London County Council;

Mr. G. E. N. Clay, F.R.I.B.A., Architect to the Board of Education.

With Mr. A. F. Birch-Jones, M.C. (Secretary).

The late Sir Charles Ruthen, Director-General of Housing, Ministry of Health, had also been a member of the Committee.

The Aldwych Site.

Negotiations between Mr. Charles Gulliver and the L.C.C. for the development of the vacant Aldwych site are still held up, says the *Star*, over the question of the amount of ground rent to be paid in respect of the land, or, alternatively, the sum for which it may be purchased freehold. Mr. Gulliver, it appears from correspondence issued by him, offered to carry through his scheme for the erection of four theatres, a restaurant with a cabaret beneath, two arcades, banking, insurance and other office accommodation, at a cost of about £600,000, on the basis of ground rent for the two sites on either side of Bush House, of £25,000 per annum on a 99 years' lease. The Improvements Committee decided that they were not prepared to entertain this proposal at this figure, and pointed out to Mr. Gulliver that they expected to obtain a rent approaching £25,000 for the site on the western side of Bush House, and £20,000 for that on the east side. Mr. Gulliver next suggested buying the freehold of the site for £400,000, but the L.C.C. valuer has informed Mr. Gulliver that from a financial point of view this offer is not so good as if a letting were effected at the rent he proposed.

ARCHITECTS' & BUILDER'S INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Baluster or Banister?

[REPLY TO MR. C. E. H. CLAYTON. MAY 2

SIR,—Baluster is certainly the correct te as used in the trade and profession, English dictionaries give "banister" as corruption of the proper term. I have fo that a more frequent misuse of terms in circles is to refer to the whole of the ba trade of a stair as *the* baluster or banis which is of course entirely incorrect.

PURIST

Definition of Bressummer.

[REPLY TO "ENQUIRER." MAY 27.]

SIR,—A bressummer is a beam spanning opening of considerable size in an exter wall, such as for a shop window or a window. The dividing line between it an ordinary lintol is somewhat arbitrary, I should say that where the window is o 8 ft. span, it would be generally referred as a bressumer. There is no restriction the use of the term as to material or ma mum span, and provided an opening in external wall is covered with a beam, t beam is a bressummer whether in reinfor concrete or steel. It is more usual to it simply a girder, however.

TERMS

Price of House Building.

[REPLY TO "RETURNED EXILE," MAY 27.

SIR,—As an architect, I have found almost impossible to build a reasona decent small house in the home counties under 1s. 3d. per foot cube, and then th is no room for luxuries. Speculative build are no doubt building for a shilling, and e less, but it is hardly a class of building be recommended, and when one hears these low figures, the builder's profit often absorbed in the profits upon the sa

VAIN HOPES

Unstable House and Building Society.

SIR,—A client of mine bought a ho through a Building Society, two years a The front of the house is now falling. (you tell me if the Society is responsible the repairs? The Society's surveyor pas the house before it was bought, and his was paid by my client.

THE BUILDING TRADE

THE LAW OF FIXTURES.—VII.

By W. T. CRESWELL, Barrister-at-Law; L.R.I.B.A.; Associate (late Fellow) of the Surveyors' Institution; &c.

AGRICULTURAL FIXTURES.

Case Law.

o right exists at Common Law to remove ures erected for merely agricultural pur-s, although the custom of the country always had a distinct bearing on the stion of whether they are removable or

ıe "trade fixtures of a farmer," as they ıt be called, are not technically "fixtures" ll. Any relaxation of the old rule that les when fixed remain part of the free-, so often referred to already, has not ın the cases already dealt with where table trade fixtures were concerned) been ıght about by decisions of the Court, but he Legislature. Agricultural fixtures are he present time in England protected as provements" under the Agricultural lings Act, 1923, which Act consolidated ın enactments relating to agricultural ings.

ıe position of the agricultural tenant at mon Law in respect to removal of fixtures enunciated in Elwes *v.* Maw (1802), ıst, 38; where a tenant of an agricultural ing had erected, at his own expense and the mere necessary and convenient occu-on of his farm, a beast-house, carpenter's), fuel-house, cart-house, pump-room and -yard wall, which buildings were of brick mortar and tiled, and let into the ground. was held that he could not remove ın, even though by removal he could leave the premises in the same e as when he entered. Previously this case, in 1694, to be exact, it held that a barn placed on blocks and ens could be removed by the tenant owing a custom of the country. Again in), a tenant was held entitled to take away ch barns. But in 1833 it was held that ınant (not a gardener by trade) could remove a border of box planted by him r he demised premises, and intended to be manent: and that there is no authority saying that an ordinary tenant can take growing trees, unless he has a special -ement for doing so with his landlord.

ı Penton *v.* Robart (1801), 2 East 88, erection of wood, on a brick foundation having a brick chimney, was held to be ovable at the end of the term. In the ıe case, it was said by Lord Kenyon, C.J., "gardeners and nurserymen in the hbourhood of the Metropolis may remove s in the necessary course of their trade; it seems, may remove greenhouses and ouses." So, too, in Mears *v.* Callender 01), 2 Ch. 388, glasshouses erected for the poses of his trade, by a tenant who was aying on the business of a market ılener, and with the knowledge of his ılord were held to be trade fixtures remov-l by the tenant during the tenancy, ugh attached to the freehold.

enerally, market gardeners have, in the ., been entitled to remove greenhouses ı hothouses erected for the purpose of r businesses; also trees and shrubs, such s re likely to become trees, planted with a iv to sale; but not orchard trees.

ı Wansbrough *v.* Maton (1836), 4 Ad. r El., 884, it was held that a tenant is rtled, at the expiration of his term, to e ove a wooden barn which he has erected ı a foundation of brick and stone, the ondation being let into the ground; but h barn resting upon it by its weight alone, it was not fixed to the foundation or the c; but he must not dig up the foundations, h must remain.

Statute Law.

ı certain circumstances then, and subject c statutory requirements, an agricultural tenant may remove fixtures and buildings, before or within a reasonable time after the determination of the tenancy.

The Landlord and Tenant Act, 1851, was the first serious attempt to apply Statutory provisions to the benefit of agricultural tenants. This Act has never been repealed, though the provisions of subsequent Statutes have probably made the Act ineffective. Indeed, it did not go far enough to be of real use. Under Section 3 of the Act, it is provided, that if any tenant of a farm or lands should, with the consent in writing of the landlord, for the time being, erect any farm building, either detached or otherwise, or put up any other building, engine or machinery, either for agricultural purposes or for the purposes of trade and agriculture, and which have not been erected or put up in pursuance of some obligation, such buildings, engines and machinery are the property of the tenant, and removable by him, even though they are fixed to the soil. But the tenant must not remove any of these things, except he first has given his landlord one month's notice of his intention to remove them; and the latter could then purchase them, the value being ascertained by two referees or their umpire.

This last enactment was to some extent superseded by section 53 of the Agricultural Holdings Act, 1875, which enacted, that a tenant fixing to his holding any engine, machinery, or other fixture for which, under the Act, he is not entitled to compensation, and which is not so affixed in pursuance of some obligation in that behalf, or instead by some fixture belonging to the landlord, then such fixture shall be the property of, and removable by, the tenant. Before removal, the tenant must pay all rent owing and satisfy all other obligations in respect of the holding. In removal, he must not do any avoidable damage, and must make good damage after removal. No fixture can be removed without a month's previous notice in writing to the landlord, who may, in writing, elect to purchase. The value, in case of a difference, to be settled by a reference under the Act. The section does not apply to a steam-engine erected by the tenant, if before erection he has not given the landlord notice in writing of his intention to erect: or if the landlord, by notice in writing, has objected to the erection. The above section was repealed as from January 1st, 1884, by the Agricultural Holdings Act of 1883, but the rights of removal, etc., in respect of fixtures, affixed to a holding between February 14th 1876, and January 1st, 1884, to which the Act of 1876 applied, are still determined under the above section 53.

Several other successive Acts have been passed; the principal of these being that of 1908, which, however, has, in its turn, been repealed and re-enacted by the consolidating Act of 1923. Under Section 22 of the Agricultural Holdings Act, 1923, "any engine, machinery, fencing or other fixture affixed to a holding by a tenant; and any building erected by him thereon for which he is not, under the Act or otherwise, entitled to compensation, and which is not so affixed or erected in pursuance of some obligation in that behalf or instead of some fixture or building belonging to the landlord, shall be the property of, and be removable by, the tenant before, or within, a reasonable time after termination of the tenancy." This applies to all holdings, however small, but before removal the tenant must comply with four conditions: (1) He must pay all rent owing, and satisfy all other obligations to the landlord in respect to the holding; (2) In removal, no avoidable damage must be done; (3) All damage done by the removal must be made good by the tenant; and (4) No fixture or building is to be removed without a month's previous notice in writing to the landlord, who may, in writing, elect to purchase at a fair valuation (to be settled, if there is a difference, by arbitration). The section does not apply to any fixture or building affixed, or erected before January 1st, 1884. The provisions of this section apply equally to a fixture or building *acquired* since the 31st day of December, 1900, by a tenant, in like manner as this applies to any fixture or building *affixed or erected* by a tenant.

Provided the conditions of the section are kept, and the landlord does not elect to purchase the fixtures, then they become the property of the tenant, who can claim a "reasonable time" in which to remove them. What is a "reasonable time" is a question of fact, and depends on the respective merits of individual cases.

By Section 48 of the Act of 1923, the provisions, so far as they relate to the tenant's property in fixtures or buildings, extend to those affixed or erected by a tenant to or upon his holding, or acquired by him since December 31st, 1900, for the purposes of his trade or business. The tenant can remove all fruit trees and fruit bushes planted by him and not permanently set out; but he must remove them before the termination of the tenancy, or he cannot claim compensation, and they remain the property of the landlord.

Market Gardens and Allotments.

Under the Act, the term "Market garden" signifies a holding cultivated, wholly or mainly, for the purpose of the trade or business of market gardening. An allotment garden or land cultivated as a garden are not included in the category, unless they are cultivated wholly or partly for the purposes of trade or business of market gardening. Nor does it include ground let to a tenant during his continuance in any office, appointment or employment held under the landlord.

Under Section 47 of the Small Holdings and Allotments Act, 1908, the tenant of any small holding or allotment may, before his tenancy expires, remove any fruit and other trees and bushes planted or acquired by him, and for which he has no Statutory claim to compensation. Also, he may remove any tool-house, shed, greenhouse, fowl-house or pigsty built or acquired by him, for which he has no Statutory claim for compensation.

Notice of Removal.

An agricultural tenant who at the expiration of his tenancy omits to give his landlord (under the provisions of Section 21 of the Agricultural Holdings Act, 1908) notice of his intention to remove any fixture or building, by which omission the landlord is prevented from exercising the option given to him by that Act to purchase the same, cannot afterwards claim compensation for expenses or loss suffered through the removal.

In *re* Harvey and Mann's Arbitration (1920) 89 L.J.K.B. 687, Harvey, the landlord of a farm, gave Mann, the tenant, a notice to quit in September, 1918; whereupon Mann gave notice (under the combined operation of Section 1 of the Agricultural Holdings Act, 1914, and Section 11 of the Agricultural Holdings Act, 1908) only of his intention to *claim compensation* for the loss or expense directly attributable to the quitting of the farm, removing fixtures, goods, etc., but no notice was given to the landlord by the tenant that he intended to remove these fixtures as required by Section 21 (1) of the Act of 1908. The matter was referred to arbitration, and the arbitrator made an award in the form of a special case; in which, *inter alia*, he awarded the tenant compensation for the expense of removing and refixing a certain agricultural engine and machinery

which the tenant held to be fixtures, and for depreciation of the same due to the removal. On appeal, it was held that no notice having been given to the landlord by the tenant that he intended to *remove* these fixtures, as above referred to, and the landlord, by reason of this omission having had no opportunity to exercise his option of purchase under the Act of 1908, no compensation could be given to the tenant in respect to damage or depreciation. Lord Sterndale, M.R., said that the right of the tenant to make the claim was given by Statute. But the Statute had expressly provided that he was to give notice to the landlord of *intention to remove* any fixtures, and had not done so, and had thereby deprived the landlord of his right of pre-emption. He was asking for compensation in respect of an unlawful removal, and it could not be granted.

Contracting Out of the Acts.

It would appear that it is open to the parties to an agricultural lease to themselves contract out of the operations of the Acts in respect to the removal of buildings and fixtures.

In Premier Dairies, Ltd., *v.* Garlick (1920) Ch. 17, a lease of a farm contained a covenant by the lessee to deliver up at the end of the term all the demised premises and all new and other buildings and erections thereon, and all such fixtures as were in any wise affixed or fastened to the freehold of the premises. It was held that the covenant effectually excluded the provisions of Section 21 of the Act of 1908, and that the tenant was disentitled to remove certain buildings and fixtures erected and affixed by him during that term.

RENT RESTRICTION.

"IN THE PUBLIC INTEREST."

Very few cases have come before the Courts under Section 4 Subsection (1) (*e*) of the Rent Act, 1923, which makes one of the grounds upon which recovery of possession can be claimed "that the dwelling house is reasonably required for the execution of the statutory duties or powers of a local authority, or statutory undertaking, or for any purpose which in the opinion of the Court is in the public interest . . .," and the Court is satisfied in either case that alternative accommodation is available as prescribed in paragraph (*d*); therefore some interest attaches to the case Gooch *v.* Stratman reported in the *Times* of May 5 last.

The plaintiff who owned some 57,000 square feet of land at Stepney, on which were certain wool warehouses and two cottages, required one of the cottages so that a scheme as regards the warehouses and the approaches thereto might be completed, and evidence was given that since 1925 there was a scarcity of wool warehouses in the City and it would be advantageous to the wool trade as a whole that the plaintiff's warehouse accommodation should be so extended. The County Court judge had held that the plaintiff did not require the cottage for "a purpose in the public interest," but merely for his own business, and that the extension of any trade, however useful to the public, was not a matter of public interest within the meaning of the subsection. The Divisional Court dissented from this latter general statement but held that it did not invalidate the finding of fact by the judge that in this particular case the premises were only required for a private purpose apart from the public interest.

Mr. Justice Talbot, whilst agreeing with Mr. Justice Acton in the judgment as above expressed, is, however, reported as having said that it was the uniform practice of Parliament not to grant compulsory powers to purchase land to any person carrying on business however important it was apart from undertakings authorised by Parliament and subject to Parliamentary restriction, and a County Court judge might well apply some such general rule of practice as that in exercising his discretion under the subsection, although he was not entitled to make a rigid rule and apply it to all cases. If the learned judge is correctly reported may we respectfully say that this dictum seems open to objection on two grounds:—In the first place, an application by an owner under the Rent Acts is not an application to acquire compulsory powers of purchase, but merely an application to recover possession of his own property from a tenant who occupies a privileged position owing to temporary restriction imposed by statute, and secondly the legislature in dealing with this application has expressly distinguished between statutory duties and powers and "other purposes," but deals with both as is shown by the words "in either case." Mr. Justice Talbot's dictum might lead to the latter words of the subsection dealing with "other purposes" being construed *ejusdem generis* with the first part of the subsection dealing with statutory powers, but the words "in either case," we submit, show that was not the intention.

This paragraph first appeared in the Rent Act, 1920, Section 5, Subsection (1) (*e*), but was then differently worded as follows: "The landlord is a local authority or a statutory undertaking and the dwelling house is reasonably required for the purpose of the execution of the statutory duties or powers of the authority or undertaking. . . . ." It will be seen the introduction of the words "or for any purpose which in the opinion of the Court is in the public interest" in the Act of 1923 followed by the words "and the Court in either case is satisfied as aforesaid as respects alternative accommodation" is an extension of the original section which appears to show that the words "for any purpose" are not to be read as *ejusdem generis* with the statutory duties or powers of a local authority or statutory undertaking.

We only venture to make this point because in other cases it may be material, but we need hardly say the dictum of Mr. Justice Talbot had no effect upon the decision of the Court delivered on the facts of this case, to which he agreed. The widening of the paragraph in 1923 must, however, have been introduced to make the restrictive provisions of the Act less stringent, but even in 1923 it was only contemplated that the principal Act of 1920 should be extended to June 24, 1925 (see Rent Act, 1923, Section (1)). This period has now been exceeded by nearly two years, and yet the Rent Acts are retained, and such cases as the above appear to show the unsuitability of retaining some, at any rate, of the restrictions contained in Acts which had their origin in the conditions prevailing in a time of war.

The building in question is described as a cottage, and presumably it is quite a small dwelling house. The urgent needs of the present day are the furthering, not of war, but of peaceful industrial enterprise, and that surely is "a purpose in the public interest"; but as the above case shows, Rent Restriction stands in the way and the interests of a small tenant may prevent an alteration in business premises which the owners, at any rate, consider of paramount importance to the carrying on of their business. Business premises were removed from the Acts years ago, but as the above case shows, they are still embraced indirectly by the tentacles of Rent Restriction.

Scottish National War Memorial.

The Prince of Wales, president of the Scottish National War Memorial Committee, will perform the opening ceremony on July 14th. Later in the day the King and Queen, who will be in residence at Holyrood, will visit the memorial and will be received by the Prince.

Mr. James Cadenhead's Estate.

James Cadenhead, R.S.A., R.S.W., of 15, Inverleith-terrace, Edinburgh, left £6,356.

THE LANDLORD AND TENANT (No. 2) BILL—II.

In our last article we considered the provisions contained in Part I. of the Landlord and Tenant (No. 2) Bill, which relate to compensation for improvements and for goodwill. But Part II. of the Bill contains some "General Amendments of the law of Landlord and Tenant, which require careful consideration.

Damages for Breach of Repairing Covenant.

The first clause in this Part of the Bill (clause 13) provides in sub-clause (1) "Damages for a breach of a covenant or agreement to keep premises in repair during the currency of a lease, or to leave premises in repair at the termination of a lease, whether such covenant or agreement is expressed or implied, and whether general or specific, shall in no case exceed the amount (if any) by which the value of the reversion (whether immediate or not) in the premises is diminished."

Sub-clause (2) provides that "any dispute arising during or at the termination of a lease as to the amount of damages payable in respect of any breach of any such covenant or agreement may, at the instance of either party, be referred to the tribunal, whilst sub-clause (3) makes the whole clause retrospective. Broadly speaking, the law at present is that when an action is brought during the currency of a tenancy for breach of covenant "to keep the premises in repair," the measure of damages is not the sum required to put the premises in repair, but the loss to the landlord measured by the depreciation in the saleable value of the reversion. This has been decided in a number of cases, but will be found clearly stated in the Text Books (See for instance Redman's Law of Landlord and Tenant, eighth edition, at page 315), but qualified by the statement that all the circumstances of the case must be regarded. This was approved by the House of Lords in Conquest v. Ebbetts (1896 A.C. 490), and the House of Lords in that case indicated that in assessing the damages such considerations as the changed circumstances of the neighbourhood were not to be taken into consideration.

Where, however, the action is brought after the termination of the tenancy the law at present is that the damages are such a sum as will put the premises into the repair contemplated by the covenant, and the only circumstance which can prevent the application of that rule must be something in the condition of the premises which affects the relation between the lessor and lessee; for instance, contracts between the lessor and a third party must be disregarded. (See per Lord Esher in Joyner v. Weeks (1891 2 Q.B. 31.).)

It may here be noticed that in that case Lord Justice Fry made the following observations: "The rule so laid down" (that is that the damages recovered are usually such as are sufficient to put the premises in repair and as a matter of fact, it is never proved in evidence to what extent the reversion is damaged) "is one of great practical convenience. It is more simple than the inquiry to what extent the reversion is damaged which appears to me to involve many matters in respect to which the lessor has nothing to say to the lessee. It is much more simple than the rule suggested by the judgment of the Court below, viz., that the measure of damages is the amount of the diminution in value of the reversion not exceeding the cost of the repairs. That involves the ascertainment of two amounts in order to take the smaller of the two. However exact such a measure of damages may be there is, as it seems to me, a complexity about it which unfits it for determining affairs between man and man in a court of law."

We set out this passage because it has an exact bearing upon what the clause proposes to effect, and which introduces the principle condemned by a Lord Justice of great experience. It is true that the clause takes the matter out of the jurisdiction of

the Courts if either of the parties to the dispute so require and takes it to a special tribunal and thus deals with one ground of the Lord Justices' objections, but it leaves many other points in doubt.

What effect will the clause have on such cases as Anstruther Gough Calthorpe v. McOscar (1924 1 K.B. 716; THE BUILDER, July 25, 1924), in which case it was contended that the fact that the neighbourhood had depreciated as a residential district ought to decrease the measure of damages for a breach of a covenant to leave the premises in repair? The clause, put shortly, provides that for a breach of covenant of this nature the damages shall in no case exceed the amount by which the value of the reversion is diminished, this apparently meaning by the lack of repair, and it applies to the two cases a breach of covenant to keep in repair and to leave in repair. In McOscar's case, the Court took the time of demise as the date at which the standard of repair had to be regarded, following Morgan v. Hardy (17 Q.B.D. 770; 18 Q.B.D. 646). Under this clause at what date will the value of the reversion be regarded? On this will depend what the damages to the reversion consist of and whether the effect of another cause, such as deterioration in the neighbourhood is taken into consideration. Then, if the landlord has to prove the diminution in the value of the reversion, will this be the absolute damage to the reversion from the lack of repair or will he have to prove he, as landlord, has suffered damage, that is to say, can the claim be met, as was attempted in Joyner v. Weeks, by showing the premises have been let at the end of the term on the same or more favourable terms, the lessor having been put to no expense in making good the lack of repair? Hitherto, as we have shown under the decided cases, only circumstances having a direct bearing on the actual relationship of landlord and tenant have been regarded.

Before this Bill was introduced it was stated on behalf of the Government by the Attorney-General, that it was intended to meet the case where damages are exacted for putting premises into repair, although the landlord intends to pull them down after the termination of the lease, no doubt with reference to the case Rawlings v. Morgan (18 C.B.N.S. 776), but how will this clause affect such a case? Is the tribunal, in considering whether the lack of repair has diminished the value of the reversion, to consider prospective action on the part of the landlord in regard to his property after the termination of the lease and entirely unconnected with the tenancy?

We have only endeavoured to point out a few of the questions involved in connection with this clause. The law of landlord and tenant is largely unwritten law, depending upon decisions of the Courts delivered over some hundreds of years, but it is now fairly understood; any alteration in the law has to be read in conjunction with those decisions and the principles they apply, and an ill-thought-out clause may only result in confusion, especially if it comes to be interpreted in cases where the parties so desire by a special tribunal which, however, will give decisions concurrently with the Courts, for unless the parties remove a case it will remain under the jurisdiction of the Courts. Thus two tribunals may be interpreting this clause at the same time and in different ways, and appeals on questions of law may be numerous. We refer to this question later on, when considering the "Tribunal."

Provisions as to Other Covenants.

Clause 14, sub-clause (1) provides that in all leases made after the commencement of this Bill as an Act containing a covenant condition or agreement against assigning, under-letting, charging or parting with the possession of demised premises or any part thereof without licence or consent, such covenant (unless made in pursuance or in consequence of a covenant, condition or agreement contained in a lease made before the commencement of this Act) shall notwithstanding any express condition to the contrary, be deemed to be subject to a proviso to the effect that such licence or consent is not to be unreasonably withheld.

This sub-clause seems wholly reasonable. The word lease, as used here, is defined in clause 19, unless the context otherwise requires to mean a lease, under-lease, assignment operating as a lease or under-lease, or an agreement for such lease, under-lease or assignment. We have already drawn attention to the fact that this clause (19) also contains a definition of the word "tenant" which, unless the context otherwise requires, means "any person entitled in actual possession to the holding under any contract of tenancy for a year or for any longer period, whether the interest of such tenant was acquired by original contract, assignment, operation of law or otherwise." In Part I. of the Bill the context of the clauses appears to exclude tenancies for or by the year, and in Part II. of the Bill the use of the word "lease" seems to exclude mere tenancy agreements, and it is rather difficult to ascertain to which clauses of the Bill this wider interpretation of the word "tenant" will apply.

Sub-clause (2) of clause 14 provides that in all leases, whether made before or after the commencement of this Act, containing a covenant condition or agreement against the making of improvements without licence or consent, such covenant condition or agreement shall be deemed, notwithstanding any provision to the contrary, to be subject to a proviso that such licence or consent is not to be unreasonably withheld, but this proviso does not preclude the right to require as a condition of such licence or consent the payment of a reasonable sum in respect of any damage to, or diminution in, the value of the premises or any neighbouring premises belonging to the landlord, and any difference as to the reasonableness of any such sum shall be referred to the tribunal.

Sub-clause (3), which refers to all leases whether made before or after the passing of the Bill, containing a covenant, etc., against the alteration of the user of demised premises without licence or consent, provides that such covenant, etc., shall, if the alteration does not involve any structural alteration of the premises be deemed, notwithstanding any express provision to the contrary, to be subject to a proviso that no fine or sum of money in the nature of a fine, whether by way of increased rent or otherwise, shall be payable for or in respect of such licence or consent; but this proviso does not preclude the right of a landlord to require payment of a reasonable sum in respect of any damage to or diminution in the value of the premises or any neighbouring premises belonging to him and of any legal or other expenses incurred in connection with such licence or consent. The sub-section further provides "Any difference as to the reasonableness of any such sum shall be referred to the tribunal and in the event of such reference the landlord shall be bound to grant the licence or consent on such terms as the tribunal considers reasonable." We may pass over the other clauses in the Bill and now confine our observations to clause 16 in Part III., which relates to the tribunal to which reference has been made in the previous clauses.

The Tribunal.

There is to be a Reference Committee consisting of the Lord Chief Justice of England, the Master of the Rolls, and the President of the Surveyors' Institution. This Reference Committee will appoint a panel of referees and the "Tribunal" will be such one of these referees as may be selected in manner to be provided by rules made by the Reference Committee. Sub-clause (2) gives the Reference Committee power to make rules and sub-clause (3) provides that the decision of the tribunal on any question of fact shall be final and binding on the parties and the persons claiming under them respectively, but any party may appeal to the High Court on any question of law, and the decision of the High Court shall be final and conclusive and shall not be subject to appeal to any other Court. But by sub-clause (7) nothing in the Bill is to prevent an agreement being made for referring to arbitration under the Arbitration Act, 1889, any matter which under this Bill is to be determined by the tribunal.

We have referred to the disadvantages of creating special tribunals which will deal with matters concurrently with the Courts, and it will be seen that under the Bill either party may elect to go before the tribunal, but otherwise the matter will be heard by the Courts as at present. The result appears curious, for if the High Court deals with the matter an appeal will lie to the appellate Courts right up to the House of Lords, and cases between landlord and tenant are of such complication they have frequently been carried to the highest tribunal. If, however, either of the parties elect to go before the tribunal, then no question of law can be carried higher than the High Court, and that under the Bill appears to mean a single judge of the High Court and not even a Divisional Court.

Sub-clause (4) deals with costs in a somewhat unusual manner, the tribunal has not only discretion as to costs and by whom and in what manner they shall be paid, but the clause further provides "and the tribunal may in any case disallow any costs which the tribunal considers to have been unnecessarily or unreasonably incurred and the tribunal may itself tax the amount of the costs ordered to be paid, or may direct in what manner they shall be taxed.

By sub-clause (5) any order of the tribunal may by leave of the High Court or a judge thereof be enforced in the same manner as a judgment or order of the Court, and after such leave has been given may be registered under the Land Charges Act, 1925, as an order affecting land.

We have attempted to give a brief summary of the complicated provisions of this Bill and to indicate some of the points which may be raised in connection with them. The law of landlord and tenant is something like the British Constitution unwritten and flexible, depending largely upon decisions given by the Courts as cases have arisen. This Bill to a certain extent attempts to codify the law on certain points and, moreover, creates a special tribunal and this appears a somewhat new departure. There is certain to be litigation connected with it in the first instance, as modern Acts of Parliament attempt to be too meticulous and enter into too great detail, and this in itself occasions litigation in order that the intention of Parliament may be ascertained, and it may be a question whether the objects desired could not have been secured by a quite short measure of but few clauses.

A second question which arises in connection with the Bill is whether it is desirable to set up special tribunals which are to deal with limited branches of law related to one larger subject. Where is such a policy to end? The Courts have dealt with all subjects and attained the highest reputation in the whole world and are resorted to when possible even to decide disputes arising outside the Kingdom, they are also now expeditious and their decisions are fully reported and published. A number of special tribunals will only make for confusion, and unless the tendency to create them is checked we may at last come to the cry, "One man, one Court."

New Theatre : Southampton.

A sliding roof and a roof garden are features of a theatre which Moss' Empires, Ltd., are proposing to erect in Commercial-road, Southampton, to hold 2,500 people. Plans, prepared by Messrs. W. & T. R. Milburn, FF.R.I.B.A., of Sunderland, will shortly be submitted to the Southampton Corporation for approval. The theatre will occupy an island site, and there will be a private parking ground for motors. It is proposed to instal every modern device, including lifts and bathrooms for artists.

NEW BUILDINGS IN LONDON

Bermondsey.—PREMISES.—Messrs. Courage and Co., Ltd., have just made a successful application to the Bermondsey Borough Council for the erection of new premises at 11-17, Boss-street, S.E.

Bloomsbury.—BUILDINGS.—The President of the Board of Education, Lord Eustace Percy announced at the annual Graduate dinner of the University of London that negotiations were almost completed for the purchase by the University, for University purposes, of the Bloomsbury site.

Burlington-gardens. — RECONSTRUCTION. — Messrs. White, Druce and Brown, estate agents, have purchased Nos. 3 to 5, Burlington-gardens, W.1. The estate agents, after reconstructing the building will open there a dozen shops on the ground floor, the upper floors being devoted to showrooms and offices. The site consists of the front portion of an island site bounded by Clifford-street, Old Burlington-street, Burlington-gardens, and Cork-street.

Camberwell.—DWELLINGS.—On a site in Comber-grove, Camberwell, the London County Council are to erect a block of dwellings. Plans have been prepared by the Chief Architect to the Council, and tenders are now being invited.

Edgware-road.—CINEMA.—Mr. Charles H. Abrahams, of Holloway, is carrying out the demolition work at the corner of Edgware-road and Marble Arch, for the erection of the new "Regal" cinema, for Mr. A. E. Abrahams. Mr. Clifford Aish, of 22, Bedford-street, W.C.2, is the architect, and the building work is by Messrs. F. G. Minter, of Putney. The cinema is to cost about £250,000.

Lambeth.—SHOPS.—Messrs. Andrews and Peascod, architects, of 135, Bow-road, E.3, have submitted plans to the Lambeth Borough Council for the erection of a covered arcade with two-storey shops between Electric-lane and Coldharbour-lane.

Lambeth-walk.—PREMISES.—The Lambeth Borough Council has approved the plans submitted by Mr. J. M. Sheppard, F.R.I.B.A., 38, Bedford-place, W.C.1, for the erection of a building at 93-97, Lambeth-walk.

Leicester-square.—THEATRE.—A scheme is afoot for the construction of a theatre on the south side of Leicester-square, W.C.2. It is understood that Colonel Harry Day, M.P., who is connected with the scheme, is negotiating for the site.

Mile-end.—SCHOOL.—A new school is to be erected in Cephas-street, Mile-end, for the London County Council.

Mitcham.—CHAPEL.—Tenders are being invited by the Mitcham Urban District Council for the construction of a chapel and caretaker's house, together with the laying out of a new burial ground on a site near to Tooting Junction Station. Messrs. Chart, Son and Reading, of Union Bank-chambers, Croydon, are the architects.

Poplar. — RECONSTRUCTION. — Structural alterations are being carried out by Messrs. T. Stevens, Ltd., of South Molton-street, W.1, to the Wades Arms P.H., Jeremiah-street, E. Messrs. Young and Co., 6, Queen Anne's-gate, S.W., are responsible for the constructional steelwork.

Regent-street.—REBUILDING.—In support of a £250,000 rebuilding scheme which is being undertaken by the Polytechnic, Regent-street, an appeal has been made to the motor industries for £15,000 for a new School of Motor Engineering and the development of the Motor Body Building School.

Victoria-road. — FLATS. — The Kensington Borough Council has approved plans by Messrs. Baillie Scott and Beresford, architects, 8, Gray's Inn-square, W.C.1, for the erection of a block of flats at Kensington Palace Mansions, Victoria-road, W. The building contract has been secured by Messrs. Ward and Paterson, 75, Victoria-street, S.W.1.

PATENTS.

APPLICATIONS PUBLISHED.*

250,527.—E. Milkutat: Construction of concert halls.
250,599.—J. W. Fuller: Cement.
252,210.—O. Lindemann: Mortars and cements.
252,659.—Compagnie Nationale des Radiateurs: Kitchen range.
252,740.—Waygood-Otis, Ltd.: Lifts.
256,262.—K. Kumpmann, W. Kumpmann, E. Rahmede and A. Rahmede: Wood-screw-cutting machines.
256,577.—S. Barnes: Sash-holder.
258,293.—T. Fusoni: Concrete mixer.
256,630.—H. Junkers: Gas stoves.
259,617.—J. W. Rijns: Pipe-joint.
262,000.—J. S. Williams: Window and other hinged structures.
263,266.—W. Eutin: Windows.
263,293.—Keith & Blackman Co., Ltd., and W. J. B. Davidson: Boiler stoves.
263,364.—S. Macomber: Beams.
263,365.—S. Sacerdote: Cooking-stoves.
263,380.—V. H. Askam: Chimney-tops.
263,384.—A. E. G. Bergkvist: Plug for a sink pipe.
263,397.—C. Graafe and H. Mikoray: Cocks.
263,426.—V. J. M. Eras: Door locks.
263,442.—F. F. Hardwick: Flexible ladders.
263,509.—Moir-Buchanan Centrifugal Processes, Ltd. and C. M. Ure.: Pipes.
263,513.—D. J. Thomas and J. Thomas: Water-supply systems.
263,528.—W. Pattinson: Doors.
263,571.—J. A. Rice: Cements.
263,572.—D. Palmer-Jones and Scaffolding (Great Britain), Ltd.: Scaffolding.
263,677.—G. P. Reintjes: Wall construction.
263,925.—A. J. Auspitzer: Improving the quality of wood.
263,929.—J. D. Hunt: Ladders.
263,936.—C. A. Jones: Sawing wood.
263,941.—A. Bear and J. Stevens: Skylights.
263,997.—J. Saxild and C. F. A. Ingerslev: Construction of quay walls and piers.
263,998.—J. R. Preston: Drying cupboards.
264,004.—Benham & Sons, Ltd., and C. R. Allensby: Heating installations for buildings.
264,022.—S. A. McMinn: Anti-corrosive paint.
264,027.—R. R. MacFadden: Instruments for testing the deflection and oscillation of bridges.
247,976.—J. A. H. Itier: Cement.
264,040.—W. Newman & Sons, Ltd., and H. G. Newman: Window-operating mechanism.
264,067.—Metropolitan Carriage Wagon & Finance Co., Ltd., and G. H. Bailey: Windows.
264,071.—M. Mederer: Sanatoria.
264,088.—C. Arnold: Pipe connections.
264,095.—Victaulic Co., Ltd., and P. G. Johnson: Pipe joints.
264,200.—J. C. Carnegie: Hot-water systems.
264,208.—H. J. Goss: Machine for making boxes.
264,210.—W. G. Thomlinson: Machines for forming boxes.
264,254.—I. Gardner: Concrete structures.
264,269.—W. H. Potter: Spliceless lifting and pulling rope with armourings.
264,293.—H. R. Rignold: Brackets.
264,294.—Humber, Ltd., J. A. Cole, and C. S. Oliver: Door hinges.
264,298.—H. J. Craymer and H. P. Simpson: Ball castors.
264,336.—W. J. Tibbett: Sanitary closet.
264,356.—G. W. Guy and R. E. Jarl: Fireplaces.
264,364.—S. H. Trew and F. G. Gardiner: Flushing cisterns.
264,368.—H. Hope & Sons, Ltd., and J. T. Willis: Hinges.
264,373.—S. N. Jones: Catches for doors.
264,436.—W. H. Bolt and F. Shuttleworth: Casement windows.

* All these applications are now in the stage in which opposition to the grant of patents upon them may be made.

TRADE NEWS

Ruud Water-heating and Storage Syste

The new British factory of the Ru Manufacturing Company, Ltd., at Slou was opened on Monday, May 2. The Ruud stantaneous automatic gas water-heater the Ruud automatic storage systems h for many years been widely used and preciated in the United States and Canada. For a third of a century Ruud Company has concentrated its wh attention upon this object, and the Slou factory embodies all the fruits of its perience in America. The instantaneous water-heater is appropriate for use private houses, institutions, blocks of fl hospitals, hotels, industrial buildings, elsewhere. Providing at any moment the day or night an unlimited supply hot water, it gives this service in a m economical manner, and with absol security for personal safety and for apparatus itself. The main gas burn which practically "flashes" cold water the degree of heat required, is only in ope tion whilst the water tap is turned on. efficient thermostat is provided in order guarantee that under all conditions water supply shall control the gas heat system. The Ruud storage system provi a bulk supply of hot water. It both he water and stores it at the temperature quired until it is drawn off by the ta Through the positive mechanical action the all-metal thermostatic moment-valve tank is replenished with hot water imm ately after each withdrawal. The lower of temperature caused by the entry of c water after hot water is drawn off p into action the gas heater, which contin to operate until a full supply of water heated and automatically passed to storage tank. With regard to insulation thoroughly does the granulated cork ins tion of the Ruud tank do its work t after the tank is filled with hot water fuel, it is claimed, will be required periods ranging from 10 to 16 hours.

In the Ruud multi-coil heating and st age system there is a combination of advantages of the Ruud instantaneous water-heater and of the Ruud stor system. The multi-coil models provide the needs of buildings where very la quantities of hot water are frequently quired. Each of the Ruud appliances water heating and storage is supplied sizes to suit all requirements. Manufact of the Ruud appliances in this country by a British staff and from Brit materials.

Messrs. the Ruud Manufacturing Co., L are holding, we learn, a display of th ranges of Ruud instantaneous water-heat and storage appliance, at their premises 99, High Holborn, W.C. The compa invite a visit for inspection and testing their appliances.

Stanchions and Steel Columns.

We acknowledge with thanks the receip a calendar from Messrs. Banister, Wal and Co., Ltd., the constructional engine and stock holders of steel work, of Traff Park, Manchester.

Memorial to Pilgrim Fathers.

The Mayflower Hall, which has been erec at Billericay, Essex, as a memorial to Pilgrim Fathers who more than three c turies ago left with their womenfolk America in the "Mayflower," has b opened, and a memorial tablet has been veiled to the memory of the four people Billericay who took part in that histor voyage. Those four people—Christopher Marie Martin, Soloman Prower, and J Langerman—formerly lived in the old Char House, which still stands in Billericay H street.

(For rates of wages in the Building Trade in Scotland, see page 955.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

Manchester Municipal College of Technology.

We have received a copy of the prospectus of short courses of lectures and laboratory work to be given during the summer at the Manchester Municipal College of Technology. Instruction is given in the following subjects: Mechanical Engineering, Electrical Engineering, Municipal and Sanitary Engineering, Building, Chemistry and Chemical Technology, Textile Industries, Printing and Photographic Technology, Mathematics, Physics and Natural Philosophy, Mining, Industrial Administration.

The head of the building department is Mr. F. E. Drury, M.Sc.Tech., M.I.Struct.E. The summer evening classes will begin on Monday and Tuesday, June 13 and 14, and (save when a different number of meetings is specified) will continue until Tuesday, July 26. Intending students should present themselves for enrolment half an hour before the first meeting of the classes they wish to attend.

Ferro-Concrete Buildings, Panama.

The British Vice-Consul at Panama (Mr. C. S. Humber, M.B.E.) reports that the construction of a large number of ferro-concrete buildings is contemplated in that city, and he accordingly suggests that British firms interested in the supply of materials used in this class of construction should forward catalogues, prices, etc., of their products for transmission to the leading local contractors. Four copies of catalogues, etc., he states, could be advantageously placed, and these should be addressed direct to His Britannic Majesty's Consul-General, British Consulate-General, Panama City. The Vice-Consul has also furnished some particulars regarding the following schemes which are about to be undertaken in Panama, and which may possibly provide openings for the supply of British materials, etc.

(1) The construction of a bath house at Panama City, by a firm of local contractors, at an estimated cost of 16,000 dollars.

(2) The erection of a first-class modern hotel to cater for tourist traffic. The building is to be of reinforced concrete, and will cost not less than 50,000 dollars.

Firms in a position to offer materials of British manufacture can obtain further particulars of these projects on application to the Department of Overseas Trade, 35, Old Queen-street, London, S.W.1.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Aberdeen.—BUILDING.—The Plans Committee of the Town Council have passed plans for 951 dwellings in the city, estimated to cost £372,539. The plans included those for 935 dwellings to be erected under the Town Council's housing scheme at Cattofield, Hilton, and Seaforth-road.

Dundee.—BUILDINGS.—Plans and sections of proposed new buildings, etc., have been lodged at the office of the City Engineer:—Alpin-road and Strathmore-avenue—Shops for the Eastern Co-op. Society, Ltd.; architect: Mr. G. Jamieson, 20, Whitehall-street. Graham-street—pavilion for M.S.W. Welfare Club. William-street—offices and workshop for Messrs. John Raitt & Co.

Dundee.—FACTORY.—The establishing of a new linoleum factory in Dundee has reached another stage. The piece of ground, extending to a little over 16 acres, situated on the Dudhope estate on the south side of Clepington-road, has been purchased by Mr. R. Lindsay Robertson, solicitor, on behalf of the Company.

Edinburgh.—HOUSES.—The Dean of Guild Court has granted a warrant for the erection of 570 houses at Prestonfield. The Court also sanctioned the erection of dog kennels at Logie Green football ground; and Messrs. James Steel's Trustees, for the conversion of four houses at 20-23, South Learmouth-gardens, into six flatted houses.

Edinburgh.—BUILDING PLANS.—At a sitting of Edinburgh Dean of Guild Court, warrant was given to Alexander Robb to build an aerated water factory at Hutchison-road. Another warrant granted by the Court was to James Woodhouse & Son, for alterations and additions to premises at 60, Princes-street, which are to be converted into a furniture warehouse. Other warrants granted were:—James Banks, three bungalows and garages at Milton-road East; James Duff, four shops, six houses, and six garages at corner of Saughtonhall-drive and Avenue; Mrs. Elizabeth Gunn, bungalow and garage at corner of Queensferry-road and Corbiehill-road, Davidson's Mains; Mrs. Ann Thain, four shops and two houses at St. John's-road, Corstorphine; Topping & Co., two flatted villas and two garages at Campbell-avenue.

Falkirk.—At a sitting of Falkirk Dean of Guild Court, plans were submitted and warrant sought for the erection of the first portion of the new Falkirk and District Infirmary. The complete scheme in connection with the new Infirmary, which is to be built on ground acquired at Gartcows, Falkirk, is estimated to cost £100,000. The Court unanimously agreed to grant the warrant.

Glasgow.—CINEMA.—The Dean of Guild Court has passed plans for Botanic Gardens Picture House (Ltd) to erect a picture house at corner of Byres-road and Observatory-road, Hillhead; and Messrs. G. H. M'Dougall & Sons, 165, Dumbarton-road, Partick, to erect a public-house and shops in Dumbarton-road at New Bridge-street, Partick.

Troon.—BUILDINGS.—The Lodge Troon Navigation, No. 86, has obtained sanction to proceed with a building scheme comprising shops, hall, and temple. The buildings are to be erected on a site on the north side of Portland-street. The total cost of the buildings will be £4,012. Mr. J. R. Johnstone is the architect.

The Jumna River Bridge.

Messrs. P. and W. Maclellan (Ltd.), Clutha Works, Glasgow, have been successful in securing the contract for a new bridge over the Jumna River at Allahabad for the Indian State Railways. This is to replace the old bridge, now unsuitable for modern heavy traffic, and consists of 14 spans of 215 ft. each (about 6,000 tons).

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

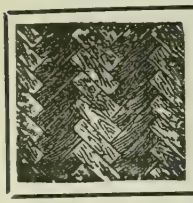
Incorporated Church Building Society.

At a recent meeting of this Society, held at 7, Queen Anne's-gate, Westminster, the Rev. A. G. Ingram in the chair, grants were made towards building a new church at Claremont, The Holy Angels, £500.

Towards enlarging or repairing the churches at: Brixton, St. John the Evangelist, £100; Gabalfa, St. Mark, £100; Hadleigh, St Mary, £50; Haydock, St. James-the-Great, £30; Mutford, St. Andrew, £50; Stanwick, St St. Lawrence, £15.



From the Mission Buildings Fund grants were made to the following churches:—Heeley, St. Leonard, £60; Markham, St. John, £150.

The following grants were also paid for works completed:—Ashill, St. Mary, £30; Brisley, St. Bartholomew, £25; Ewhurst, St. James, £30; Fawkham, St. Mary-the-Virgin, £30; Gillingham, St. Luke, £150; Hartlepool, St. Barnabas, £15; Kinoulton, St. Luke, £40; Letterston, St. Giles, £50; Swanton Morley, All Saints, £75; Woodside, St. Luke, £200.

In addition to the above, the sum of £648 was paid from Trust Funds towards repairs to 30 other churches.

The monthly meeting was followed by the Annual General Court, at which the following gentlemen were elected to fill vacancies on the Committee:—The Rev. B. F. Simpso Lord Balniel, Mr. Harold Clayton, C.I.I Viscount Cranborne, Sir Herbert Ellisc Lord Weston, the Hon. Hugh Wyndham.

Mr. Arthur Hervey Hoare, was re-elect as Hon. Treasurer.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXXII. No. 4402. JUNE 17, 1927.

"QUIS CUSTODIET . . . ?"

RECENT correspondence on the subject of the care of cathedrals raises a question which has many facets. This particular situation is not unique, but rather typical of many similar ones. The responsible authorities of the moment decide that it is desirable demolish, rebuild, or add to a particular building under eir care, be it abbey or village church, cathedral, college, arket-house or monument. The subject is presumably faced om many points of view before a final and definite decision is ached, although it is reasonable to expect that the viewint most in evidence is that of the body directly concerned. hen the decision is made public, it may or may not stir blic imagination to approbation or disgust. At so eleentary and tentative a stage is the public consciousness of any nd of proprietorship in the externals of street buildings, so determinate is the position with regard to acknowledged asterpieces of the building art, that it is natural and necessary at from time to time various bodies should come into being guide, instruct and express public opinion on such matters. protest or plea for caution from some such body is an almost evitable countermove to an announced decision such as that the Dean and Chapter of Norwich to build a new Lady apel on the old foundations. The protest is, of course, limited the aspect with which the particular society is concerned, this case the Society for the Protection of Ancient Buildings. hether the protest in this instance was necessary or superous is perhaps beside the point. The important fact remains at by such means the attention of at least a section of the blic has been drawn to a projected action affecting architctural matters, and the question of national interest in the ivate property of corporations or individuals is again raised. ldom in any art, save architecture, would comparable action contemplated, and so no protest would be initiated. No e would expect to add figures to a Vandyck group with punity, nor decapitate a statue, whether in private or blic custody.

Apart from questions of proprietorship and the rights of terference, there are also the apparently conflicting claims antiquity, beauty, historical association, functional nvenience, suitability and "amenity." Of the various cieties and associations whose important task it is to educate blic opinion, some mount their watch-tower in order to conntrate their gaze upon one form of beauty in art or nature, me upon another; one association may seek to combat the jects of modern progress upon the ancient landmarks, while other bases its activities on the faith that properly directed ogress is not incompatible with beauty. In an age like the esent there is room for many such organisations. Although erlapping may occur, it is better than a policy of *laissez-faire*. e antiquary, the archæologist, the ethnologist, the historian, e not necessarily concerned with the preservation of beauty. e lover of trees is not necessarily a connoisseur of a carver's aftsmanship. The faculty for designing a modern building charm and distinction is not indispensable to a just appreciation of an ancient barn. The old and the beautiful are not ways synonymous. A definition of "antiquity" equally ceptable to all archæologists would be hard to find. Who shall t limits to the range covered by the expression "historical terest?" Is the site of a Roman camp to be covered by it, hile the "old gun park" occupied by Territorials in 1914 is cluded? Is the disused windmill to come under the term, d the ruined chimney of the steam bakery, now operated by electricity, to be disregarded? History itself is an ever-unwinding continuity; what then can be excluded from the category of "historical monuments," and who shall claim guardianship of the guards?

Amid these apparently conflicting facets of a prismatic problem, it seems that one condition alone can effect a fusion of the interests involved. It is not necessarily desirable that a few archæologists should study modern economics; that a few engineers should seek to master the mysteries of the thatcher's craft, or that parochial church councillors should attend courses of instruction in ecclesiastical ornament. In the ranks of the clergy there are many of the most scholarly archæologists; many of the laity are men of admirable taste; architects are increasingly conversant with many branches of art and science outside the actual borders of their professional knowledge, and many are competent to advise on matters ecclesiastical. But the fact remains that no really satisfactory solving of the problems of progress and preservation, of beauty and convenience, can take place until the public conscience in such matters awakes to its responsibilities—not necessarily responsibilities of action, but at least of thought and of discussion. No Act of Parliament, preservation or guidance can be really effective for good until the nation as a whole realises something of the implications of its heritage. Its responsibilities range from "litter," to Westminster Abbey. Education in such matters is the only path to follow.

In the matter of church buildings there are very many aspects to consider when the case for or against extensive restoration or addition is in question. It must be borne in mind that, with few exceptions, our finest cathedrals and village churches are themselves varied chronicles of past progress and change. Many are palimpsests in stone. The very changes they record make them all the more historically interesting, if sometimes less complete in their beauty as originally conceived. At times beauty has been demolished to make way for beauty; the newer beauty being regarded as superior to the old, and therefore the more worthy of purposes of worship. In our own days so generally unanimous is the acknowledgment of the superiority of ancient beauty, with its depth of expression impossible in our days of more superficial emotions, that it is unthinkable that a corporation or an individual would contemplate the destruction of, say, a fourteenth-century nave, in good preservation, to make way for a modern version, however excellent in design and execution. To add a new page of historical record to the old, provided that the new page be in some indisputable way as true a record as the old, may, on occasion, be a perfectly legitimate step. Virtue may lie in novelty of expression, or it may be that the appearance of the new must conform "more or less" to that of the old, in becoming deference. The very fact of the manner of the new echoing the old may prove the existence of the modern spirit of intelligent care.

Whether or not all monuments of national value come sooner or later under national supervision is immaterial, if the national conscience, awakened and stimulated by the activities and guidance of specialist societies, eventually develops a habit of almost automatic reaction against precipitate and ill-judged undertakings. Public opinion might then itself become the guardian and referee in matters of architectural taste—the "national authority" exercising supervisory powers.

NOTES

The R.I.B.A. Conference.

The arrangements for the London Conference of the R.I.B.A. have now been completed, and from what we hear they should give general satisfaction. A varied programme has been provided and with good weather the meeting should be a memorable one. One of the great advantages of such conferences is the opportunity of meeting friends and acquaintances, and the arrangements appear to have been made with this object specially in view. Among the outstanding social events of the week will be the ball, to be given at the R.I.B.A. Galleries, 9, Conduit-street, W. For this the Architectural Association have devised and executed a scheme of decoration calculated to be in keeping with the spirit of cheeriness and festivity always present at such a function. Those architects and their friends who wish to dance, or see those who do, are advised to make application without delay to the Secretary at the Institute.

The Albert Medal of the Royal Society of Arts.

The Albert Medal of the Royal Society of Arts, which was founded in 1863 as a memorial to Prince Albert, for eighteen years President of the Society, and is awarded each year "for distinguished merit in promoting Arts, Manufactures and Commerce," has for the current year been awarded by the Council, with the approval of the President, H.R.H. the Duke of Connaught, to Sir Aston Webb, G.C.V.O., C.B., P.R.A., P.R.I.B.A., F.S.A., LL.D., "for distinguished services to Architecture." Amongst Sir Aston Webb's works, which are well known to our readers, may be mentioned the new façade to Buckingham Palace and the architectural surroundings of the National Memorial to Queen Victoria; the Admiralty Arch, Charing Cross; the completion of the Victoria and Albert Museum; the Britannia Royal Naval College, Dartmouth; the Royal College of Science, Dublin; the Imperial College of Science and Technology, South Kensington, and many other public and private buildings.

Design and Material.

Two well-known members of the profession have this week brought to the notice of the public, through the medium of the *Times*, the growing menace of haphazard and unlovely buildings which are springing up like mushrooms amongst some of the pleasant places of the land. Yet any able architect could give advice, both as to the placing and general design of small buildings which would go far to prevent the deterioration of our suburbs and countryside. Mr. Caröe rightly calls attention to the value of proper materials in building, and we could wish that this protest which he and Mr. Dawber have just uttered could find some sort of practical echo in the actions of our governing bodies.

Cottage Architecture.

Mr. Guy Dawber, in his letter, has once again urged that steps should be taken to prevent the injury that is daily being committed by the erection of unsightly and ill-designed cottages and bungalows. Possibly one of the most astonishing features of nineteenth-century life will, to posterity, appear to lie in the tolerance of the squalid monotony of the town house, followed by the futile frippery of the suburb. That the evil was recognised is obvious from the saying "God made the country, Man made the town, the Devil made the suburb." It is extraordinary that, until well on into this century, no seriously-reasoned protests were made against this abuse of freedom. It was accepted as though it were inevitable, and now that more progressive minds are everywhere alive to the evil, the habit is found to be too firmly rooted among our acceptances to be easily exorcised.

Government Architects.

Controversy is busy with the conundrum as to whether or no an architect who is a full-time employee of the Government can have sufficient spare time to undertake the architectural work of a contract for £1,000,000. Questions of this kind depend so much upon their interpretation that it seems hopeless to look for a definite or final answer. If an architect were expected himself to design every detail for a million-pound building, his time would at the least be fully occupied. If, on the other hand, the money were expended on an engineering scheme where a litt guidance on general lines was all th was expected, we can imagine that very small time might suffice. Agai if an architect were consulted in a pure advisory capacity, the drawings a supervision being carried out elsewhe such advice might well be given in man's spare time. The question not as simple as it looks.

Public Apathy.

It is fully recognised by t profession that the gre bar against better and mo beautiful building is t apathy and ignorance of t general public. Ignorance might cured, but can we get rid of apath We believe that sound building and go design pay in the end, but still t public are unconvinced. It is only qu recently that the large output of sm houses, mostly of bad design and che construction, has brought home to ma of us the menace they threaten to t general amenity of suburbs and count places. In two recent journeys we ha seen instances in which valuable buildi sites for good houses have been ruin by the intrusion of bungalows of a po sort. The worst of this is that it wou almost certainly have been possible to place these small buildings that th would not interfere with the gene amenity, and if some sort of enlighten control or even advice had been availa the benefits accruing to both the smal and the larger properties might have be secured. The remedy for the unfortuna state of affairs which exists seems to lie an energetic and intelligent action

Charterhouse School War Memorial Chapel.

Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Architect. (*See page* 966)

A Type of Cottage which Demands Preservation.

part of local authorities. So this ngs us up against political influences. ocal authorities are composed of those o obtain their position by the influence party politics there is little hope of aining seats on our councils for those o can bring a collectivity of view into ir deliberations, who will refuse to be ded by class interests, who will con- er the general amenities of life and sibly think of beauty as an element of ne value to us all.

ontrol of Design.

While we endorse entirely the views as to the state of things which Mr. Guy Dawber deplores, and agree ially as to the desirability of employing mpetent architects as much as possible all building work, yet to impose a tem of control over the designs for v houses is another and more difficult tter. That nation is probably greatest ere the laws sit lightly on the people— is perhaps the sign of it, and it is ibtful whether the circumscribing of ivity by too much legislative or other itrol is at all a healthy condition. r trust in machinery has not justified lf so infallibly that we should seek add to it at the present moment. ough we deeply regret the indifference the people to the beauty of their own intry, which should be so precious an eritance to all of us, we are inclined to r more on the growth of more civic ponsibility and public spirit, than to ts of Parliaments, and Mr. Dawber's n effort should not fail to contribute to it end.

he L.C.C. d the District Surveyors' Examination.

According to one of our correspondents, a rumour is afloat that some members of the London County Council have been criticising versely the Examination for District rveyors as conducted by the Royal stitute of British Architects, and are ging the Council to provide, in the bjected new London Building Act, removing the Examination from the ntrol of the Institute and vesting it in e Council. It is said to have been ted that the Examination, as at esent constituted, is not "up to date" d that it has been conducted in a hole-in-the-corner" manner. Before iously contemplating such a change authority, the results of the existing system surely deserve careful consideration. From what is known of those now holding office as District Surveyors, can it be argued that in their case the Examination has not produced satisfactory results? Is there any ground of complaint as regards the manner in which they discharge their duties? Architects, from their experience, are in a position to form some decisive opinion upon those points, and it were well if some considerable body of them would address representations on the matter to the London County Council, to assist that body in judging whether the suggested change would redound to the benefit of the general public.

The House Builder.

The pressure of public opinion is daily increasing, and the means of escape from ugliness in the architecture of everyday life is open for all to see. Well-designed cottages and bungalows exist by the score. It is to the National Federation of House Builders that one naturally turns to ask whether that body is doing all in its power to cater for a better taste and a creditable countryside, or whether it is satisfied to act as drag by pandering to a bad habit that in any case cannot long survive. It may be too much to expect the Federation to insist that all its members include some knowledge of architecture and design among their other qualifications, but the public may well expect the Federation to include some work in this direction among its other activities. So far, judging by the annual meetings, nothing of the kind appears to have been done. The prestige of the Federation urgently calls for action. We hope that it will put into practice the words of one of its best known ex-Presidents: "We are all idealists in varying degrees, and builders will welcome every attempt to raise the public taste for something better in housing than that which they have been contented with in the past."

The Old Cottage Problem.

The Royal Society of Arts has effectively emphasised the appeal on behalf of our old cottages by the Prime Minister by issuing it in a pamphlet form with typical illustrations and an interesting note on the building methods of the old cottages by Mr. Thomas Hardy. This little pamphlet should penetrate the length and breadth of the land. Apart from the more notable examples there are many small cottages in the country, like that we herewith illustrate, which can only be restored by the owners when some help is forthcoming to effect their proper preservation. It is obvious that help should be given to those who are really unable to do themselves what is necessary. We trust that by this appeal the Prime Minister will secure a warm response from all who value our national and architectural traditions, so bound up in these records of the past. It should not, however, be supposed that the destruction of so many of these "priceless gems of English craftsmanship," to quote Mr. Baldwin's words, is to be credited only to the uneducated. We have but to think of a lovely village in the Cotswolds containing numbers of ancient cottages and other buildings either left to decay, or repaired in such a manner as to mutilate and deface them. We must express our regret that the appeal did not include a mention also of old farm outbuildings, of which so many are becoming ruinous, and which, for their architectural and historical interest, are of equal importance to preserve.

Cottage at Craven Arms, Salop (now demolished).

From "Old Cottages, Farmhouses and Other Half-timber Buildings in Shropshire, Herefordshire and Cheshire," by Parkinson & Ould.)

GENERAL NEWS

Menin Gate Memorial.

The Memorial Arch at the Menin Gate (Sir Reginald Blomfield, R.A., architect) will be opened by Field-Marshal Lord Plumer on Sunday, July 24, at 10.30 a.m.

New Naval Museum.

Britain's first complete naval and nautical museum is to be opened to the public within the next few weeks. The museum will be placed in the famous Queen's House at Greenwich, built by Inigo Jones for James I.

The New Chapel : Stowe School.

The Queen, on Monday, visited Stowe School, Buckinghamshire, and laid the foundation stone of the new Chapel, which is to be erected to the designs of Sir Robert Lorimer.

Edinburgh University.

Plans of the building which is to be the new home of the Zoology Department of Edinburgh University have been passed by the Edinburgh Dean of Guild Court. The building, with its fitments, is expected to cost about £79,000. The architects are Messrs. Lorimer & Matthew.

University of Burma.

A gift of £100,000 has been offered by the directors of the Burmah Oil Co. to the authorities governing the proposed new university in Burma. Sir John T. Cargill made the announcement of the gift at the annual meeting of the company in Glasgow. The money, he said, was for the establishment of a college of mining and engineering.

Architects' Benevolent Society.

From the annual report—the 77th—of this Society, it is clear that invaluable work has again been rendered during the last year. Eighty-five applicants have been assisted with grants during the year, and fourteen beneficiaries have received pensions. The Society have nominated Sir Edwin Lutyens, R.A., as the third Trustee, in place of Sir Aston Webb, G.C.V.O., C.B., R.A., retired.

British Architects' Conference.

We have received a revised copy of the programme of the R.I.B.A. Conference, which is to be held in London from June 20 to 25. We note that the following proposed visits have now been cancelled : D., British Museum and Foundling Hospital; K., Drive round Central London ; L., Visit to South Kensington ; P., Drive to Hatfield, Welwyn and St. Albans. The original programme was given in our issue for May 27.

Garden Cities and Town Planning Association.

A tour to the North of England and Scotland, dating from September 16 to 23, has been arranged by this Association. The cities to be visited are Newcastle, Edinburgh, Glasgow and Carlisle. The full programme, with particulars of costs, etc., will be sent upon application to the Secretary, Garden Cities and Town Planning Association, 3, Gray's Inn-place, London, W.C.1.

Architects' Estates.

Mr. Frederic Rowntree, F.R.I.B.A., of 11, Hammersmith-terrace, London, W., formerly of Scarborough, of Glasgow, and of 11, Little College-street, Westminster, S.W. (net personalty £2,537), left £4,076.

Major Arthur Stirling Pridmore (late Queen's Westminsters), Harpenden, Herts, late of Messrs. John S. Lee & Sons, architects and surveyors, left £5,866.

Mr. George Halford Fellowes Prynne, Ealing, left £5,145.

Foord Almshouses at Rochester.

On June 28, Prince and Princess Arthur of Connaught will open the Foord Almshouses at Rochester (Mr. E. Guy Dawber, A.R.A., P.R.I.B.A., architect). These almshouses (illustrated in *The Builder* of May 13), now nearing completion, have been built in memory of the founder, the late Thomas Hellyar Foord, a citizen of Rochester, who died in 1917. He bequeathed a sum of money for their building and endowment, and this formed a fitting climax to his generous benefactions to his native city.

Engineers' Estates.

Mr. Lancelot Hugh Corbett Palmer, East Hanningfield, Essex, civil engineer, late Great Indian Peninsula Railway, left £7,668.

Mr. John Nash Lawrence, of 56, Wellington-road, Oxton, Birkenhead, Cheshire, retired civil engineer (net personalty £27,934), left £34,533.

Mr. Hugh Hamlyn O'Connell, Southsea, late Superintendent Engineer, P.W.D., Madras, left £7,156.

The Excavations at Mizpah.

The Mizpah expedition of the Pacific School of Religion of the University of California, under the direction of its Dean, Professor Bade, which is excavating at Tel-en-Nasbeh, seven miles north of Jerusalem, has discovered what is stated to be an exceptionally fine and well-preserved Israelite house of the seventh century B.C. This has a street entrance, several rooms, a large stone basin, a bread trough, and a private cistern behind the house. A large four-handled earthenware pot containing the remains of food was found still embedded in the ashes of the fireplace, just as it was left when the inhabitants departed 2,500 years ago. A wine-press cut out of the living rock was also unearthed. It was in the form of a large square basin, from which the juice of the trodden grapes ran through a channel into a large vat, also carved out of the rock. The section of the city wall now in the process of excavation is 25 ft. 8 in. thick.

ROYAL ACADEMY EXHIBITION, 1927.

A Mask, Coloured Salt Glaze.

MR. GILBERT BAYES, Sculptor.

COMPETITION NEW

COMPETITIONS OPEN.

Civic Improvements, Birmingham, around Hall of Memory. International Competition Premium of £1,000 will be awarded author of design placed first. Further sum, not exceeding £1,000, will be divided among other competitors according to assessor's recommendation. Scheme includes : Municipal Offices, to contain City Hall, Public Library, and Lord Mayor's Mansion House. Mr. H. V. Lanchester, F.R.I.B.A., assessor. Apply Mr. Herbert H. Humphries, City Engineer, Council House, Birmingham..	Oct. 15 ..	Jun
Grammar School, Bradford, 1,000 boys. Premiums: £300, £200, and £100. Mr. Arnold Mitchell, F.R.I.BA., assessor. Apply Mr. W. Brear, Secretary, Grammar School, Bradford, Yorks. Dep. £1 1s. ..	Feb. 18 and Mar. 4 ..	Jun
Cemetery Chapel, Reading, for Corporation. Open to architects residing or practising in Berks, Bucks or Oxon. Premiums: 50 and 25 guineas. Apply Borough Surveyor, Town Hall, Reading. Deposit, £2 2s. Mr. Charles J. Blomfield, F.R.I.B.A., Assessor, 13, Ashburn-gardens, London, S.W.7, to whom designs have to be sent.	April 15..	Ju
Edwin Austin Abbey Memorial Scholarships for Mural Painting. Two Minor Scholarships of £125 a year each, and one Major Scholarship of £250 a year. Candidates must not be over 25 and 27 years of age for the respective Scholarships on December 31 preceding the competition. Apply Secretary, Edwin Austin Abbey memorial Scholarships, Chelsea Lodge 42, Tite-street, S.W.3	June 11 ...	Jul
University Buildings, Western Australia. To cost £150,000. Premiums : £400, £300, £200. Open to British subjects or citizens of U.S.A. Assessors: Professor Leslie Wilkinson, F.R.I.B.A., Mr. A. B. L. Wright, L.R.I.B.A., President Royal Institute of Architects of Western Australia, and Member of University Senate Apply Agent-General for Western Australia, "Savoy House," 115-116, Strand, London, W.C.2, or Australian Trade Commission, 44, Whitehall-street, New York, U.S.A...	Jan. 14 ..	Aug

Oxford : Secondary Schools.

The Education Committee of the To Council have recommended that the Cou Seal be affixed to the conditions for the c petition to be held for obtaining designs the two secondary schools proposed to built.

Designs for Houses, Easthampstead.

Architects and others are invited to s mit to Mr. E. Dennis Berry, clerk to Easthampstead Rural District Coun Bracknell, Berks, on or before the 25th stant, plans of houses of a suitable type be built in blocks of two or three houses to be accompanied by an estimate of probable cost per house. It is proposed erect 12 houses altogether.

Park Lay-out, Guildford.

The Town Council have decided to in competitive plans for the lay-out of St Park.

Royal Opening of Regent-street.

It is hoped and expected that th Majesties the King and Queen will officia open the new Regent-street in a few da time. Regent-street is Crown land, a every building in the street will be beflagg for the ceremony, and the decorations w remain for a week afterwards. Nearly the new buildings in the street are n finished, although it will be several m months before the Café Royal is comple at the back. There remains also an u finished building on the site of the "Oddenino" restaurant.

National Library for the Blind, Great Smith Street, Westminster. Detail of Entrance.

MESSRS. TATCHELL & WILSON, FF.R.I.B.A., Architects.

SIR GILBERT SCOTT AND THE NIKOLAI KIRCHE OF HAMBURG

By W. W. BEGLEY, F.R.Hist.S.

THE publication of a monograph on the Nikolai Kirche* affords an opportunity for drawing attention to this curiously neglected monument of the Gothic Revival. From an historical point of view the outstanding architect of the Revival is essentially Sir Gilbert Scott. He alone worked steadily through all the three marked phases of the movement, and by his assiduity compensated posterity for his lack of genius. "Labor ipse voluptas," the motto under which his drawings won the competition for the Nikolai Kirche, epitomises his life and was also the philosophy of his age. Pugin, Pearson, Butterfield, Burges and Street, each had a well-marked manner, virile and unmistakable; but Scott had only an adaptable instinct, a handful of "motifs," and a window wide open to the world.

The first phase of the Revival reached its height between 1820 and 1840, but with the advent of Pugin the exponents of Gothic were faced with the alternative of conformity with the new idea or of being driven into obscurity. In workhouses and churches Scott had turned out masses of typical work with mouldings and details copied, more or less accurately, though often in plaster, from those of the Middle Ages and with the rest of the design in the vernacular. His shrewd instinct, however, was swift to measure the strength of the contending forces. He became a Puginist.

During the second period, which lasted through the 1840's, architects strove, under the influence of the Camdenians and of Pugin's flaming propaganda, to re-create the Middle Pointed style and, here and there, almost succeeded in masking the flight of time. Scott's best work was done in this period. For a little while the enthusiasm of the artist possessed him and the Decorated style almost liquefied to his touch, and then the mantle of greatness settled on his shoulders and the rest of his life was occupied in trying to cope with the greatest practice of modern times.

The Great Exhibition of 1851 ushered in the third, and final, phase of the Revival. For the first time men saw assembled under one roof a wide range of materials, handicraft and manufacture. Improved transport had facilitated the studies of the Camdenians in the previous period and aided the production of more scholarly copies of the English mediæval work, but the march of progress went inexorably on. Architects returning from Continental trips wrote of the beauties of foreign styles and then, waxing bold, introduced the most exotic detail into their work. It was the beginning of the end. Although much of the best of modern Gothic work was produced after this, the battle was already lost and the movement eventually succumbed to this eclecticism. This was the period of Scott's greatest productivity. Re-using the inspiration of the Nikolai Kirche, and much of the detail, he produced a series of really beautiful churches, but as public enthusiasm for the Revival died down his churches became cold and academic and his civil buildings, with but few exceptions, singularly ungraceful and unhappy.

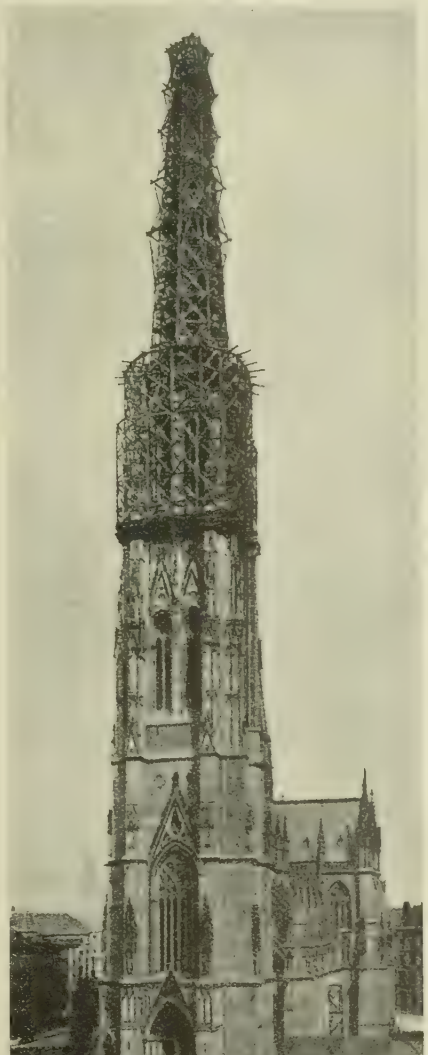
If the early works of Scott and his partner, W. B. Moffat, are compared with similar buildings by such contemporary architects as E. Blore or J. J. Scoles, it will be appreciated that there is nothing to choose between them for mediocrity. But Scott was not only hard-working but ambitious, and while Blore and Scoles slipped back into the second rank he went forward. Very soon after the formation of the Cambridge Camden Society in 1838 he turned his attention seriously to the study of Gothic, as interpreted by Pugin and the ecclesiologists. He never quite succeeded in gaining their approval, but that was reserved for a limited circle.

His first real success was the winning of the competition for the Martyrs Memorial at Oxford in 1840: the well-earned reward of a great effort. Fire provided him with his next opportunity, for on February 7, 1841, the church of St. Giles, Camberwell, was burnt down, and in view of the importance of the building considerable interest was aroused. Scott and Moffat won the competition, and the church was built in the years 1842-44. The design marks a considerable improvement in comparison with any of their previous efforts. The Camdenians objected to various features of the design and internal arrangements, t objections being chiefly based, as also in case of the Martyrs Memorial, on ecclesias incompatibility of temperament; but Sc next great work was to vex them even n so much so that even to this day justice not been done to one of the greatest build of the Gothic Revival, the Nikolai Kirc Hamburg. To the ecclesiologists of that it seemed almost shameful that one of number should design a Lutheran church.

Very little of value has been written a Scott's early career, and for this reason Faulwasser's careful and detailed study o Nicholas' Church should be of interes English students. It is true that it is str limited to a description of the building an the local events connected with its erec

The Nikolai Kirche, Hamburg: Perspective View.
SIR GEORGE GILBERT SCOTT, Architect.

* "*Die St. Nikolai-Kirche in Hamburg.*" von Julius Faulwasser, B.D.A., architekt. (Verein fur Hamburgische Geschichte.) Boysen & Maasch, Hamburg. pp. 186, 102 illus.; 16 plates; 12¼ in. × 9¼ in. M. 25.



rom the excellent plans, illustrations and press the reader will speedily realise that is to be found the key to much of Scott's work in England; certainly his best h work.

e again assisted Scott, and this time fire ich a scale and followed by such a com- on as also to raise a comparison with Wren he Great Fire. From May 5, 1842, fire for five days in Hamburg, burning the st and wealthiest part of the city, of the public buildings and three of ve principal churches, including old St. olas. The townsmen were possessed of derable civic pride, however, and within ek a technical commission of architects engineers was set up to consider the re- ing and rebuilding of the central part of own. Their first full meeting was held on 18, 1842. Meanwhile, a committee had een set up to promote the rebuilding of Nikolai Kirche, and they, too, lost no time, g an appeal to the citizens on October 18. considering various proposals and de- upon a new site for the church, to the ard of the old building, they advertised en competition for designs, on May 28. The plans were to be to ½-in. scale and to provide 1,200-1,400 ordinary sittings, a maximum accommodation of 3,000. style was left to the free choice of the titors, but a tower was insisted upon. stimated cost was not to exceed 1,500,000 s, and the closing date for the submission awings was fixed for November 30, 1844. December 19 the drawings received were d on public exhibition, but some days an English ship which had been ice- d in Cuxhaven came in, bearing on board sign from one of the competitors, Sir rt Scott, whose agent received them with derable ceremony and handed them over Committee.

Hamburg merchant had drawn Scott's tion to the competition and advised him er for it. Scott needed no second invita- His relations with his partner Moffat becoming very strained and were soon finally severed. The workhouse-design- age of his career was over and his name ning known. From mediocrity his art entering upon the formative phase and, y as a result of his activities in connec- with this competition, was to touch the s of greatness for a while. During the ter of 1844 he travelled abroad, first in am and then in Germany, mastering the rarities of German Gothic. While in ne he made the acquaintance of E. F. ner, the architect in charge of the work s cathedral. This friendship was to serve n better stead than he then knew.

ty-two competitors submitted 44 designs, 9 drawings in all. With the exception of Dane and two Englishmen—Scott and . Atkinson, of Hull—all the competitors r German, and among them were some ns men. The assessor died before com- g his work, but it was known that he placed Professor Gottfried Semper t Professor Strack second, and Scott r. At this juncture Professor Zwirner s called in, and his award, issued May, 1845, put Scott in the first d with Professor Strack second and dig Lange third. The award was adopted, e a bitter controversy between Semper he Committee. The foundation stone was n September 24, 1846, and the building ssed steadily for nearly thirty years, the s not being fixed on the spire until st 26, 1874, although the building was ed in 1863. The magnitude of the task le realised from the cost, which ultimately ed nearly a quarter of a million sterling, ry large sum for those days.

T mediævalists of the 1840's had very ideas as to what an architect might not though on the positive side their views r hazy, and it is interesting to observe closely Scott conformed to their prejudices. ntemporary critic of the building might have written thus: "The style of the ng is Middle Pointed handled with facility and grace; the plan is cruciform, with well-proportioned transepts, a polygonal eastern apse, and a western tower and spire; the extreme length of the church being 281 ft., the breadth across nave and aisles 78 ft., and the internal height to the vault 88 ft. 6 in., while the tower, with its spire, rising to a height of 483 ft., is a veritable giant and beautiful both in outline and proportion. The chancel is correctly planned and fitted and the building vaulted throughout." Yet such a criticism was not written. The work itself was passed over in silence and Scott received a severe scolding in the columns of the

The Nikolai Kirche, Hamburg.

Ecclesiologist because he had undertaken the work; for it was a Lutheran church. This probably explains why it is that writers like T. F. Bumpus, in referring to the obvious foreign influence shown in Scott's churches after this date, have entirely overlooked the obvious source of that influence. Space does not permit of the naming of more than a few typical examples, but the gabling of each bay of the aisle roofs of St. Paul's, Dundee (1853), of St. Andrew's, Westminster (1854), and St. Mary's, Stoke Newington (1855), is certainly derived from the Nikolai Kirche; while the polygonal apse, lighted by tall two-light windows, to which Scott afterwards became so partial, using it at St. Mary's, West Derby (1855), Exeter College Chapel, Oxford (1856), Harrow School Chapel (1857), and St. John's College Chapel, Cambridge (1863), as well as in the previously mentioned examples, is also directly traceable to the same source.

St. Mary's, Stoke Newington, which is almost a copy of the Hamburg church as regards plan and mass, although on a much smaller scale, affords an interesting comparison, although here, as in all the other English examples, the effect of the interior is greatly impaired by the altar being placed against the east wall instead of in the correct position, on the chord of the apse, as at St. Nicholas. On this point, however, Scott encountered strong ecclesiastical prejudice. Only within quite recent years has it been possible to revive the old position, as at Lancing College chapel.

In his English churches Scott had perforce to be content with a reredos consisting of the Tables of the Law or, at a later date, a low panel sculptured or painted. At Hamburg he adopted the latter form, but in such a way as to produce a remarkable effect. A ring of life-size figures of saints surrounds the apse and, from the centre of the reredos rises a great marble crucifix, carved by J. R. Clayton, dominating the whole. It is interesting to note that all the carving in the chancel, as well as to the tower, was executed by an English firm and that the pulpit and font were carved by them in England. The stained glass in the apse and also in certain other windows, including one inserted by Sir Gilbert Scott's sons in fulfilment of his wish, is by another English firm. Other works, among which is the cross surmounting the spire, are also by English craftsmen; while two English clerks-of-works, in succession, who are commemorated in the building, supervised the erection of what is, despite the attempt to introduce German detail, a typical specimen of English art.

CORRESPONDENCE

Salaried Architects and Private Work.

SIR,—I often think that architects are very short-sighted people; some of them do not seem able to look beyond their little, or big, noses. Objection is made to salaried architects doing private work. In their own interests, and also in that of architecture, architects as a body should do all they can to promote the idea. The agitation I refer to has done us so much harm in the past. Take the case of District Surveyors: years ago the leading architects of the day were allowed to act as District Surveyors; certainly their architectural influence in those positions must have been extremely influential, and I know it was used for the good of the public and architecture generally. Leading men of the day, such as Professor Aitchison, R.A., Professor Roger Smith, Thomas Henry Watson, and many others in private practice, had nice little additions to their incomes, and the result was satisfactory to the profession, and, to my mind, excellent in every way. In those days there was keen competition for the post of District Surveyor, and men like E. W. Mountford and others passed the qualifying examinations.

I wonder when men will realise that there is no difference, in principle, between salaried architects doing private work, and architects in private practice accepting public appointments. Take the case of a small provincial town: the Borough Engineer may not be a qualified architect (by that, of course, I do not mean simply a member of the R.I.B.A.), and the result of his architectural work may be deplorable; but if a qualified local architect, in private practice, also held the post, the result would be very different: the public, architecture, and the profession would benefit. If we wish to further the interests of architecture, and the good of the profession generally, we should advocate the old system of salaried architects carrying out private work, and promote the idea of architects practising privately accepting public appointments. We should try and insist on a clause to that effect when appointments are advertised.

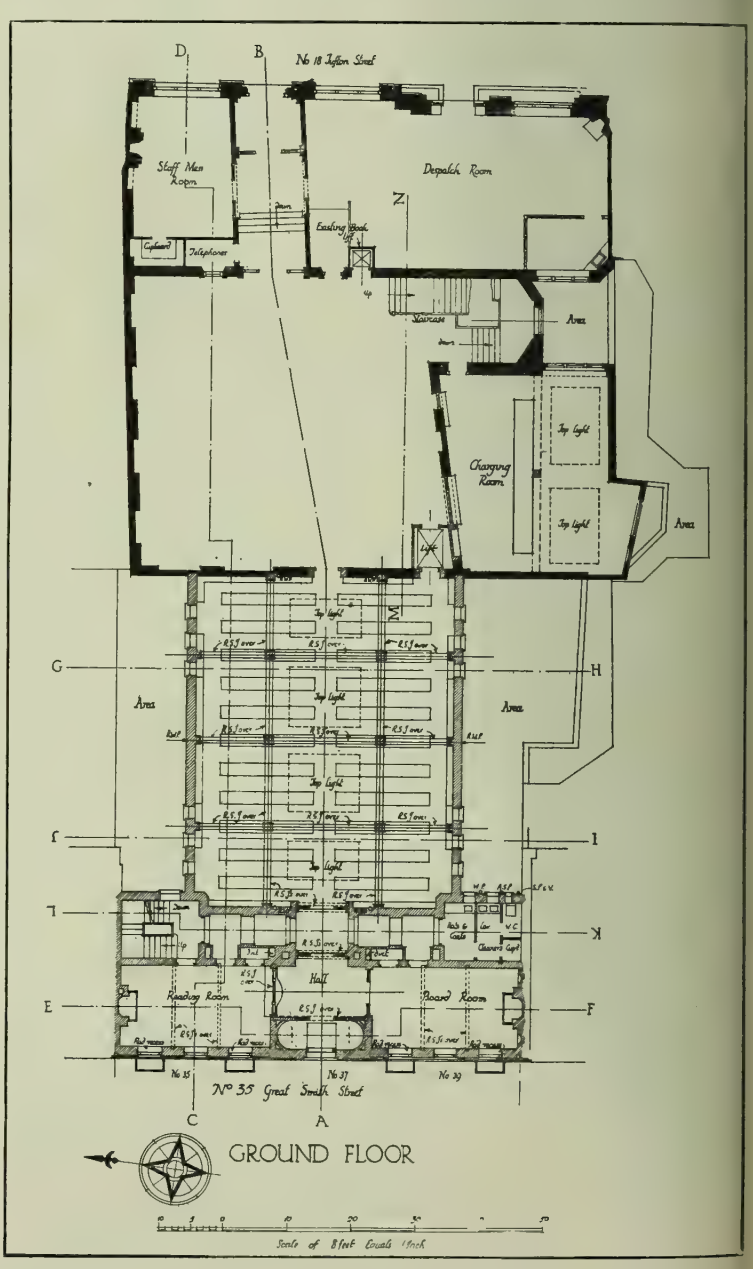
"Coleton Fishacre," Kingswear, S. Devon.

This house, for Mr. Rupert D'Oyly Carte, is built on the south Devon coast some three miles from Kingswear. It stands in a valley running down to a cove. The site and approaches were very steep, which influenced the setting out and planning of the house. The house is built of local stone quarried out of the hillside a little distance below the house. The roofs are covered with Delabole slates. A small stream runs down the valley, which will form an attractive feature of the garden. The house and gardens were designed by Mr. Oswald P. Milne, F.R.I.B.A.

The general contractor was Mr. E. H. Burgess, of Berners-street, W.1, and the following were sub-contractors :—Benham and Sons, Ltd., heating work; T. Clarke and Co., Ltd., lighting; Doulton and Co., sanitary fittings; Hadden and Pearce, Ltd., electric fittings; Bath Artcraft, Ltd., oak panelling and special furniture; Eagle Range and Grate Co., range; Wm. Smith, iron casements and wind vane; Negretti and Zambra, wind vane; Carter and Co., Ltd., tiling (walls); H. T. Jenkins and Son, Ltd., marble fireplaces; Quicksey Cabinet Manfg. Co., kitchen dresser; Comyn Ching and Co., door furniture; Fernden Fencing Co., Ltd., fencing; A. H. Herbert and Co., Ltd., slating; Setchell & Sons, Ltd., Old Delabole slates.

Reception Hall, University Arms Hotel, Cambridge.

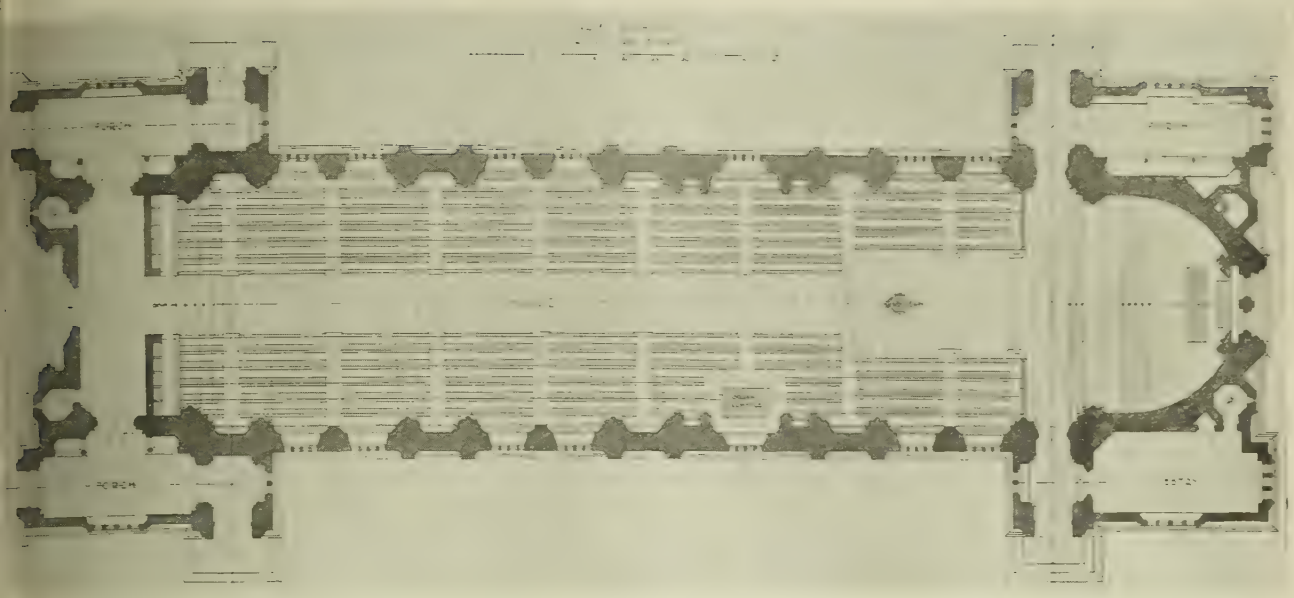
The reception hall of this hotel is a part of large extensions and alterations designed by Mr. George J. Skipper, F.R.I.B.A., architect, of Norwich and London. A view of the portion towards Parker's Piece, and a plan, were published in our issue for July, 9, 1926. This hall, although in use, is not yet carried out in full accord with the design we illustrate, but it is hoped that an early opportunity may arise to complete the design, as we understand that the decorative features shown are prepared, and to a large extent are merely waiting to be fixed.



The general contractors for the work are Messrs. Kidman, builders, of Cambridge. The decorative plaster work was modelled by Mr. Crotch, of Norwich, and the fixing and general plastering was executed by Messrs. Bond, of Cambridge. Messrs. Haden, of Trowbridge and London, are responsible for the hot and cold water services, as also for the electric lighting, bells and telephones throughout. Many of the floors are finished with tiles made and supplied by the Novocrete Company, of Argyle House, Regent Street, W., some in the more important rooms are polished and laid to pattern very effectively. Messrs. Waygood Otis supplied the lift, and Mr. Savell, of Cambridge, carried out the lead glazing. The constructional steelwork was supplied and fixed by Messrs. Dawnay, of London. Messrs. Morris, of Rochester Row, were responsible for the lay light in dome, and Messrs. Singer, of Frome and London, made the wrought-iron balconettes and other work. The bathrooms and lavatory walls and floors are finished in Terazzo by the Art Pavements Company of London. The spring dancing floor is by Mr. H. Moreton Junr., of London. Messrs. Braby covered the turrets with copper. Messrs. Gray & Co. fixed the lightning conductors, and Messrs. Mather & Platt the fire hydrants. The asphalt roofing is by the Val de Travers Co., and Messrs. Haskins supplied the revolving shutters to garage.

Charterhouse School War Memorial Chapel.

The site of this building is a level plateau, with the east end of the chapel at the top of a steep slope down to the road, from which a striking view of the building can be obtained. There has been no general contractor in the ordinary sense of the term. The building has been carried out by a staff of workmen under the supervision of the resident clerk of works, Mr. A. Boxall. The walls are faced externally with Bargate stone, from a quarry on the school grounds, only a few hundred yards from the site. The dressings are of Weldon stone, except in the more exposed positions, where Clipsham stone dressings have been used. Internally the walls are plastered with dressings of Weldon stone. The roof is covered exter with hand-made sand-faced tiles of a grey tone. The ceilings are plaster-va with transverse arches of Weldon stone. important feature of the design is the f tration, the building being lighted by lancet windows running up well into vaulting. These windows are set well from the infernal wall face, so that looking up the chapel from the end, pr cally no windows are visible except the window. The focal point of the design ternally, is the reredos, which is inte to express the function of the building war memorial; the "sarcophagus," forms a portion of the reredos, is introd to suggest this idea. Another prom feature of the interior is the seating, its panelling and canopies; this seating, continuous along both sides of the ch forms a darker band to contrast with white plaster above. The organ is al installed, in two sections—one at each of the building. The case-work will be as soon as funds are available for this pose



Sir Giles Gilbert Scott, R.A., F.R.I. is the architect.

ie new building, designed by Messrs. hell and Wilson, FF.R.I.B.A., for the ional Library for the Blind in Great h-street, Westminster, is an extension of existing premises in Tufton-street, once pied by the Architectural Association. ie basement, second and third floors of new building are entirely devoted to ving accommodation, as also are the gal- s to the ground and first floors. The portion of the building contains the nce hall, with reading room and board on either side and administrative offices

rking bricks have been used for the ex- al facings, with Daneshill red dressings a Portland stone ground story and main ce.

e general contractors were Messrs. Higgs Hill, Ltd., of Crown Works, South Lam- road, S.W.8. The principal sub-con- ors were as follows:—Smith Walker, constructional steelwork; the Luxfer Ltd., metal casement windows, lantern s, etc.: Kleine, Ltd., fire-resisting floors roof; Jacob, White and Co., Ltd., elec- ight and power; Durbin and Katesmark, rary and hot water installations; Bell's ned Asbestos Co., Ltd., jointless floors; s Bros. and Co., Ltd., woodblock floors; sh Vacuum Cleaner and Engineering Co., cleaning; W. Bainbridge Reynolds, metal work; Martin van Straaten and wall tiling; James Ritchie and Sons, Ames and Finnis, roof tiling; Estler hers, steel shelving; Heal and Son, Ltd., ture; the Birmingham Guild, Ltd., name s; Bratt, Colbran and Co., Ltd., fire- s; Mather and Platt, Ltd., fire ap- es; the Dictagraph Telephones, Ltd., e telephones; Thomas Faldo and Co., asphalt.

e stone carving was carried out by Mr. George Alexander, R.B.S. Mr. Hutton was the general foreman and Mr. H. W. Simpson the quantity surveyor.

Royal Norfolk and Suffolk Yacht Club House, Lowestoft.

This yacht club-house, built some years ago, is too small for its members, and the London and North-Eastern Railway Company, the owners, are considering the addition of suitable rooms for the accommodation of the lady members of the club. It is hoped this design may be speedily put into execution. The architect is Mr. George J. Skipper, F.R.I.B.A., of Norwich and London.

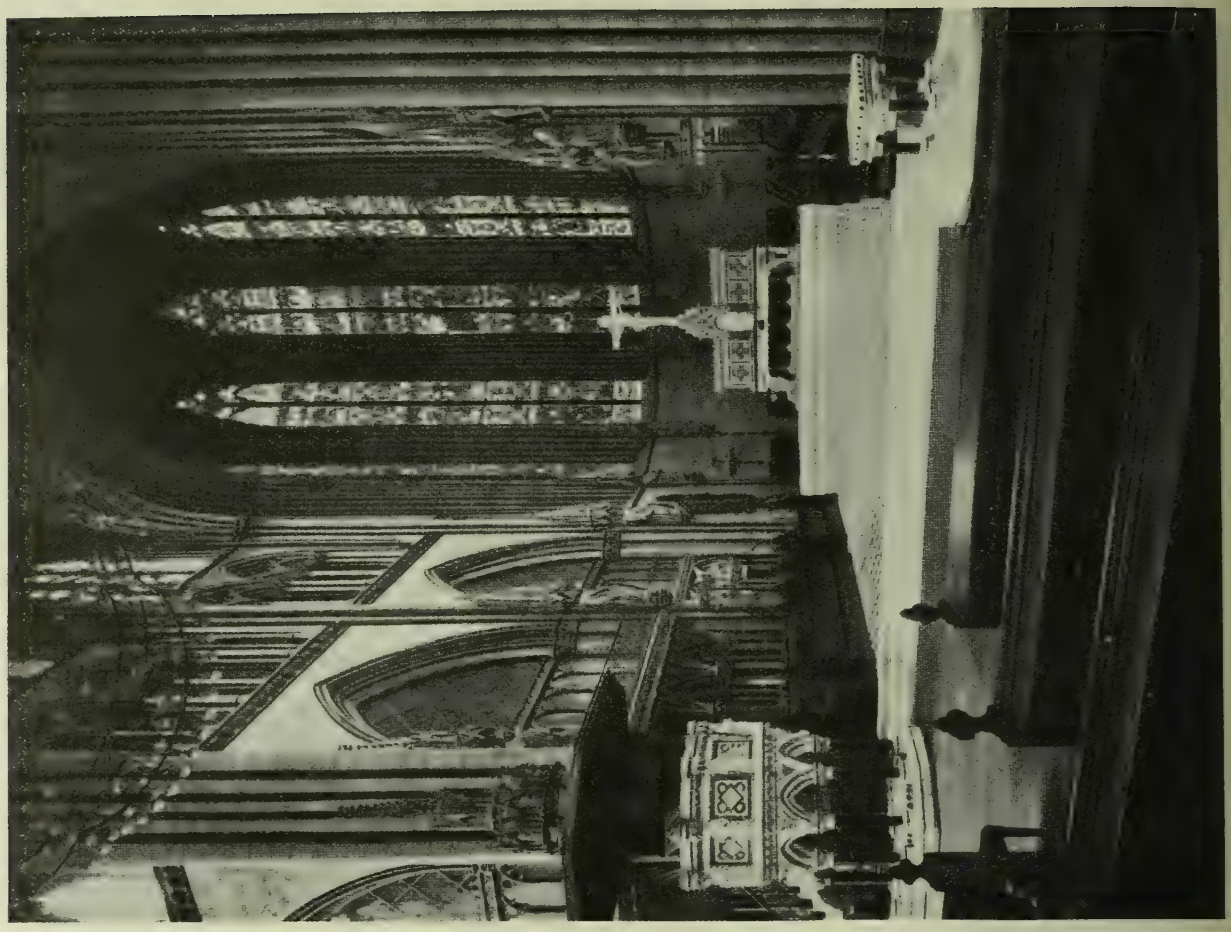
Cottages at Upton, Norfolk.

This group of cottages was designed as a housing scheme for the Blofield Rural District Council for Upton under the first Housing Act. Mr. George J. Skipper, F.R.I.B.A., of Norwich and London, is the architect.

Hayes Church, Middlesex.

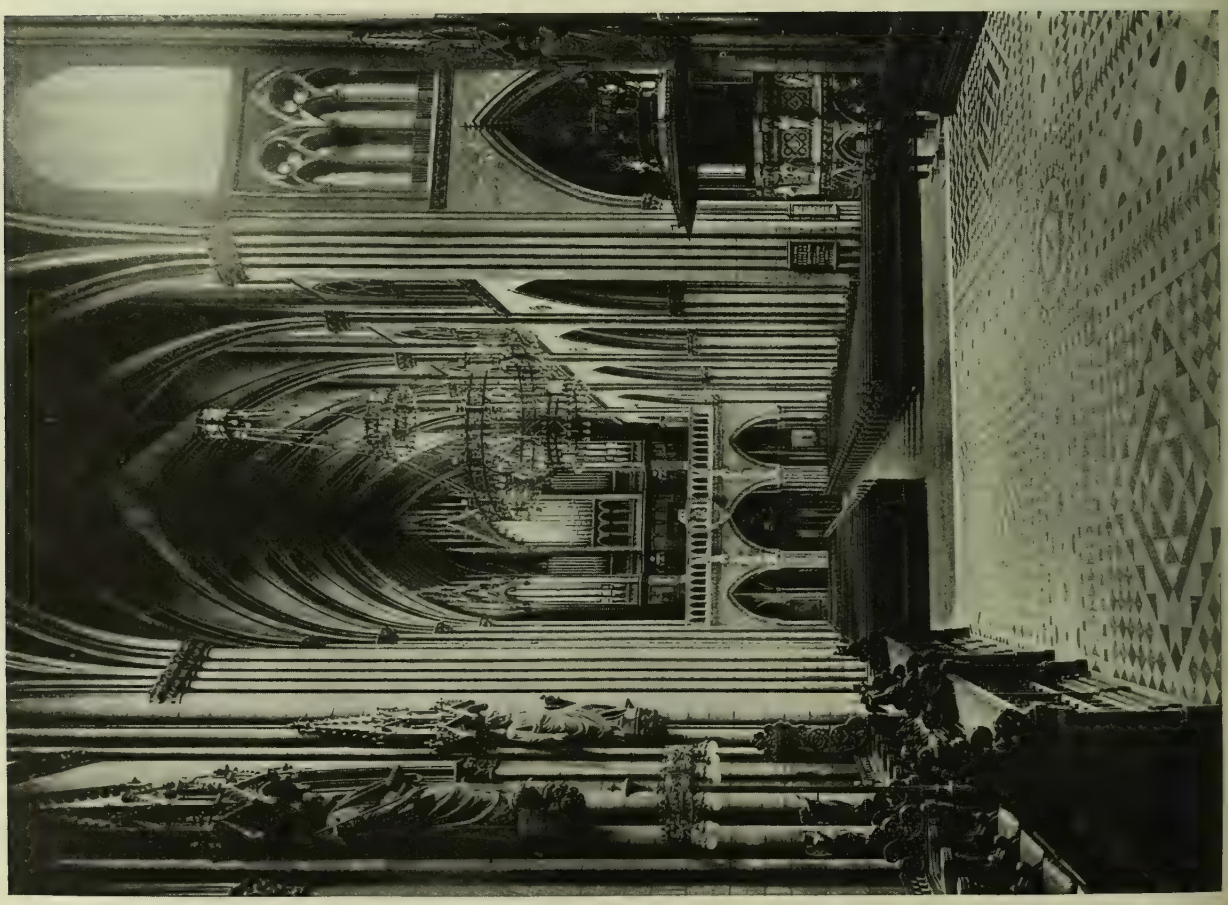
The new Church of St. Anselm, at Hayes, Middlesex, for the London Diocesan Fund, is now being built. The general walling inside and out is a local stock brick, with some variety of colour, relieved with Binfield red brick quoins, courses and dados, the splayed reveals of the windows inside being also red. The tracery and dressings of the windows and the nave arcade piers are in Welldon stone and the sills in Clipsham. The arcade is in three orders of splayed red brick. Old Delabole slates are being used for the main roof over the nave, and the flat roofs of the aisles and vestries are of reinforced concrete, covered with Faldo's asphalt. Framed principals carry the nave roof and support the inner ceiling, which is to be panelled and decorated in colour. The heating is by Messrs. Rosser and Russell, and the general contractors are Messrs. Wooldridge and Simpson, of Oxford. The architect is Major Hubert C. Corlette, F.R.I.B.A., of 2, New-square, Lincoln's Inn, W.C.

Science School, Clifton College.



This school, which was recently opened by the Prince of Wales, consists of three floors and a basement. The main central block contains the laboratories and their adjuncts, and the wing blocks, of two stories only, the lecture rooms. The somewhat recessed position of the building was dictated by the desire to preserve the whole of the existing close for recreation. The ground floor has two side entrances to the wing blocks in addition to the central entrances at the front and back—the latter for goods. This floor is devoted to physics, and contains on the frontage two large elementary laboratories 40 ft. by 32 ft., to hold 30 boys each, behind which, on the other side of a central corridor, are on the right, an advanced laboratory, 37 ft. by 20 ft., and dark room, and on the left of the central staircase a large workshop for laboratory repairs and masters' private research, room. The two lecture rooms in the wings with preparation rooms attached, belong to this department. The first floor is occupied by the chemical department, arranged as on the floor below, with the large elementary laboratories on the frontage, and between them a balance room and dispensary for apparatus. An advanced laboratory, biological laboratory, masters' room, polarimeter room and store accommodation occupy the rear rooms. The second floor, over the frontage rooms only, provides a science library, 40 ft. by 22 ft., fitted in oak, and a similar-sized geography room. Flat roofs at this level provide ample space for experimental work in the open. The basement, confined to the rear of the building, houses the heating plant, switch boards and batteries, and gives ample space for handling goods, for which a small lift to the upper floors has been installed.

Mr. Alan E. Munby, M.A., F.R.I.B.A., of 9, Old Square, Lincoln's Inn, W.C., is the architect.



The general building contractors were Messrs. Henry Willcock & Co., Ltd., and the general fittings contractors, Messrs. Halstead Bros. The following were sub-contractors:—G. N. Haden & Sons, Ltd., heating; Buchanan & Curwen, electric lighting and power; Young & Co., steelwork; Stuart's Granolithic Co., Ltd., granolithic stair and pavings; W. James & Co., Ltd., steel casements; The Old Delabole Slate Quarries, slating; Yannedis & Co., ironmongery; The Cashmore Art Workers, rainwater goods; F. & R. Edbrooke, ironwork; The Reliance Telephone Co., Ltd., telephones; Broad & Co., Ltd., floor drains; Brown & Son (Alembic Wks.), Ltd., gas and water fittings; Oates & Green, Ltd., sinks; James Keith & Blackman Co., Ltd., ventilation; Bell's Poilite and Everite Co., Ltd., asbestos trunking and hoods.

THE TOWN PLANNING INSTITUTE

Mr. W. R. Davidge (President) took the chair at the annual meeting of the Institute, held at Caxton Hall, Westminster, on June 10. Mr. G. L. Pepler (hon. secretary), in submitting the auditors' report, said they were in a fairly satisfactory financial position and had accumulated a little reserve, but they were a long way from the stage when they were able to have premises of their own.

As there were no fresh nominations for the Council, the old members were re-elected. At a later stage, Mr. Montagu Harris was elected President.

A vote of thanks was passed to the President and Council, the hon. officers and Mr. A. Potter, secretary, for their services.

Mr. Davidge, in reply, touched on the activities of the Association during the year, and referred to the work done in connection with the Royal Commission on Thames Bridges, the memorandum on Built Areas, and the consideration of street crossings. Thirty-three new members had been elected. One examination had been held at which 16 people sat, of whom five passed. It was proposed to hold the autumn session at Winchester the second week-end in October.

On the motion of the President, it was agreed that the Council may from time to time elect as an hon. corresponding member any distinguished person who is not a British subject and not residing in or practising town planning in Great Britain or the British Dominions beyond the seas, and who, by reason of either his position or his experience in matters relating to town planning, appears to the Council to be able to render assistance in promoting the objects of the Institute.

The Work of the Session.

The President, in his concluding address, gave an interesting survey of the papers read during the past session. Referring to the subject of "Decentralisation," he said it was from concentration in towns that we could trace most of the urban evils. The L.C.C. was faced with the necessity of something like 17,000 additional houses every year to accommodate the normal increase of population, and something like 2,000 acres of countryside were eaten up every year by bricks and mortar. The L.C.C., with a falling population in its own area, proposed to build 12,000 houses a year, and its budget provided for something like £6,000,000 for 12 months' expenditure on housing, practically all either outside or on the borders of the county. The L.C.C. was exporting population. Why not take them a little farther into the real country, where they could do their work in comfort and live in pleasant surroundings without the necessity of strap-hanging and daily traffic troubles and dangers? The two garden cities of Letchworth and Welwyn were excellent examples of what could be done by the devoted effort of a limited number of keen and capable men. Why should not London itself spend its millions in building many such communities, instead of still further congesting the suburbs and overcrowding every means of transport?

Position of Town Planning in Greater London.

Mr. G. L. Pepler, in the course of a paper on this subject, said it was appropriate that with Mr. Davidge as president, the session should have been devoted principally to the London Region. He had been asked to give a brief summary of town planning progress in the region. The item of first importance to record was the Conference held by Mr. Neville Chamberlain on December 6th, 1926, when, as Minister of Health, he addressed a gathering of representatives of 154 local bodies functioning within the 2,000 square miles that comprise the London traffic area or Greater London region. That conference enthusiastically decided to recommend the setting up of an Advisory Joint Town Planning Committee for the whole region. The great majority of authorities had already signified their assent and representatives were now being appointed by the existing regional groups. Already there were twelve Joint Town Planning Committees established in the region, and covering practically the whole of it save the County of London and a small section in the north-east corner. Of the twelve committees, those for West Middlesex, Thames Valley, North-West Kent, South-West Kent, North-East Surrey and West Kent had completed plans and reports, and those of the first two named had been published. The South Essex Committee had also approved a preliminary report setting out some of the facts of the situation and the guiding principles to be followed in the preparation of their plans.

The Hertfordshire, West Surrey, Mid-Surrey, North-West Surrey, North Middlesex, and South Bucks and Thames-side Committees were all engaged in preparing reports and plans. Other Joint Town Planning Committees were operating just further out. The major committee, now being formed, would be able to extend the field of co-operation by co-ordinating these regional plans and proposals and bringing them into relation with the central core, so that at long last the dreams of town planners might be realised and the planning problems of the capital city of the Empire and its environs might be dealt with over a field sufficiently large to make a fruitful solution possible.

This larger co-operation was no doubt encouraged by the work of the Arterial Road Conferences, summoned by Mr. John Burns in 1913. This voluntary combination of local authorities, government departments, representative societies, institutions and associations did a notable piece of regional planning in producing their great scheme of arterial roads, based largely on the original proposals of Col. Hellard, for an area of about 1,000 square miles. They might well be encouraged by their experience, for he remembered several of the delegates remarking that few of the projects (they were planned without reference to local boundaries or as to who would pay for them) would be realised in their time; and yet, to-day, owing to increasing traffic pressure, to the necessity to relieve unemployment and to the energy of the Ministry of Transport and of the counties, nearly all these roads and others were in being or in course of construction. The existing Joint Committees that had prepared their plans had not then ceased to function, but had been kept in being to continue the pooling of knowledge and experience, to maintain the regional aims, and to regularise the adaptations that the march of events may indicate to be desirable. This Institute might be allowed to take reasonable pride in the fact that all these committees had been advised by one or more of its members.

There were 133 town planning authorities in the London traffic area, and of these nine had completed schemes, of which six had been finally approved. One authority, namely, Croydon County Borough, had prepared three schemes, of which two had been approved. Also 42 preliminary statements had been prepared and 25 approved. Within the Hertfordshire region two groups of authorities were preparing statutory schemes, jointly. Altogether some 50 schemes had reached the preliminary statement stage, or beyond; the largest group being situated in Middlesex. Mr. Stewart had kindly plotted on one map the principal proposals of the schemes and preliminary statements that had been prepared, and happily they indicated the value of the work of the Joint Committees, in that, in the main, their proposals were incorporated, and the individual plans fitted in well with each other.

The speaker then gave particulars of roads of more than local significance that had been included in preliminary statements, or returns already prepared; usually in co-operation with the County Councils.

In many schemes, he continued, the amount of open space reserved fell far below the standard set by the National Playing Fields Association, but, on the other hand, in West Middlesex, Gunnersbury Park had now been secured by the joint action of neighbouring authorities; and the proposals of the Joint Committee for the reservation of belts of land alongside streams were being implemented in the schemes of several authorities. These streamside parkways were economical in that they usually covered land not likely to have much building value; they formed admirable defining intervals between places, and they gave opportunity for pedestrian paths, clear of the modern bustle of the roads. Ruislip Northwood had reserved a number of these green strips, and they occurred in the schemes of, for example, Uxbridge Rural District, alongside the River Colne and other streams; Greenford and Brentford, along the River Brent; Maldens and Coombe and Surbiton, along the Hogsmill River; in Southgate Pymmes Brook; and in Finchley, by Mutton Brook. Sidcup proposed to reserve a number of strips of this nature, and Heston and Isleworth proposed to secure access, not only along practically their whole frontage to the Thames, but also to the River Crane on their west.

Chiswick originally reserved the whole of Devonshire Meadows alongside the Thames; Uxbridge Rural District planned to keep open about 1,250 acres, or nearly 10 per cent. of the area; Croydon, with the splendid help of Mr. Stenton Covington, made a most attractive addition to "The Rookery" open space of the London County Council adjoining Streatham Common; Ealing reserved about 6 per cent. of one area; Chingford proposed to reserve some 58 acres; Greenford (now Ealing) to save some large areas of public and private open space, including Horsendon Hill and various playing fields; Southgate had reserved about 78 acres, etc.; but the most generous scheme in respect to public and private open spaces was that prepared by the London County Council for the South-Eastern corner of the county, where they proposed to reserve some 2,069 acres or nearly one-third of the area of the scheme, no doubt having in mind the serious shortage in other parts of their county.

The reservation of land for agricultural purposes was not yet a common feature of plan in the London region, but Uxbridge Rural District had made proposals in this direction.

Not every district requires an industrial zone to itself, but where they had been planned it would be found that those of adjoining districts now fitted in with each other. For example, in the locality of the Grand Junction Canal and the Great Western Railway, there was a belt of land reserved for industry occurring in the Uxbridge and Greenford (near Ealing) districts. Also a fairly large industrial area was planned on the low-lying land where Ruislip—Northwood Urban District, Hendon Rural District, Uxbridge Rural District, and Harrow Urban District, were contiguous.

New civic centres had not yet been planned in many cases, but proposals had been made to reserve land for public buildings in, for example, the Ruislip—Northwood scheme—a site on entirely undeveloped land on the line of a proposed main avenue—and the Harrow scheme, where the site has a frontage to two existing roads close to the railway station. Heston and Isleworth proposed to reserve land for school sites and several authorities proposed to earmark land for cemeteries or cemetery extensions.

Ruislip—Northwood was, he thought, the only district to have exclusive shopping areas. In general, shops were allowed free entry in centres where some had already appeared and in some cases selected places were reserved for them primarily, but other buildings were allowed by consent. In some instances a difficulty was arising because these reserved areas had become filled up with dwelling-houses, which rather threw out of gear the balance of the plan. This would, however, no doubt be rectified by

ubsequent subsidiary zoning. Densities aried from three to the acre, in a select esidential neighbourhood, to the general verage of 12, and in some districts there vas a desire to zone largely at a lowish lensity, apparently with a view to encouraging property of a profitable character rom the point of view of rates. Ruislip—Northwood was, of course, a pioneer in regard to control of design, and the first uthority in the region to complete a town-lanning scheme.

Time did not permit a detailed survey of ll the proposals that had been put forward y individual authorities, in preliminary tatements or schemes, or any reference to hose that had not completely reached either f those stages, but those quoted indicated hat a great deal of beneficent work was in and, even if not all that they would like, nd that most of the "tricks of the trade" f the town-planner had been incorporated n one scheme or another. The danger, of ourse, was that such items should be proosed because they were recognised feaures of town plans, whereas from the reional point of view one of them might be uite inappropriate in a particular place. Dr. Unwin did well to remind them that within the 2,000 odd square miles of Greater ondon, alone could be housed, at 12 houses o the acre, about twice the population of England at the last census! Happily an impossible happening, but the margin of space ndicated that there was ample room for videspread decentralisation without undue encroachment on the countryside, provided he whole operation was scientifically controlled and with due regard to the great nd essential industry of agriculture. Town-planners could see, despite recent neglect, enormous future possibilities for London.

Mr. Stilgoe (Chief Engineer, Metropolitan Water Board), in proposing votes of thanks to the readers of the papers, expressed his pleasure that so many of the proposals they had discussed in the early days of the Institute had materialised. There was still need, however, in regard to planning to take the mperial view and try and fit in with neighbouring areas. In regard to the arterial roads, some were laid out with little regard to development so far as public services were concerned.

Mr. D. Barclay Niven seconded the motion, and called attention to the need for labelling areas on the outskirts of London so that when going through them by road people would know where they were.

Col. Vaughan Morgan referred briefly to the London Playing Fields movement, and thought something would be done which would be a landmark in the way of open spaces.

Mr. Jackson (Chairman of the Thames Valley Joint Committee) referred to the proposed electric power-house at Chiswick, and said it was a question which could never have arisen had the Greater London Committee been in existence at an earlier stage.

Mr. E. Willis (Chiswick) pointed out that in regard to the proposed power-house he had in the past opposed the use of the land in question for industrial purposes, but the position was altered when the local authorities wanted the site, which all the experts said was the right site to supply the needs of consumers in the western portion of London. In the circumstances he felt it was right for Parliament to decide the matter.

Mr. E. R. Abbott made the suggestion that the Carnegie Trustees would do well if they would provide funds for laying out land after the local authorities had purchased it.

Mr. Marsden thanked the Council for the assistance rendered to the Northern Division.

The President, in reply, said that bye-pass roads should be for traffic purposes, and development should be discouraged.

Mr. Pepler said that they were aiming at aspect development with open country, and this would fit in with the saving in the cost of public services. As to the naming of places, what they were out for was to define places by making them have a separate identity.

CORRESPONDENCE

(*Continued from p. 965.*)

R.I.B.A. Premises—a Suggestion.

SIR,—I note from your columns that the Royal Institute of British Architects is considering the erection of premises more befitting such a body on a site yet to be decided upon. No doubt many suitable sites could be found, but there is one which is apparently available that seems to have particular advantages for such a purpose. It is in Great George-street, Westminster. It is between the fine building of the Institution of Civil Engineers and the Surveyors' Institution. It is opposite H.M. Office of Works, quite near the Houses of Parliament, and only 200 yards or so from the Institution of Mechanical Engineers and the Storey's Gate entrance to St. James's Park. When I passed there last the site was up for sale and the old buildings being demolished, so that it is ripe for the erection of another fine building in what is becoming a street of fine buildings which can never be spoiled by shops or other buildings that would not be suitable in juxtaposition to the headquarters of a number of professional institutions.

Perhaps I should add that I have no interest whatever in this site. SITE.

Control of Architectural Design.

MR. E. GUY DAWBER, A.R.A., P.R.I.B.A., writing as Vice-President of the Council for the Preservation of Rural England, has addressed a letter to the *Times* on "Bad Building," from which we take the following extracts :—

"The cause of the deplorable condition to-day of the building of the vast numbers of small houses in every direction is that the control of the designs, and in many cases the making of them, is and has been in the hands of people unfitted for the work. I say this without the least intention of being offensive, but is it not unreasonable to expect lay committees of local tradesmen, farmers, and others to pass, criticise, or condemn plans or drawings laid before them without the least technical knowledge of what the buildings may look like in execution, or only acting upon the advice of their surveyor, who may doubtless possess a sound knowledge of roadmaking and sewerage works, but in many cases is without the least asthetic or architectural training? One might as well expect the same committee to prescribe the treatment of the cases in their local hospitals, with perhaps the matron to advise them.

"There are scores of small houses scattered throughout the country, built within the last few years, which are a pleasure to look at, simple and unaffected, suitable to their surroundings, and in every way an addition to the beauty of the countryside, but these are by architects of sympathy and understanding, and form but a negligible fraction of those that are built by speculative tradesmen or builders, and which are offensive and stupid in their meaningless vulgarity. These are the houses we see on every side.

"It is difficult to understand that without the least protest the country should see what is nothing short of a national disaster going on before its eyes. What Sir William Forwood says about the Lake country applies with equal force in other districts. What will happen to the Chyngton estate, near Seaford, Lord Leconfield only too truly predicts. What is happening throughout the South Coast, where tracts of exquisite country are ruined, is known only too well. The peaceful country of the Broads in Norfolk is rapidly being spoilt, and on the River Thames and numerous other places the quiet charm has been lost by the ill-considered buildings allowed to be put up.

"The Council for the Preservation of Rural England is devoting its energies towards trying to remedy this condition of things, and to get some proper system of control over the designs of these new buildings, and in its efforts it appeals for the support of the public, as, unless steps are taken quickly, it will be too late."

SOCIETIES AND INSTITUTIONS

SURVEYORS' INSTITUTION.

Annual Country Meeting.

The arrangements for this meeting, which will be held at Harrogate from June 22 to 25, are now complete, and the Reception Committee of the Yorkshire Branch have prepared an attractive programme. Apart from the business meeting, which will be opened by the Mayor of Harrogate on June 23, excursions have been arranged to a number of places of interest in the neighbourhood, including Fountains Abbey, Knaresborough, the City of York, Wentworth Woodhouse (by kind invitation of the Earl Fitzwilliam), the Leeds Corporation Washburn Valley Afforestation and Waterworks Schemes, and Bolton Abbey. A golf match against the Harrogate Law Society, and competitions for prizes offered by the Chartered Surveyors' Golfing Society, will take place on Saturday, June 25.

The Annual Country Dinner will be held in Harrogate on Thursday, June 23; Viscount Lascelles, K.G., and other prominent Yorkshire representative men have accepted invitations to attend. It would greatly help the Secretary if members desiring to take part in the meeting, or any portion of the programme, would send in their names to him as soon as possible.

THE ARCHITECTURE CLUB.

The following new members have been elected :—Mr. Joseph Armitage, Mr. W. Aumonier, Mr. P. G. Bentham, Mr. Alan Clutton-Brock, Mr. Philip Connard, Mr. John Gloag, Mr. Victor Gollancz, General Sir Aylmer Haldane, Mr. E. Stanley Hall, Mr. H. de C. Hastings, Mr. William Haywood, the Rev. J. L. Fisher, Mr. Basil Ionides, Mr. C. Pughe Morgan, Mr. Basil Oliver, Mr. D. Godolphin Osborne, Mr. W. J. Palmer Jones, Prince George of Russia, Mr. Michael Sadleir, Mr. L. Sylvester Sullivan, Mr. Arthur Towle, Mr. Laurence A. Turner, Sir E. Owen Williams, and Mr. Edmund Wimperis.

Mr. James Bone, after five years' service, has retired from the executive committee, becoming a member of the council, and also remaining chairman of the press committee. The vacancy on the executive thus created has been filled by the election of Mr. A. S. le Maitre. Mr. Nathaniel Lloyd, the other member of the executive retiring under Rule VII was re-elected at the annual general meeting.

The next dinner of the Club will be held at the Savoy Hotel on Tuesday, July 12, 1927.

A club visit has been arranged for Wednesday, June 29, 1927, at 2.30 p.m., to the Second Church of Christ Scientist, Palace Gardens Terrace, Kensington, W. 8 (Sir John Burnet, R.A., and Partners, architects), and at 4 p.m. to the Eleventh Church of Christ Scientist, Nutford-place, Edgware-road, W.1 (Mr. Oswald P. Milne, architect).

Mr. Guy Dawber.

Mr. E. Guy Dawber, A.R.A., P.R.I.B.A., is confined to the house by illness, and will probably be unable to keep his public engagements during the next two or three weeks.

Amusement Centre : Thames Ditton.

A contract has been signed, so it is understood, for the purchase of riverside land at Thames Ditton, which it is proposed to convert into a miniature Venice. Colonel Harry Day, M.P., is at the head of the syndicate which is promoting the scheme, and it is proposed to spend £500,000 on a great all-the-year round amusement centre. In the centre there will be a hotel with 200 bedrooms and a big ballroom. An amusement park will be laid out on the lines of Coney Island, New York. The hotel and ground, it is expected, will be ready by the summer of 1929.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XXII

BY H. V. MILNES EMERSON, A.R.I.B.A.

SECTIONS 75, 76 and 77 (Continued).

18. (1) Buildings shall not, without the consent of the Council, be united unless :

(*a*) They are wholly in one occupation, and

(*b*) When so united and considered as one building they would be in conformity with the principal Act as amended by this part of this Act and with this part of this Act.

(2) An opening shall not be made in any division wall separating divisions of a building of the warehouse class or used for any trade or manufacture, or in any party wall, or in two external walls separating buildings in any case in which such divisions or buildings as the case may be if taken together would extend to more than 250,000 cubic ft., excepting for the following conditions :—

(*a*) Such openings shall have the floor jambs and head formed of brick, stone, iron or other incombustible materials, and be closed by two wrought-iron doors, sliding doors or shutters, each not less than ¾ in. thick in the panel at a distance from each other of the full thickness of the wall, fitted to grooved or rebated iron frames without woodwork of any kind, and all such doors, sliding doors and shutters shall be fitted with sufficient and proper bolts or other fastenings, and be capable of being opened from either side, and shall have on each face thereof styles and rails at least 4 in. wide and ¼ in. thick, and shall be constructed, fitted and maintained in an efficient condition.

Provided that in lieu of being constructed and fitted as aforesaid, such doors, sliding doors and shutters may be constructed of any such fire-resisting materials, and be fitted in any such manner as may be approved by the Council.

(*b*) Such opening shall not exceed in width 7 ft., or in height 8 ft., and the width of such opening in any wall of a story, or if there be more than one such opening in any such wall, the width of all such openings taken together shall not exceed one half of the length of such wall.

Provided that any such opening may be 9 ft. 6 in. in height in a wall of which the thickness is not less than 24 in., or if the doors, sliding doors or shutters closing such opening are placed at a distance of not less than 24 in. from each other.

Provided also that the Council may consent to any such opening being of such greater height or width as they may think fit.

(3) Whenever any buildings which have been united cease to be in one occupation the owner thereof, or if the buildings are the property of different owners, then each of such owners shall forthwith give notice of such change of occupation to the District Surveyor, and shall cause all openings uniting the same in any party wall or in any external wall to be stopped up (unless the Council consent to such openings or any of them being retained) with brick or stone work not less than 13 in. in thickness (except in the case of a wall 8½ in. in thickness, in which case 8½ in. shall be sufficient) and properly bonded with such wall, and any timber placed in the wall and not in conformity with the principal Act shall be removed.

And if notice be not given to the District Surveyor pursuant to this section, such owner or each of such owners shall, upon conviction in a summary manner, be liable to a penalty not exceeding five pounds.

(4) Buildings shall be deemed to be united when any opening is made in the party wall or the external walls separating such buildings, or when such buildings are so connected that there is access from one building to the other without passing into the open air.

(5) The provisions to this section shall extend and apply (a) to all openings at any time after the passing of this Act made or proposed to be made in any party wall or two external walls or in any division wall, notwithstanding the existence in any such wall of an opening uniting buildings or affording communication between divisions of a building (as the case may be); and (b) to such buildings as if they had not previously been united.

Note.—Under the old Act it was held that the provision for uniting buildings applied only to buildings which had been completely erected as separate buildings, and did not apply to buildings in course of erection. In this case several blocks of flats were originally intended to be erected as distinct buildings, but were subsequently connected before completion, and it was held that this constituted one building and not the uniting of several buildings. Goodchild v. Matthews, 89 L.T. 369 (1903).

With regard to the conditions in sub-section 2, there are several varieties of fire-resisting doors in use, including the ordinary steel door, wood and armoured doors, and steel revolving shutters. Although the general width of an opening is 7 ft., consent has been given to openings up to 12 ft. in width. Window openings are permissible in division walls (Drury v. Army and Navy Auxiliary Co.), but this decision is not applicable to party walls between different owners, although in a building recently erected the District Surveyor has allowed such window openings in a party wall. Section 101 of the Act allows the reconstruction of certain previously existing windows in party walls. Under sub-section 3 the opening uniting buildings under one occupation must be closed upon the termination of such occupation, but it does not provide for closing window openings in the division wall which would revert to a party wall, and sub-section (a) which defines the uniting of buildings, states that a building is united when access can be made from one building to another without passing into the open air.

Sub-section 5 was inserted to counteract the decision that an opening in a party wall, made without authority or knowledge of the district surveyor between buildings not wholly in one occupation were already united, and the formation of another opening in such party wall did not unite the buildings as they were in fact already united. Woodthorp v. Spencer, 63 J.P., 246. (1899).

Section 19.—The provisions of the principal Act with respect to party walls shall extend and apply to such division walls as are referred to in this part of this Act.

Provided that in the case of any division wall the Council may, if they think fit, consent to such departure as they may consider expedient from such of the said provisions as are contained in Part VI. of and the First Schedule of the principal Act.

Note.—The provisions with respect to party wall will be found in Sections 54, 56, 59, 60, 208 and 209 of the principal Act. In the construction of division walls all or any of the requirements from sections 53 to 81 inclusive, forming Part VI. of the Act, together with the First Schedule, which specifies the materials accepted as fire-resisting can be replaced with more up-to-date methods of construction and materials if the Council consent.

Section 20.—A copy of any plans and particulars approved by the Council under this part of this Act shall be furnished by the Council to the district surveyor within whose district the building to which such plans and particulars relate is situate.

Note.—It would appear that the Council and not the applicant must provide the plans, etc., required for the district surveyor.

Section 21.—Any person failing to comply with any term or condition imposed by the Council in giving any consent under this part of this Act or failing to maintain in an efficient condition any doors, sliding doors, shutters, styles, or rails or bolts or other fastenings as required under this part of this Act shall be liable to a penalty not exceeding 20 pounds and a daily penalty not exceeding the like amount.

Note.—Section 190 of the Principal Act gives the Council power to impose conditions, and section 200 is the general penalty clause.

Section 22.—This section exempts Government buildings, etc., and completes the revised sections for the repealed sections 75, 76 and 77.

Section 78.—Notwithstanding anything in this Act every public building, including the walls, roofs, floors, galleries and staircases and every structure and work constructed or done in connection with or for the purpose of the same shall be constructed in such manner as may be approved by the District Surveyor, or in the event of disagreement may be determined by the Tribunal of Appeal, and save so far as respects the rules of construction every public building shall throughout this Act be deemed to be included in the term building and be subject to all the provisions of this Act in the same manner as if it were a building erected for a purpose other than a public purpose.

No public building shall be used as such until the District Surveyor or the Tribunal of Appeal shall have declared his or their approval of the construction thereof.

After the District Surveyor shall have so declared his approval or shall certify that it has been constructed as directed by the Tribunal of Appeal, any work affecting or likely to affect the building shall not be done to in or on the building without the approval of the District Surveyor or such certificate as aforesaid.

Section 79.—Conversion of houses, etc., into public buildings.

Where it is proposed to convert or alter any building erected for a purpose other than a public purpose into a public building, such conversion or alteration shall be carried into effect and the public building thereby formed, including the walls, roofs, floors, galleries and staircases thereof shall be constructed in such manner as may be approved by the District Surveyor or in the event of disagreement may be determined by the Tribunal of Appeal and the provisions of this Act shall apply to such alteration or conversion as though it were the construction of a public building.

American Cement.

Net earnings of American cement companies have consistently increased since the war, according to "The Index" (published by the New York Trust Company) from which we quote the following:—"The encouraging feature of the past year in the cement industry was the fact that while production increased 1.4 per cent., consumption increased 2.8 per cent. Both figures established new records: For production, 164,057,000 barrels, and for shipments, 161,781,000 barrels. The industry's problem in the past few years has been to find an adequate market for its steadily expanding capacity. Imports from abroad have also greatly increased, rising from 122,000 tons in 1921 to over 3,000,000 in 1926. Of the total American imports, 84 per cent. comes from Belgium, but the stabilisation of the Belgian franc will probably result in a gradual rise of manufacturing costs, which will in turn militate against the maintenance of this Belgian export trade. The current situation is satisfactory. As usual, stocks on hand at the end of February were very large, amounting to 23,556,000 barrels as compared with 23,236,000 barrels at the end of February, 1926. February shipments, however, increased 16 per cent. over February a year ago, while production was 5 per cent. less."

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Pointing Brickwork.

Sir,—I notice that in a number of modern buildings, the brick joints are simply struck off flush, and apparently with no pressure. The effect is undoubtedly a vastly improved texture in appearance, but whether the wall so treated is as resistant to driving weather as one in which the joints are weathered with a struck joint effected under hand pressure is another matter. I should be glad to hear from those who have used this class of work, what their experience has been, and also the effect of frost on the same.

DOUBTFUL.

Levelling.

Sir,—In taking off quantities for levelling the site of a tennis court where the existing surface is a regular slope, is it correct to measure the digging at per yard cube, including wheeling and depositing on the lower part of the site, and then to measure in yards super over the whole site, for spreading to true level surface?

WORKS.

Road Charges.

Sir,—Where a new road is laid alongside the site of an existing house, *i.e.*, along its side frontage, what is the usual method of apportioning the road charges to this site? Is there any depth of this site where no charge can be made, and is it common to charge the remainder of the frontage at a reduced rate?

HOUSEHOLDER.

Rubbers.

Sir,—One sees very little rubbed and gauged work about nowadays, and it is possible that this class of brick is now little manufactured. Can you inform me if that is the case, and if not what is the present market price of rubbers, delivered at London railhead?

GEORGIAN.

Thickness of Walls in One-Story Buildings.

Sir,—What are the laws governing the thickness of brick walls in one-story buildings, as regards length? For example, a stores, 100 ft. long, 24 ft. wide, and 12 ft. high, with lean-to roof, is shown with 9 in. walls, with 14 in. thick piers 2.3 ft. wide, spaced every 12 ft. to front elevation, where windows occur. The back elevation has 14 in. thick piers, 18 in. wide, spaced every 12 ft. The end elevations are 9 in. solid walls. Is this a sufficient thickness?

ESTIMATOR.

Unstable House and Building Society.

[REPLY TO "READER," JUNE 10.]

SIR,—I was recently told by a bank manager that his bank was becoming increasingly disturbed at the poor security for loan afforded by much of the cheaper-class of new houses erected, and that they were urging the employment of a qualified architect for the design and supervision of such buildings for which assistance was required. It would be interesting to hear from Building Societies whether the architect-designed house is valued as a better security than others by this class of institution. The matter is of interest, not only to the profession, but to the public.

ARCHITECT.

Surveying Fees.

SIR,—Can you tell me what basis should be adopted for arriving at fees due for surveying old property (buildings)? There appears to be no fixed scale mentioned in the R.I.B.A. scale of charges.

MEASURING UP.

BOOK REVIEWS

The Law of Building and Engineering Contracts and of the Duties and Liabilities of Engineers, Architects, Surveyors, and Valuers. By A. A. HUDSON, of the Inner Temple and Western Circuit; one of His Majesty's Counsel. Assisted by LAWRENCE MEAD, B.A., of the Middle Temple and the Oxford Circuit, Barrister-at-Law. Fifth Edition. (London: Sweet & Maxwell, Ltd., 1926.) £3 3s. net.

All those interested in the law relating to building and engineering contracts will welcome a new edition of this standard work, the last edition having appeared in 1914, the year of the outbreak of the War, which dislocated all ordinary matters of daily life, including the publication of law works. This fifth edition consists of a single volume, as the author states in his preface it has not been considered necessary either to revise or reprint the second volume of the fourth edition, which contains reports of cases and precedents and forms, but we may mention for the benefit of those who do not already possess this second volume of the fourth edition that in a publishers' note at the end of the preface it is stated copies are still available for sale with the present new edition.

The author states that the present volume has been greatly revised, and is intended to be improved by a better classification of the various subjects; by subdivision into twenty-one chapters in place of sixteen, and by a fuller consideration of the duties of architects and engineers in giving certificates, of the effect of arbitration clauses, of cases where quantities are made part of the contract; of the liability of the building owner for payments of sub-contractors, etc. The bulk of the volume has rather been diminished than increased, despite the new matter, by the omission of American and Colonial cases wherever they are covered by English authorities, and, as the author puts it, by the elimination of a certain amount of extraneous matter, and we believe it will be found that he has included in this latter head a chapter which appeared in one of the former editions on the "Liability of Owners for Nuisance and Negligence," a subject certainly outside the law of contracts.

When we have stated in what particulars the new edition of a standard work of this description, and with the reputation it has acquired, differs from its predecessors our task seems really completed and little else can be called for. The main features of the work remain the same, statements in the text illustrated by examples of cases, and this, no doubt, is a convenient form, as it enables the reader to ascertain with small trouble all the decided cases on the points indicated in the text, but we have sometimes felt that the value of this work to those who are not skilled lawyers would be enhanced if the authors, with their great experience, would summarise their own views tersely as to conflict between the decisions given in the illustrations. An example of what we mean is afforded in the sections of the work dealing with such subjects as "Indispensably necessary works in a contract for a lump sum—where quantities made part of contract," and again in the section dealing with "Nomination of specialists by building owner," a section which embraces the difficult questions involved by the different views expressed in Crittall Manufacturing Co. *v.* London County Council, Younge *v.* White, and Hampton *v.* Glamorgan County Council; the matter is all there, and commented upon for the benefit of the skilled lawyer, but a summary of these comments, showing the general effect of all the decisions and the best method of avoiding pitfalls, would, we think, be welcomed by those not highly versed in the law, such as architects and others. This is a work intended for lawyers, so we are aware our suggestion may appear wide of the mark, but the work is so valuable that we cannot but feel that it would appeal to even a wider public were it possible, where there is great conflict in the decisions given as illustrations, if the authors could provide the simple key we suggest for those concerned with building and engineering contracts but who are not skilled lawyers.

This volume appears to us even an improvement on former editions, and it is certain to be warmly welcomed by all concerned with the branches of the law with which it deals, and it will form an essential addition to the technical library. It is hardly necessary to say that the work appears carefully done, and if we refer to one printer's error we think we have discovered, it is only because it may save others the little difficulty we experienced. We think at page 3, under the heading (*b*) "As to drawings," and the paragraph which states that an architect has no authority to warrant to the builder that drawings are correct, the reference to "section 5" is a reference to section 15, where at page 38 the question of warranty is dealt with.

Rusticus, or the Future of the Countryside. By Martin S. Briggs, F.R.I.B.A. 94 pp. London (Kegan Paul.) 2s. 6d. net.

This is one of the latest additions to the "To-day and To-morrow" series of interesting little books on the arts, crafts, science and sociological questions of the day. The author has no false love for the antique for its mere antiquity, and no hatred of progress for its modernity; and in the limitations of his 94 pages he gives us a graphic picture of what the countryside was yesterday—before the railways came—what it is to-day, with the advent of the motor-car, and what it may be to-morrow under systems of intelligent town-planning of newer districts added to a wise conservation of anything beautiful and desirable in our old buildings. The railways had to come, and the petrol-driven car and the arterial road. We are all for progress, but we must try to understand what that means. If the railways shocked the æstheticism of Ruskin, what would he have said of the hurly-burly of petrol-driven road traffic and the sprawl of hideous shacks of bungalows which disfigure some of our main roads and cliff edges? In less than twenty years King Petrol has done more in certain directions to disfigure the countryside than King Coal did in a century. The disfiguring influence of coal was seen more in the factory and blast furnace than in the railway; one can, or could, till recently, get away from a railway track into perfect peace within the space of a few minutes' walk, but the motor-car, like the belching chimney, is ubiquitous: and so long as people will joy-ride from place to place, caring little or nothing for the beauties betwixt and between, the arterial road is the natural and only solution, and not, of necessity, should it make for the "uglification" of the country; as an institution it is in its babyhood and, as the author of this excellent little work suggests, with proper foresight and due care it may indeed become a thing of real beauty.

As to the preservation of time-honoured buildings up and down and across the countryside, we do not always realise the powers we have under various Acts and Royal Commissions, nor do we always remember the various preservation and abatement of nuisance societies whose activities are at our beck and call. The author gives the names and addresses of these societies in an appendix. The will to do is nine-tenths of the battle; and if we really have the danger to our heritage at heart and recognise how much of the blundering of the past may be remedied, it is quite possible, as the author says in his final paragraph, that "with more of brains and less of greed, more of public spirit and less of vested interests, rural England may yet be saved." There is no reason why bungalows—"homes for heroes"—should be hideous, and less reason why we should not catch trout under the walls of Kirkstall Abbey when, as we have been promised, the waters of Aire and Calder run as clear as the springs of Wandle. Mr. Briggs, as "Rusticus," with his pregnant suggestions, will help us to think these matters out; and, like the "Rusticus" of Horace, we must not stand too long while the river flows by.

THE BUILDING TRADE

THE LAW OF FIXTURES.—VIII

By W. T. CRESWELL, Barrister-at-Law; L.R.I.B.A.; Associate (late Fellow) of the Surveyors' Institution; &c.

ECCLESIASTICAL FIXTURES.

Case Law.

The tenancy of an incumbent of a living may be regarded, for all practical purposes, as equivalent to that of a tenant for life; except that no reversioner exists having any present rights or interests in the benefice. Hence rules which control fixtures in the case of a tenant for life apply to ecclesiastical fixtures of the benefice, although questions as to right of removal are, if anything, more in favour of the incumbent, and mainly arise only in respect to articles of ornament or convenience erected by the present incumbent in the parsonage-house, etc.

In general, all Case Law shows that the right of removal is in favour of the executors of the last incumbent, as to articles fixed by himself during his incumbency and for his own convenience; although articles fixed by a yet previous incumbent remain as being "in the nature of heirlooms," and are irremovable.

Where, however, a bishopric is concerned, the ornaments of the bishop's chapel do not pass to the executors of the last bishop, but to the succeeding bishop, since they are considered as fixed to the realty, and in the nature of heirlooms. (See Bishop of Carlisle's Case, *Year Book* 21, Edw. III., p. 48, and Corvens Case, 1612, 12 Co. Rep. 105.)

The burden of expense in maintaining any needless luxury or ornament in which the present incumbent has indulged must not be transmitted to his successors, and the executors of a deceased rector have been held entitled to remove hothouses, wooden frames, and glasswork bedded in mortar on low brick walls, if doing no damage thereto (except that necessarily done to the mortar only) in the removal, within a reasonable time after the death of the testator. (See Martin *v.* Roe, 1857, 7 E. & B. 237.)

Further, it seems that the incumbent, or his personal representative, has a reasonable time, from the avoidance of the living or the decease of the incumbent, in which to remove fixtures. But if the incumbent resigns the living, it appears he cannot then remove anything attached to the freehold, on the same principle that he is not, in such a case, entitled to emblements, *i.e.*, fruits of the earth produced by labour and manurance. (See Bulwer *v.* Bulwer, 1819, 2 B. and Ald. 470.)

In Huntley *v.* Russell (1849), 13 Q.B. 572, an incumbent brought an action against the executors of his predecessor because a cottage, a barn, and a lean-to, all of which rested on the ground or on bay stones, had been removed. It was held that the executors were not liable for damages, and that they had a right of removal of the buildings, inasmuch as they had not been fixed to the freehold.

Statute Law.

Under Sections 9 and 10 of the Ecclesiastical Houses of Residence Act, 1842, pictures, books, or other goods and chattels in any residence-house sold or taken down, may be sold or removed to a new residence-house; and provision is also made for fixtures, fittings and other articles being catalogued and made part of the freehold and irremovable.

The corporation established in 1704, and known as "The Governors of the Bounty of Queen Anne, for the Augmentation of the Poor Clergy," have power, in the case of the net annual value of a benefice not exceeding £200, to make a grant for the acquisition for the benefice of such movable fixtures in the parsonage-house and premises as should, in their opinion, belong to it, and when such fixtures are the personal property of the incumbent or his representative. A detailed list and valuation is made of them by the diocesan surveyor, at the cost of the incumbent applying for the grant, and the governors may include one-half of the surveyor's charges in the grant. When these fixtures are thus acquired, they become, and are part of, the property of the benefice, and liable to a claim for dilapidations under the Ecclesiastical Dilapidations Measure, 1923.

The Ecclesiastical Dilapidations Measure, 1923.

This Measure set up a "Diocesan Dilapidations Board," which, when referred to in connection with a particular benefice, means the Board for the area in which such benefice is situated.

Under Section 46 of the Measure, the surveyor, acting under the Measure for the area concerned, may report to the Board that a building belonging to the benefice is superfluous; also the incumbent may make a like representation; and the Board may in its discretion and with the consent of the patron and incumbent, order the removal of such building, and the sale of its materials.

Under Section 48 it is not lawful for an incumbent to make any addition to, or alteration of, buildings belonging to a benefice without the sanction of the Board and the consent in writing of the patron.

Under Section 49 the surveyor under the Measure, if at any time required by the Board, is to make a report upon the fixtures and things which are in or about any buildings belonging to the benefice, including a complete schedule or inventory of all such fixtures and things. A copy of the report, etc., is sent to the present incumbent or his executors or administrators, or, if the benefice be vacant, then the preceding incumbent or his executors or administrators; and any person to whom it is sent may, in writing, to the Board, object to the report on any ground of fact or law referring to their ownership. The Board considers the report and objections and forwards it (with its conclusions either concurring with or varying the report as it thinks fit) to the Central Authority under the Act, viz., Queen Anne's Bounty, and that authority may then make an order confirming the conclusions of the Board with such variations, if any, as the Authority may determine. This order is binding on the incumbent of the benefice, and any other person concerned in respect to the ownership of the articles. But there is also provided the right of appeal (under rules framed by the Lord Chancellor after consultation with the Central Authority) to the County Court on any ground of fact or law relating to the ownership of the fixtures and things, and from the County Court to the High Court of Justice.

The costs of defending any such appeal by the Board, and all expenses incurred by the Board in connection with such appeal, may, under the Measure, be defrayed by the Board as administrative expenses out of the moneys applicable for such expenses, as determined under Section 24 of the Measure, *i.e.*, the annual payment made under the Ordinary Assessment fixed by the Central Authority and called the Administrative Rate.

British School of Archæology in Egypt.

The annual exhibition of this School will be held from June 27 to July 16 at University College, Gower-street. It will consist of antiquities from the City of Gerar, Egypt over the border, found by Professor Sir Flinders Petrie and students. Admission is free, without ticket. The exhibition is open from 10 to 5 p.m. and from 6.30 to 8.30 p.m. on July 6 and 15.

COMPULSORY ACQUISITION OF LAND

In our issue, September 24, 1926, we noted a case, *In re* Northwood and Others *v.* London County Council (1926, 2 K.B. 411) where under an improvement scheme under Part II of the Housing of the Working Classes Act, 1890, land was being acquired compulsorily. The measure of compensation is laid down in section 9, subsection (i), of that Act, which under the consolidating Act of 1925 is section 46, subsection (1).

The compensation is assessed under the Acquisition of Land (Assessment of Compensation) Act, 1919, and under section 6 of that Act the arbitrator may, and shall if the Court so directs, state a special case for the opinion of the Court on any question of law, and the case may be stated at any stage in the proceedings. The arbitrator had stated a case on the following questions:—Whether he was entitled to award the applicant any compensation for trade disturbance or loss of licence on the public-house; any sum for trade fixtures; any greater sum than he otherwise would in respect of the site value of the premises because a part of them was licensed; any sum for trade disturbance or for loss of trade apart from the consideration of the premises being licensed premises, and the Divisional Court had answered all these questions in the negative.

The arbitrator then made his award as follows:—"(1) Site value; the acquiring authority to pay the claimants the sum of £200 as purchase money and compensation in respect of their leasehold interest; (2) other claims as set out in the special case stated by me to the High Court on October 22, 1925, a copy of which, together with copies of the judgment and order of the Court on the points submitted, I append hereto and adopt as my award in respect of the items therein enumerated." The claimants then moved a Divisional Court to set aside this award as being bad on the face of it, but the Court dismissed the motion, and the claimants then appealed to the Court of Appeal.

The claimants relied upon a dictum of Lord Justice Bowen in Knight and Tabernacle Building Society (1892, 2 K.B. 613), and of Lord Haldane in British Westinghouse Co. *v.* Underground Electric Railways (1912, A.C. 673), but the Court of Appeal affirmed the preliminary objection to the appeal on the ground that section 6 of the Acquisition of Land Act, 1919, makes the decision of the High Court final and conclusive at whatever stage in the proceedings for compensation it may be given.

In British Westinghouse Electric and Manufacturing Company *v.* Underground Electric Railways Company of London, Limited (*ubi sup.*), the arbitrator had stated a special case under section 19 of the Arbitration Act, 1889, and the opinion of the Divisional Court had been embodied in the award, but the House of Lords found that the question of law stated in the special case had been wrongly answered, and the case was remitted to the arbitrator, an objection that the award was not open to review inasmuch as it merely embodied an expression of opinion by the Divisional Court which was not susceptible of being the subject of appeal, being overruled. There is, however, no provision in the Arbitration Act corresponding to the express provision contained in section 6, subsection (2), of the Acquisition of Land Act, that the decision of the High Court shall be final and conclusive, although the cases decided under the Arbitration Act (see *In re* Knight and Tabernacle Permanent Building Society) have held there is no appeal, because the matter under a special case comes before the Court for "the opinion" of the Court, and thus there is no determination which amounts to a judgment or order appealable against.

THE REPORT OF THE COMMITTEE ON THE LAW OF ARBITRATION

The Report of the Committee appointed "to consider and report whether any, and if so what, alterations are desirable in the law relating to arbitration, and in particular to submissions, arbitrations and awards made or held in England and Wales, or the law relating to the effect given in England and Wales to submissions and awards made or held elsewhere" is unanimous, and that the alterations in the law suggested are drastic is proved by the fact that the Committee suggest that if any substantial number of their recommendations are adopted the easiest and most satisfactory course would be to repeal the Arbitration Act, 1889, and re-enact it in an amended form rather than merely to amend it. It is difficult to deal with the Report in any connected form, as the Committee themselves recognise that their recommendations touch a variety of matters not much connected one with another, and involving in most cases no common principle. We will try, however, so far as possible to follow the sequence of sections in the Act or the order of the proceedings.

The Constitution of the Tribunal.

Under the Act (paragraph (*a*), Schedule I), if no other mode of reference is provided the reference shall be to a single arbitrator. The Report, however, points out (paragraph 23) that inveterate practice induces people to appoint two arbitrators, one to be appointed by each party, and for an umpire to be appointed by the arbitrators. (This practice is laid down in Schedule I, paragraph (*b*), of the Act.) The Report then states that in a great many submissions, *e.g.*, by the arbitration clause in many insurance policies, it is common to add that the umpire shall sit with the arbitrators from the beginning, and not, as is contemplated in paragraph (*c*) of the Schedule, only assume his functions when the arbitrators fail to agree.

Then follows this passage in the Report: "This system has grave practical results, often in the way of delay, invariably in regard to expense. For arbitrators are only too often selected as partisans or advocates who are not likely to agree and perhaps are not intended to do so. It is sometimes desirable that the arbitrators should sit with the umpire, but we are all of us familiar with the experience (which occasionally happens) that the arbitrators are mere passengers in the boat, who give no real assistance to the umpire, and whose sole reason for attending appears to be to inform the umpire at the conclusion of his labours of the fees which they desire him to include in the award on their behalf. So unsatisfactory and wasteful is this system that we are convinced that its continued and widespread use is mainly due to two causes: (1) The desire of the parties, by the agency of the arbitrators, to procure the appointment as umpire of a competent and impartial person; and (2) the desire to employ the arbitrators as advocates of their respective causes before the umpire." (See paragraphs 23 and 24.)

These appear rather serious charges to make against persons acting as arbitrators, persons exercising judicial functions; but the Committee, to mitigate the evils pointed out in the two paragraphs set out above, made the following recommendations in paragraph 26 of the Report: "(*a*) Where a submission provides for the appointment of two arbitrators who are to appoint the umpire, then it shall be the duty of the arbitrators to appoint the umpire immediately after they themselves are appointed." (At present they can do so at any time within the period during which they have power to make an award. Schedule I, paragraph (*b*), Act, 1889.) "If they fail to do so, either party to the submission may apply to the Court or a judge to appoint an umpire."

"(*b*) At any time after the appointment of the umpire, either party to the submission may apply to the Court or a judge for an order that notwithstanding anything to the contrary in the submission the umpire shall henceforth act as sole arbitrator. If that be ordered the arbitrators shall be discharged, but it shall be competent for them to appear as witnesses or to act as advocates in the arbitration." This appears a somewhat circuitous method of appointing what will amount to a single arbitrator, and a question will arise as to the fees payable to so-called arbitrators whose sole function will be to appoint a so-called umpire. It is obvious a very different fee will be payable to the "arbitrators" in such circumstances than that which would be payable where the arbitrators take upon them the burden of the arbitration. In this connection we may mention that in the same paragraph of the Report (26) it is recommended: "A party to a submission may apply to the Court or a judge" (or in certain circumstances to the District Registrar of the High Court, see paragraph 7 of the Report) "for the taxation of the fees made payable by an award; he may have an order of delivery to him of the award upon paying into Court, to abide taxation, the fees demanded for its delivery; no taxation or reduction of such fees shall be allowed if they are in accordance with any agreement between the arbitrator or umpire and the party applying; and the arbitrator or umpire, taxation of whose fees is thus being applied for, shall be entitled to appear and be heard." The parties must therefore see that they agree to reasonable fees and bear in mind, should this recommendation ever be accepted, that the function of the arbitrators, as arbitrators and not witnesses, will be very different from what they are under the existing practice.

Time Within Which Award Must Be Made.

The next point we may refer to is the time within which an award shall be made. The Committee find (paragraph 5) that the provisions contained in section 2 of the Arbitration Act, 1889, and paragraphs (*c*), (*d*) and (*e*) of the First Schedule, have no practical value at all. We need not set out these paragraphs, as they can be referred to in the Act, but the criticism of the Committee was as follows: "A careful arbitrator, in our experience, at an early stage endorses on the submission an extension of time for an arbitrary period (he can make it a century with complete impunity!) and thus avoids any trouble. On the other hand, if a careless arbitrator forgets to go through this ritual, the only result is that a dissatisfied party has a chance of seeking to set aside an award on the technical ground that it was made out of time. Secondly, there is in the present system, by which the time for making an award is under the control of the arbitrator or arbitrators or umpire, a serious disadvantage. A party to a submission who has no real defence to the claim may, and as we are informed often does, appoint his arbitrator where two are to act, with a request to him that he will delay matters as much as possible, a request which is only too easily complied with."

To secure the prompt hearing of arbitrations and to avoid delay, the Committee recommend that the above three paragraphs of the First Schedule should be repealed and the following provision be enacted in place of them:—

"An arbitrator or arbitrators or an umpire shall proceed with the arbitration, and shall make his or their award, with all reasonable dispatch. If he or they fail to do so, either party to the submission may apply to the Court or a judge for leave to revoke the submission or for an order appointing an arbitrator or umpire in place of one so in default. Any arbitrator or umpire removed from his office pursuant to such an order shall have no claim for any remuneration for any work he may have done."

Interlocutory Proceedings.

The Report points out (paragraph 6) that almost the only proceeding of an interlocutory nature contained in the Arbitration Act is the powers contained in section 18 subsection (1) for the Court or a judge to issue a subpœna to compel a witness to attend before an arbitrator, but the Committee suggest that there are matters in which orders of a Master might properly be made to assist in the conduct of an arbitration as in other litigation, and they recommend that provision should be made whereby a party to a submission may apply to the Court or a judge in the following matters:—

"(*a*) For the examination of a witness or witnesses before a special examiner either in this country or abroad.

"(*b*) For discovery of documents, and interrogatories.

"(*c*) For evidence to be given by affidavit in the same circumstances as in litigation.

"(*d*) For another party to give security of costs in the same way as a litigant.

"(*e*) For the inspection, or interim preservation, or the sale of goods or property the subject matter of the arbitration.

"(*f*) For an interim injunction or similar relief.

"(*g*) For directing an issue by way of interpleader between two parties to a submission and the relief to a third party desiring so to interplead.

"(*h*) For substituted service of notices required by the Act; this should include a provision for the service upon an agent in this country of a party resident abroad—a thing not included in the ordinary machinery of the Courts under name of 'substituted service.' Any such order should specify the time within which such a notice should be complied with, having regard to the course of post to the residence of a foreigner concerned, etc."

It is in the following paragraph of the Report (7) that it is suggested that such applications may be made to the District Registrar where both parties reside or carry on business in the district of that Registrar, or by consent to any district registrar. The proposed extension of "substituted service" in the case of arbitrations we imagine will raise discussion.

Where a Case has to be Stated.

Another important point raised by the Report is in connection with the powers of stating a case for the opinion of the High Court. Under the Arbitration Act by section 7 the arbitrators or umpire, acting under a submission shall, unless the submission expresses a contrary intention, have power to state an award as to the whole or part thereof in the form of a special case for the opinion of the Court, whilst section 19 provides that any referee, arbitrator, or umpire may at any stage of the proceedings, under a reference, and shall, if so directed by the Court or a judge, state in the form of a special case for the opinion of the Court any question of law arising in the course of the reference.

The Report points out (paragraph 8) that under section 7 there is an appeal without leave, but under section 19 there is no appeal from the decision of opinion of the High Court (*In re* Knight *v.* Tabernacle Co., 1892, 2 K.B. 613). It may, however, be noted that although there is no appeal, if the opinion of the High Court is manifestly wrong the award can be set aside on appeal (British Westinghouse Electric and Manufacturing Company *v.* Underground Electric Railways Company of London, 1912, A.C.673, this being a decision by the House of Lords).

(To be continued.)

Engineer's Estate.

Alderman Edward Bremner-Smith, of Bryn Estyn, Oswestry, electrical engineer, left £13,848.

UNIFORMITY OF VALUATION

CENTRAL VALUATION COMMITTEE.

Second Series of Representations.

THE Central Valuation Committee (constituted under section 57 of the Rating and Valuation Act, 1925, to promote national uniformity in valuation for local rates) has made a second series of representations to the Minister of Health, who has circulated them to the local authorities in the form in which he received them. The document containing the new representations may be obtained from H.M. Stationery Office, price 2d. It will be recalled that the Committee's first series of representations was circulated by the Minister last December. With regard to this first series the Committee state that, in their opinion, there is no need to amend the resolutions previously passed. The Committee have recently addressed to the new Assessment Committees a circular letter and questionnaire asking for precise information as to the existing practices in valuing, for purposes of local rates, woodlands, sporting rights, tithe rent-charge, advertising stations, petrol pumps, village halls, elementary and secondary schools, sports grounds, hospitals, clubs, coal mines, and other property.

The new resolutions contain detailed suggestions for the guidance of Rating and Assessment Authorities. Advice is given as to the method of making entries in the new valuation lists in the case of net annual and rateable values, which include fractions of a pound. Where the true gross value of a hereditament is a sum which includes a fraction of a pound, the Committee state that it would be improper, in the present state of the law, to adopt a practice of increasing or reducing that sum to the nearest pound. In connection with hereditaments extending into several rating areas, it is recommended that the valuers acting on behalf of the several Rating Authorities should agree upon a common basis of valuation and apportionment: County Valuation Committees and County Borough Councils are urged to do their utmost to assist in fostering the necessary degree of uniformity in the valuation of these extensive hereditaments. On the subject of sporting rights the Committee, while recognising that the matter is not entirely free from doubt, suggest that, until a High Court decision is obtained, Rating and Assessment Authorities should treat such rights when severed from the occupation of, and reserved to the owner of, agricultural land, as being hereditaments other than agricultural land, and therefore as being not entitled to the 75 per cent relief accorded to agricultural land. In the case of properties let on weekly and monthly tenancies, the important recommendation is made that, where the weekly or monthly rent is taken as the basis in estimating the gross value for rating purposes, no deduction (other than rates, where necessary) should, as a rule, be made from the gross value calculated by multiplying that rent by fifty-two or twelve, as the case may be. Attention is drawn to the special provisions of section 12 (9) of the Increase of Rent and Mortgage Interest (Restrictions) Act, 1920, as applying to the assessment of houses built since April 2, 1919. In assessing farm cottages occupied by agricultural workers who are obliged by the terms of their contracts to reside in the cottages, Authorities are advised that they should not regard as conclusive, for the purposes of the valuation lists, the cash values fixed by County Agricultural Wages Committees in respect of the occupation of farm cottages. The Committee also deal with farms burdened with tithe rent-charge. Whether property damaged by mining subsidence should have a lower gross value than other similar property not so damaged is regarded as a question of fact and degree, and no general rule is laid down. As regards land covered with water and comprised in larger hereditaments, it is recommended that such land should generally be treated as a separate hereditament and entered as a separate item in the valuation lists.

In an Appendix, the Committee reply to various comments which have been made upon their first series of representations. It is pointed out that, in drawing up that series, the Committee were fully alive to the necessity of inspecting properties before they are valued for local rates. In answer to objections that their previous recommendations on the subject of farms would result in inequalities and anomalies in the case of the smaller farms, the Committee state that they never intended that the proportions suggested in their previous resolution should be regarded as hard and fast rules. On the subject of licensed premises the Committee say they know of no rule of law which prevents volume of trade from being taken into account as one of the factors in arriving at the annual value for rating purposes. The view is still maintained that Rating Authorities should be able, with the assistance of efficient officers, to arrive at a fair and reasonable valuation of the greater bulk of the hereditaments in their areas without employing or retaining professional assistance for the purpose. The Committee point out that, under the arrangements contemplated by them, the County Valuer would be appointed primarily as an advisory and co-ordinating officer.

Another Appendix deals with glass-houses used mainly for growing fruit, vegetables or flowers for sale. The opinion is expressed that these either "are" themselves market gardens or "form part of" market gardens, and that, therefore, they must be regarded as "agricultural buildings" entitled to the 75 per cent. relief accorded by the new Act to such buildings.

A further Appendix gives a classification of the parishes in the administrative counties of England and Wales, according to the date of the last general re-valuation for rating purposes. In England the number of parishes in which the last general re-valuation took place before the present century is 2,359, the number of parishes in which the last general re-valuation took place since 1900 but before 1919 is 3,832, and the number of parishes in which the last general re-valuation took place after 1919 is 6,757. The corresponding figures for Wales are 475, 359, and 398 respectively.

SETTLED LAND GRANTS*

This little work deals with a highly technical subject connected with the new Law of Conveyancing, which is fully explained in the first chapter. Legal estates in land are now limited to (1) estates in fee simple absolute, and (2) estates for years absolute, and estates which were known as legal estates for life and in tail can now only be created by way of trust. The tenant for life is interested in the settled land in a dual capacity, for besides the beneficial interest for life he is also the legal owner of the fee or term of years, and thus on his death arrangements have to be made by which the property will devolve to the next estate owner, and to effect this a grant of representation to the deceased tenant for life has to be obtained by his personal representatives. We have only attempted a very bald statement as to this subject, which is fully dealt with by the authors, together with the practice relating to such grants, and with forms and precedents, and the relevant sections of the statutes involved are also included in this volume, together with an index. The official positions occupied by the authors, coupled with the fact that they are joint authors of a leading work on Probate Practice, appears to us a sufficient guarantee of the authority of this work and its accuracy.

* *Settled Land Grants.* By A. FITZGERALD HART, of the Principal Probate Registry, and W. E. WILLAN, of the Estate Duty Office, joint Editors of "Tristram and Coote's Probate Practice." (London: Butterworth & Co. 1927.) 7s. 6d. net.

NEW BUILDINGS IN LONDON

Bow.—SCHOOL.—The London County Council are having a new school erected in Wellington-street, Bow.

Cavendish-square. — EXTENSIONS. — Messrs. F. G. Minter, builders, of Putney, S.W., are carrying out extensions to the Cavendish-square, W.1, branch of the Westminster Bank, Ltd.

Ealing.—SCHOOL.—Plans are being prepared by the Borough Surveyor of the Ealing Town Council for a new school at Greenford. These plans are to be submitted to the Works Sub-committee at their next meeting.

Fleet-street. — EXTENSIONS. — Messrs. Trollope & Colls, Coleman-street, E.C., are the builders for the extension of premises in Fleet-street, E.C., for the *Daily Express*. The steelwork is being carried out by Messrs. Moreland, Hayne & Co., Ltd. Messrs. Herbert O. Ellis & Clarke, 3, Old Queen-street, S.W.1, are the architects.

Hammersmith.—ALMSHOUSES.—The B.C. have let on lease a site at the Wormholt Estate for the erection of almshouses to be known as the Dan Chapman Memorial Home. Building—for which no contract has yet been let—will commence as soon as the requisite funds have been obtained. Mr. Matthew J. Dawson, F.R.I.B.A., 11, New Court, Lincoln's Inn Fields, W.C.2, is the architect.

Piccadilly.—FLATS.—Messrs. Yates and Yates, 12A, Hanover-square, W.1, have just completed negotiations for the disposal of the vacant site in Stratton-street, Piccadilly, which is the remaining portion of the Devonshire House block. The site in question has an area of about 16,000 square feet, and plans have been prepared for the erection of buildings consisting of 105 suites of flats in the upper part, with shops on the ground floor. The new buildings will involve an outlay of approximately £350,000. Messrs. Yates and Yates have also been retained as the agents for the letting of the property when rebuilt. Mr. Horace Gilbert, F.R.I.B.A., 43, Finsbury-square, E.C.2, is the architect, and Messrs. Rice and Son, of Stockwell, S.W., are the builders.

Poplar.—HOME.—The Poplar Board of Guardians are about to accept a tender for the erection of a nurses' home and mortuary at St. Andrew's Hospital, Devons-road, Bow, E.3. The tender which is under consideration is that of Messrs. R. A. Reader, of Hackney. Plans for the work have been prepared by Mr. Harley Heckford, Borough Engineer and Surveyor to the Poplar Borough Council. The amount of the tender is £34,686 10s.

Streatham-hill. — THEATRE. — Messrs. Rice and Son have started on the demolition of Nos. 68 and 70, Streatham-hill, for the erection of a theatre, super-cinema, dance hall, restaurant and modern shops with flats. The estimated cost of building and equipping of the theatre, apart from the ground, is £85,000. Messrs. Trehearne & Norman, of Windsor House, Kingsway, W.C.2, are the architects for the work. The building work is also being carried out by Messrs. Rice & Son, of Stockwell.

West Ham.—EXTENSIONS.—The West Ham Board of Guardians have provisionally accepted the tender of Messrs. J. and J. Dean, of Knotts Green-road, Leyton, for the erection of a new dining hall, bakery and workshops at the West Ham Central Home. Mr. G. A. Allen, F.R.I.B.A., 1, Staple Inn, W.C.1, architect.

Travelling Exhibit of Radiators.

The National Radiator Company's travelling exhibit fitted with a working installation of the "Ideal" Cookanheat and "Ideal" Classic Radiators will demonstrate during the ensuing week as follows:—June 17th (aft.) to 20th, adjoining Blue Horse Hotel, London-road (near cricket ground entrance), Grantham; June 22 to 24, Lincolnshire Agricultural Show, Spalding (Stand No. 24).

RATES OF WAGES IN THE BUILDING TRADE

[Every endeavour is made to ensure accuracy, but we cannot be responsible for errors.]

	Masons	Brick-layers.	Car-penters Joiners	Plas-terers.	Slaters.	Plum-bers.	Pain-ters.	Lab-ourer.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

BRISTOL HOUSING CONFERENCE

A CONFERENCE of representatives of local authorities in Gloucestershire, Somerset, and Wilts was held recently at the Council House, Bristol. Alderman F. Sheppard, chairman of the Bristol Housing Committee, presided.

Mr. J. G. Martin, Secretary of the National Housing and Town Planning Council, presented a statement on the present housing position.

After a discussion on the question of the subsidy, during which arguments were put forward for an investigation regarding the cost of building material and in favour of making it possible for local authorities to have more direct dealings with the factors of particular articles, the following resolution was passed:—"That this Conference urges the National Housing and Town-Planning Council to make the strongest possible representations to His Majesty's Government with a view to obtaining the cancellation of the Housing Acts (Revision of Contributions) Order, 1926, so that the present housing subsidies may be continued until the date of the next statutory review."

It was also resolved that the Government be asked for special consideration in the matter of subsidies for houses approved by the Ministry before October, 1926, providing they are completed by March 31 next.

With regard to rural housing, in connection with which it was stated that not much had been done, as only 10,000 houses had been built in agricultural parishes in England and Wales, it was urged that the local authorities should be allowed to administer the Housing (Rural Workers) Act instead of the County Council.

The Conference passed a resolution in favour of power being granted to rural district councils to administer the Act in all cases where application had been made within the statutory period. The question of town-planning then came up for consideration, and after discussion a resolution was passed: "That this Conference recommend that the Town-Planning Act should be amended so that County Councils may be enabled to become constituent members of joint town-planning committees, and as responsible authorities, to co-operate in town planning schemes." The Conference also recommended that where a conference of local authorities has defined an area, and a joint town-planning committee has been constituted, and the majority of local authorities within the area have joined, then if in the area at least three-quarters in rateable value have agreed, the Minister of Health should be empowered to require the minority to join in the preparation of a joint town-planning scheme, in conformity with the wishes of the majority.

LAW REPORT

SHED USED AS DWELLING HOUSE.

Joseph Fitzwilliam Snow, builder, was summoned recently at Bideford police court under the Public Health Acts, by the Northam Urban Council, for having deposited plans for a building at Westward Ho! described otherwise than as a dwelling house, and permitting it to be used for the purposes of habitation. He entered a plea of not guilty. The prosecution stated that plans relating to the building were passed by the Northam Council on April 28, with a certain proviso. The surveyor saw nothing in the plans contrary to the law, the building being there described merely as a temporary shelter or shed. Later it was reported to the sanitary inspector that defendant was using the building as a dwelling-house, and he was found to be in occupation of it with his family.

Defendant told the magistrates that when he presented the plans he had no intention of living in the shed, but delay occurred in the completion of his negotiations for another house, and, as he had sold his own, he had nowhere to go.

The magistrates imposed a fine of £1.

PROPOSED NEW BUILDINGS & OTHER WORKS*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County-Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

TRADE NEWS

"New China Works at Erith."

We referred, under this heading, in our issue of June 3, to Messrs. Doulton and Co.'s, Ltd., new factory for stoneware pipes. Messrs. Doulton wish to make clear that only stoneware drain pipes are to be manufactured at Erith, their china and earthenware products still being made at their works in North Staffordshire.

Woodworking Machinery.

A catalogue that is likely to prove of value to those interested in woodworking machinery of all descriptions is that recently issued by Messrs. A. Ransome & Co., Ltd., Sawmill Engineers and Ironfounders, of Stanley Works, Newark-on-Trent. While this catalogue (S. 26) is not intended to cover all their products in this class of machinery, the machines illustrated cover the general requirements of sawing and planing mills, contractors, builders, joiners, and cabinet makers. This catalogue will be sent upon request to the firm.

Builders' Materials and Ironmongery.

Messrs. Young & Marten, Ltd., have issued a handily sized reference catalogue of every modern appliance required in building construction, decoration, and sanitary engineering. The catalogue, which is indexed, is well illustrated, and contains details of many and varied selections from stock which can be supplied immediately upon application. The catalogue will be sent to all interested upon request to the firm, at Stratford, E.15.

Open Drum Mixers.

A new brochure (M. 6) has been issued by Winget (1924), Ltd., Grosvenor-gardens, S.W.1, dealing with their "Winget" Open Drum Mixer, which is fitted with the Burn Lancaster special drum. Some prominent users of this type of mixer are the Crown Agents for the Colonies; Messrs. Wm. Shepherd & Sons, Ltd., of Wolverhampton; The Limmer and Trinidad Lake Asphalt Co., Ltd., London; and the Corporations of Birmingham, Worthing, and Portsmouth. The catalogue, which gives full details, illustrations, and specifications of the various types of machine, is obtainable upon request to the manufacturers.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Aberdeen.—Houses.—The following plans have been recommended for approval by the Plans and Sewerage Committee of the Town Council:—56 two-apartment houses; three shops in Clifton-road, for Mr. J. Shirras, jun., builder; pavilion in connection with bowling green, etc., on the west side of Pitstruan-place, for the Town Council; hall on the north side of Victoria-road, for the Christian Brethren; 832 houses (720 at Hilton and 112 at Cattofield), for the Town Council.

Broughty Ferry. — Improvement. — The Works Committee of Dundee Town Council has proposed improvements to Broughty Ferry-road, costing £50,000. It was decided that the Committee should visit the road.

Buckie.—Houses.—The following plans have been passed:—New street at Linn-crescent; and 24 houses for the Town Council.

Dundee.—School.—The foundation stone of Balgay Central School, Blackness-road, has been laid by Mr W. S. Nicoll, chairman of Dundee Education Authority, for whom the school is being erected.

Edinburgh.—Building.—The Dean of Guild Court has approved the following plans:—City—reconstruction of purifier house at Granton Gasworks; electric sub-station at Trinity-road; sub-station at Lanark-road, Juniper Green; and demolition of part of workshop at Portobello Electricity Station; Mr. J. Duff—four shops, 6 houses, and 6 garages at corner of Saughtonhall-avenue and Drive; Mrs. Ann Thain—four shops and 2 houses at St. John's-road, Corstorphine.

Hawick.—Houses.—The Town Council has resolved to proceed with the second instalment of the housing scheme at Shorterdykes, consisting of eight blocks of two-room houses, and six blocks of three-room houses. The estimated cost is £19,757, and the building contractors are Messrs. Oliver & Pennycook.

Irvine.—School.—The Dean of Guild Court has sanctioned plans of a new school to be erected by Ayrshire Education Authority on the west side of Kilwinning-road. The new school, which will be called St. Mary's R.C. School, is to have accommodation for 300 children, and is estimated to cost £8,000.

Kirkintilloch.—School.—The Dean of Guild Court has passed plans for the erection of a new school in a portion of the playground of the Townhead School. The new building is to contain gymnasium, two science rooms, and a domestic science section, and the estimated cost is about £11,000.

North Berwick.—Houses.—Operations have been started on the erection of 24 additional houses on land to the south of the present scheme.

Renfrewshire. — Widening. — The Upper District of Renfrewshire on Road Widenings have approved the plan showing the proposed widening of Eastwood Mains-road from Eastwood Toll, Giffnock, to Speirsbridge, Thornliebank, and estimates of the cost, including contingencies and compensation for land, drainages, etc., amount to £36,632.

Obituary.

The death has occurred, at Hamilton, of Mr. W. S. S. Dalziel, joiner and contractor.

The death has also occurred of Mr. A. Davies, contractor, of 91, Cotton-street, Castle-Douglas. Mr. Davies was 56 years of age.

The Seaforth Highlanders' Memorial.

The memorial of the Seaforth Highlanders was unveiled recently at Fampoux, near Arras. The Seaforth Highlanders were represented in various divisions, and every battalion of the regiment fought at one time or another within sight of the hill side above Fampoux, where the Celtic cross which forms the monument has been erected. This cross commemorates 8,432 officers and men of the regiment who fell in the Great War. It stands in a stone enclosure about 30 yards square, just above a sunken road, and is surrounded now on all sides by waving cornfields.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers. +	Carpenters, Joiners.	Plasterers.	Slaters.	bers.	Painters.	Labourers—Masons', Bricklayers', Plasterers'.

*Williams & Watson, Liverpool 173

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A Copy will be sent by return, and your Remittance refunded if the Book does : : not satisfy your requirements : :

B. T. BATSFORD, LTD.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXXII. No. 4403. JUNE 24, 1927.

QUALIFYING EXAMINATIONS

IN the debate on the Registration Bill, in the House of Commons, on April 8 last, Mr. Tasker quoted a number of questions chosen at random from recent R.I.B.A. examinations, and on the score of their apparently obscure application to immediate practical needs, asserted that "if that is what is obtaining to-day under the Royal Institute of British Architects, he did not think they should confer any more power on them." It stands a challenge not only to our examination system, but to the entire fabric of our system of architectural education, out of which we are turning the architects of the future. As such it must be taken up at once, in defence more of these than of the Registration Bill itself, which is now before the Select Committee of the House of Commons.

Allowing a little for debating practice, it is still clear that Mr. Tasker represents a number of those who entertain a sincere doubt as to the necessity of academic study for those training to become efficient modern architects; and as to whether time so spent is not actually valuable time lost upon more profitable branches of study. At some time or other we all have probably entertained a similar doubt, and it is clear that to the layman, the immediate application of the fruits of academic training to the practical problems of modern architecture is doubly obscure.

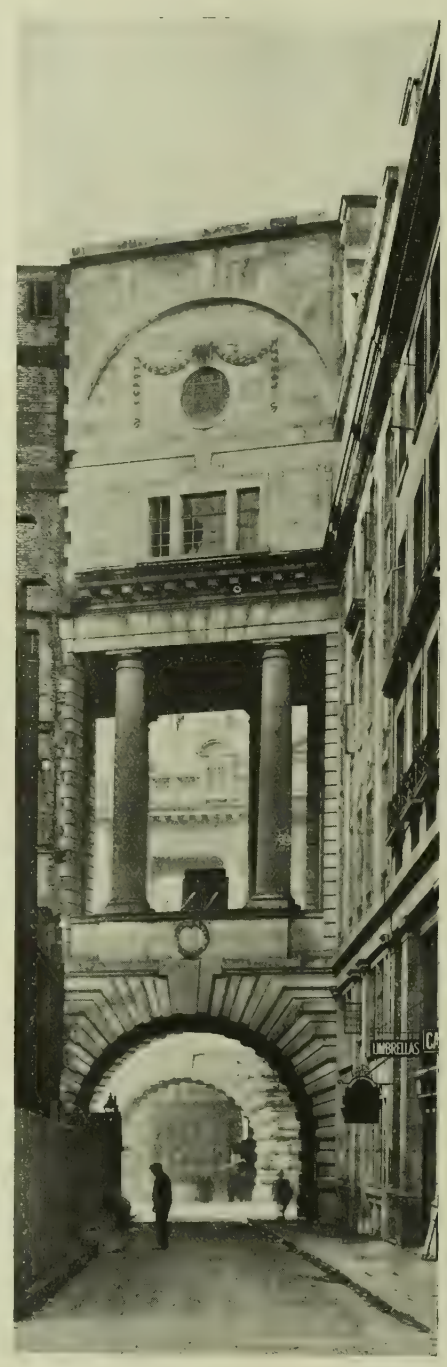
We have probably asked ourselves how much the designer of, say, the west front of Peterborough Cathedral knew about the Parthenon or the Baths of Caracalla, and whether this piece of fine architecture owes its purity to this detachment from historical knowledge, or attained its perfection in spite of this disability. The thought which naturally follows this train is that we ourselves might more nearly approach the quality of this and similar works if we knew less about the countless styles of the past. The deduction is plausible in the extreme, and is one too readily accepted by some, and too frequently burked by the remainder, for it ignores a number of outstanding facts.

Sophistication is a real thing and not a fancy, and we cannot, therefore, acquire the direct simplicity of the Dark Ages by closing our eyes to a great part of the knowledge which the present age places at our disposal. Again, however much the designer of the Peterborough facade—to return to our random examples—was oblivious of the Parthenon, the lineal descent of the one from the other is a fact that can be demonstrated, and which we ourselves know very well. The principles which govern fine architecture are eternal, and stand for all time. How can the student become conscious of these principles if he is to depend upon the experience of a single age for his guidance thereto; and how can he be sure of avoiding the following of a vicious fashion if he has not at his command all the available knowledge he can absorb? How can he fail, on the other hand, to find the fuller joy which beautiful things bring with them, the more fully they are understood, and the inherent relation between understanding and appreciation.

Those whose attitude of mind is expressed in Mr. Tasker's protest may reply to this point of view in some such terms as these: "Quite so: we admit that historical knowledge has its value and that it is one which cannot be ignored; but it does not follow that an ability to disgorge this knowledge on demand in the examination room denotes the finished architect. We assert that a test for this qualification should reveal his ability to build a house which, while conforming to the rules of good taste, will not fall over, or transgress the by-laws, or let in wind or weather. We believe that there are many men who are so far able, and yet are unable to draw from memory the plan of Somerset House, or that of the Roman Forum. We believe there are also many who are smart enough to surmount these theoretical obstacles, and who yet are unable to fulfil the practical problem, and that the first may fail to qualify, while the latter may do so with ease. Believing this, we are suspicious as to the efficacy of the present R.I.B.A. examination system."

Again, we are faced with a very plausible case, and again we find, on looking into it, that it ignores nearly all the essentials. In the first place it assumes, and quite falsely, that the test must equal the task. Suppose an ignorant man went to a doctor to be tested as to his fitness to undertake a walk from London to Brighton. He might be surprised to find a weird instrument applied to various parts of his body, as lungs and heart were sounded; and he might see little enough relation between these mystic rites and his powers as a walker. But his ignorance would surely touch unheard-of depths if he expected his medical adviser to set him to walk the actual distance before he would pass him as fit for the task. Yet this is exactly parallel to the point of view which some people bring to bear upon the subject of the form to be taken by qualifying examinations. The function of an architect is to build soundly constructed buildings: therefore, the only test required to establish his fitness as a practitioner—they would say—is that he should design such a building. Surely, this is absurd.

The examiner does not ask the candidate to draw a sketch plan of Somerset House because he is likely to have to repeat it in some future actual practice and for another purpose, but to find out whether the candidate has really studied the history of the English Renaissance so diligently as to be able to show evidence of his study whatever call is sprung upon him. He does not even ask him for a sketch of a Roman Aqueduct because he believes that the water supply of the future will be based upon similar principles, to the dismay of the plumber and fitter! He asks for this evidence to see by what degree the candidate has appreciated the beautiful way in which a classic age has met its own practical problems; knowing full well that a right handling of modern problems is more likely to follow with such an appreciation than without it. In what other way can the extent of the student's studies be tested? Certainly not by the exercise of one problem of design, or by that of a dozen for that matter.



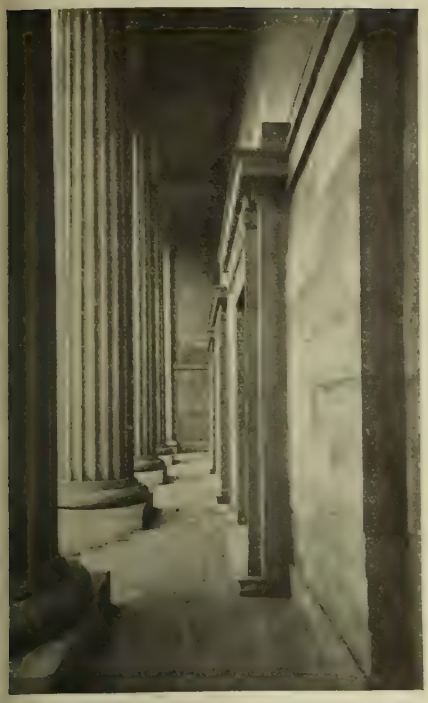
It is unfortunate that the machinery of a parliamentary debate, while admitting, if under protest, this form of popular attack, has not given opportunity for an adequate reply. The question at issue was whether the Institute shall be permitted to pass or reject the would-be architects of the future, and, being a matter of public concern, it is rightly being settled in Parliament. Whether the form of the test is perfect or not, is a question which the profession alone is competent to answer. Those who are not satisfied with the answer have their remedy in the Institute ballot box, as we pointed out a week or two ago. For ourselves, we believe that the high standard of modern design is the most conclusive answer to the doubtful, though doubtless there is still ample room for further improvement, as there is also equal scope for the betterment of the examination system itself. To build upon an existing, well-tested foundation, is however a very different thing to the sweeping away of the entire system, and building up afresh in an unknown and untried fashion. The one is directly constructive, while the other is no better than a leap in the dark; and we appeal to critics to assist directly by adding their units to a structure which is serving us well, rather than by attempting to destroy the careful work of several generations of sincere and thoughtful architects.

NOTES

The Conference. The Conference of the Royal Institute of British Architects now being held in London, opened very promisingly on Monday, notwithstanding the regretted absence of the President, Mr. E. Guy Dawber, A.R.A., and the varied programme arranged for the week is, we believe, giving general satisfaction. Many provincial architects are attending, and the Conference cannot fail to have good results, if only in hastening the growth of unity in the profession. The many receptions and visits to modern buildings by living architects as well as to historical buildings, afford excellent opportunities for the interchange of opinion and a growth of the consciousness of the common interests of the profession.

The Cenotaph, Liverpool. We understand that an influentially signed letter has been sent to the Lord Mayor of Liverpool by between twenty and thirty of the leading architects of the city urging that the consideration of the final decision of the site and the acceptance of a tender for the erection of the Cenotaph be deferred until the citizens have had an opportunity of viewing a model of the proposed work and judging its relation to St. George's Hall and the Plateau generally. They state that they consider it is essential that a model of the amended design should be erected on the proposed site, and that it should remain in position for a period of four weeks, and we hope that such a moderate and fair request will be agreed to. St. George's Hall is a building of national importance, which, we believe, the citizens of Liverpool are proud to possess and we shall be surprised if they do not support the request of so many architects of the city whose only object, we believe, is to ensure that the erection of a Cenotaph on the proposed site will not militate against the appearance of St. George's Hall. In any case, we believe the action of these architects will be approved by our readers, who will, no doubt, consider, as we do, that the Corporation cannot ignore a suggestion which it was the duty of the architects of Liverpool to make.

A Valuable Exhibition. A very pleasant feature of the Conference at the Institute this week has been the Exhibition in the galleries at Conduit-street, of some of the treasures which are housed in the Institute library. Though only a very small part of the valuable drawings and books which the Institute possesses, the collection affords a striking representation of the valuables stored in Conduit street. There are shown close on a hundred drawings of the Smithson collection, four in the Drummond-Stewart collection, and some two score drawings from the Burlington Devonshire collection. This latter number of drawings are part of a permanent loan; the other drawings all belong outright to the Institute. The more rare and valuable books dating from 16th and 17th centuries, are on a table in the centre of the gallery, whilst a few exceptionally interesting modern books are placed on side tables. As an instance of the interest to be found in these we may name the French farm houses, chateaux and small churches which are full of suggestions for the architect. Books of sketches and drawings by Peter Paul Rubens, George Devey, Norman Shaw, Wm. Burges, Geo. Maddox, G. S. Street, Wm. Chambers, Barry, Pugin, etc., are contained in a glass case. The beginnings of some fine Elizabethan and Tudor work may be studied in the Smithson collection, whilst beautiful drawings in sepia, wash and colour, by masters of this craft may be studied on the walls. Is it too much to hope that the time is not far off when such valuable possessions as these we have above referred to may become more intimately known, when the Institute may find room in its new home for a permanent exhibition which may be continually refreshed by changed exhibits? Needless to say, this unique exhibition had a very special interest to members of the Congress.



Architectural Feature over Air Street, Regent Street, W.

Sir Reginald Blomfield, R.A., P.P.R.I.B.A., Architect.

The New Regent Street. Regent Street is now practically rebuilt, small narrow sites only being still vacant. As to the result we suppose the general public will be satisfied enough, and consider it a great improvement on the cement frontages by Nash. With every desire to make the best of things, the architect who has a critical sense must look upon it with much disappointment, for not only is the right scale of the street destroyed, but the uneasy restlessness of modern design is a poor substitute for the breadth and dignity of the old plaster street. It is difficult to see how all this costly rebuilding is going to pay those who have invested in it, but we have been told that notwithstanding the prices of the new leases they have, in some cases, changed hands at a still higher figure.

The Quadrant. Notwithstanding the severe criticisms directed against Norman Shaw's Piccadilly Hotel front to Regent-street, we owe him something for his fine cornice line and roof, and in his treatment of the quadrant Sir Reginald Blomfield has wisely followed the lines of roof and cornice so that this part of Regent-street is now a redeeming point in the whole, and shopkeepers are perfectly satisfied with the window shapes and spaces, whilst the unity and dignity which have been secured go far to alleviate the loss of the earlier work; the general result as one enters the street from Piccadilly-circus is one of some dignity and distinction. The arched openings to the side thoroughfares have produced excellent street vistas, as one of our illustrations, taken this week, graphically shows. The loggia in front of the County Fire Office is a feature which the public will fully appreciate, and it forms a setting to some very effective views in various directions: one of these towards Waterloo Place we herewith publish.

Lost Opportunities. It is, of course, disappointing that our treatment of newly-created fine thoroughfares in London has so far failed to take a worthy advantage of the great opportunities which lay before us, and the conditions which

Friends' House, Euston Road, N.W.: View under Colonnade.

Mr. Hubert Lidbetter, A.R.I.B.A., Architect.

govern the rebuilding of London do not encourage the hope that the still great possibilities before us will be made the most of. Trafalgar-square might be made into a big fine *place* even yet, and the chances which are available for a new Charing Cross Bridge and its approaches are so enticing to the imagination that we may be forgiven if we anticipate with the most profound distrust designs which will be suggested. In an able and discriminating article in the *Observer*, Prof. Adshead has dealt very leniently with the shortcomings of Regent-street, though he awards well deserved praise to Sir Reginald Blomfield and Mr. Verity for their work in the rebuilding. There is some ground for hope that when the restlessness and uncertainty of our present-day efforts have given way to a finer and broader vision, we may yet accomplish something towards making London more worthy of its unique place in the world of peoples and cities.

The Geneva Competition.

We are glad to note from the Report of the Jury of Assessors for the League of Nations Competition (on the subject of which we published a leading article in our issue for June 3) that a tribute is paid to the excellence of much of the work submitted. It is stated that 377 architects took part in the competition and sent in thousands of drawings expressing their ideas in a practical and artistic form worthy of the object in view. Although these ideas did not achieve perfection, it is stated that the plans contained a wealth of valuable and original suggestions. The Jury was, however, reluctantly compelled to realise that its work was made difficult by the fact that a considerable proportion of the competitors had not adhered strictly enough to the material conditions required by the programme and rules. The Jury are probably right in their conjecture that the fundamental differences of conception shown in the designs is explained by the evolutionary phase through which contemporary architecture is now passing. We understand that the 27 designs which obtained prizes and supplementary awards have all been photographed with a view to the preparation of an illustrated album, and individual proofs of the photographs will be available shortly. It is hoped that the album containing reproductions of these photographs will also be available at the same time.

The Site for Gilbert's "Eros."

The various opinions expressed as to the permanent situation for this fine sculpture, which was moved at the time of the Underground extensions at the north side of Piccadilly to Embankment Gardens, reveals much difference of view. There is a good deal to be said for the quieter and more spacious situation, which the Embankment Gardens afford, but their is some reason in the argument that it should be returned to the site for which it was designed. We do not, however, notice that in the discussion, the views of the sculptor himself have been represented, and it appears to us that it is due to Mr. Alfred Gilbert that to his opinion should be given the first consideration.

The Cambean

We have received a copy of the first number of this vivacious periodical "wherein is set forth some of the work done by the students of the Camberwell School of Art." Both as evidence of the good work being done at this school and the efficient quality of the instruction, this well-produced magazine repays perusal. Illustrated by many examples of the student's work showing refinement in design and treatment, the subjects include illustration, modelling, wood-engraving, furniture, pottery, embroidery, etc. The "dissertations," by the "Professors" are well informed throughout, though attached to a rather harrowing phraseology, such as "equilibration," "experimentation," etc. But good sense and much promise is the pervading characteristic. We can only refer here in general terms to this capital periodical, and to the freshness and humour of M. Capes's verses, "Nelson's Column"; but much credit is due to a school able to throw so much sound method and good sense into its work. We shall notice on a later occasion the annual exhibition of the work of the students of this school, which opened on June 13.

View of Lower Regent Street through archway in Piccadilly Circus, W.

GENERAL NEWS

Professional Announcements.

Messrs. Kennard & Coffin, quantity surveyors, will move from Norfolk House, Norfolk-street, to Aldwych House, Aldwych, W.C.2, on June 29. Telephone: Chancery 7538.

Messrs. Henry Riley, F.S.I., and C. H. Riley, P.A.S.I., of 11, Victoria-street, S.W.1, and W. F. Fidgen, F.S.I., of 27, Chancery-lane, W.C.2, chartered quantity surveyors, have entered into partnership, and in the future will practise under the name of "Riley and Fidgen," at 32, Victoria-street, S.W.1. Telephone: Victoria 2177.

The association hitherto existing between Mr. A. K. Ball and Mr. C. E. Ball, practising as quantity surveyors at 7, King's Bench-walk, Inner Temple, ceased on June 21. Mr. C. E. Ball will continue in practice in partnership with Mr. E. E. Prower, F.S.I., and Mr. G. W. Ball, P.A.S.I., at 7, King's Bench walk, under the style of "C. E. Ball and Partners." Mr. A. K. Ball will continue in practice in partnership with Mr. E. H. Ashby, P.A.S.I., at 1, Mitre Court-buildings, Inner Temple, under the style of "A. K. Ball and E. H. Ashby."

St. Stephen's Hall Paintings.

The eight historical wall paintings by well-known modern artists in St. Stephen's Hall, Houses of Parliament, will be unveiled by the Prime Minister on the 28th inst.

The Twenty-one Gallery.

The address of this Gallery will be in future 15, Mill-street, Conduit-street, W.1. The headquarters of the Senefelder Club will also be transferred to the new gallery, and the Lay-Member Print for 1927 will be issued from this address.

Duke's Meadow Power Station.

The Select Committee of the House of Commons which for twelve Parliamentary days has been considering the proposed erection of a joint generating station at Duke's Meadows, Chiswick, has given its decision approving the preamble of the Bill, subject to agreement by the Central Electricity Board that this proposed station be part of the scheme being prepared by the Electricity Commissioners.

Town-Planning in England and Wales.

For the month ended May 31, 1927, a preliminary statement was approved (Stage BB) for Durham: North Tees Joint T.P. Committee (main area).

Preliminary statements were submitted (Stage B) for Lancashire: Blackpool T.C. (main area); Nottingham: West Bridgford U.D.C.; Middlesex: Feltham U.D.C.; and York: York T.C. (No. 2).

Resolutions were received (Stage A) for Devon: Paignton U.D.C.; York: York T.C. (Nos. 1a and 2a), and Flaxton R.D.C. (York T.C.); and Hertford: Harpenden U.D.C.

Soldiers' Memorial at Sandhurst.

The Prince of Wales recently unveiled at Sandhurst a bronze group of three soldiers which has been erected as a memorial to the rank and file of the British Army who fell in the Great War. A chapel in memory of cadets of the Royal Military College who lost their lives already stands in the college grounds, but the complete design has not yet been carried out. The three soldiers of the bronze group are represented standing back to back, and are a replica of the figures by the late Lady Feodora Gleichen which were set up at Monchy le Preux as a memorial to the 37th Division.

Houghton House, Bedford.

Thanks to private generosity, and at the original instigation of Professor A. E. Richardson, Professor of Architecture at the University of London, an opportunity occurs to preserve for the nation some ruins of great historical and architectural interest. The ruins are those of Houghton House, Ampthill, Bedfordshire, the traditional "House Beautiful" of Bunyan's "Pilgrim's Progress." The house was originally designed by John Thorpe, but additions were subsequently made by Inigo Jones and Sir William Chambers. The initiation of a fund to acquire and preserve the ruins is due to the Bedford Arts Club, generously supported by the Lord Lieutenant of the County of Bedford, the proposal being to transfer what remains of Houghton House to the town of Ampthill as a public monument.

The Brenforce Scholarship.—Exhibition of Drawings.

The Brenforce Travelling Scholarship awarded by the Institution of Structural Engineers, and value £300, has now been completed, and the 30 sets of final designs submitted are on exhibition at the premises of the Institution of Structural Engineers, 10, Upper Belgrave-street, S.W.1, until the end of next week, between the hours of 11 a.m. and 5 p.m. The Competition was one in design, and the subject chosen was a reinforced concrete water tower and tank. The Competition was divided into two stages. There were 64 entries. Thirty-eight candidates completed their esquisses, and 30 submitted final designs. The Scholarship has been awarded to Mr. J. Blackett, of Newport, Mon., who also receives the Gold Medal. The Silver Medal for the candidate placed second has been awarded to Mr. S. H. Suthers, of Kenton, Middlesex, and the Bronze Medal for the candidate placed third to Mr. E. W. Williams, of London.

New Reptile House at the Zoo.

Mr. E. Guy Dawber, A.R.A., P.R.I.B.A., Architect.

COMPETITION NEWS

Elementary School, Snapethorpe, Wakefield.

Competitive designs are to be invited from architects practising in Wakefield for the erection of a new elementary Council school at Snapethorpe.

Leith Town Hall Competition.

The full awards in this competition are given on page 1008. The winning design, by Messrs. Bradshaw Gass and Hope, FF.R.I.B.A., is illustrated in this issue.

Cemetery Chapel, Caversham, Reading.

We are informed by the promoters of this competition that the date for sending in designs has been extended from July 1 to Friday, July 8.

Electricity Offices, Stores, and Showrooms, Shoreditch.

Shoreditch Council propose to invite selected architects to submit competitive designs for the erection of electricity offices, stores, and showrooms, and to offer a premium of 50 guineas for the most suitable design.

Silvercraft Competition.

The Worshipful Company of Goldsmiths announce a competition aiming at the improvement of design in silverwork. Specimens selected by the Company's judges will be purchased by the Company to the value of £500 (provided that, in the opinion of the judges, sufficient good work is submitted), with a view to exhibitions in various directions of representative modern work. The judges will be Sir Edwin Lutyens, R.A., Mr. C. H. St. John Hornby, Mr. Charles Aitken, Director of the Tate Gallery, Mr. B. J. Fletcher, Principal of the Birmingham Art School, Mr. F. H. Courthope and Mr. Arthur Duvall Bishop, with power to add to their number.

The following list of articles is suggested:—Tea and coffee sets; afternoon tea sets and trays; small pots and jugs for coffee and milk; tea caddies; fruit dishes and tazzas; beakers; flower vases; electric lamps; candlesticks; sauceboats; egg cruets; pepper, salt and mustard pots and spoons; spoons and forks; waiters; inkstands; clock cases; napkin rings; small prize cups and trophies; child's christening gifts; tobacco boxes, cigar boxes, cigarette boxes and lighters; biscuit boxes; rose and flower bowls; ashtrays; sugar casters; bonbon dishes; shields and badges; plaques; any other individual work of art in the precious metals or combinations with enamels, crystal, horn, ivory, ebony and other wood, shagreen, bone, jade, precious stones, etc.

Competitors may send in work designed for any or all of the following:—Multiple production wholly by machine, work partly by hand and partly by machine, or individual work designed for production wholly by hand. The Competition is open to British subjects only. All entries must be sent to the "Clerk of the Goldsmiths' Company, Goldsmiths' Hall, E.C.2," before October 15, 1927.

The Worshipful Company of Goldsmiths is not a trading company. The sole object of this scheme is an endeavour to stimulate and co-ordinate the efforts that are being made at the present time to produce work in the precious metals worthy of the past traditions of the craft, and to interest the public in such work.

London Church Threatened.

The latest London church to be threatened with destruction and its site used for secular purposes is St. Peter's Church, Great Windmill-street, Piccadilly-circus. Built in 1861, it is a good specimen of Mid-Victorian Gothic architecture.

Banque Belge, Bishopsgate, E.C.

SIR EDWIN COOPER, Architect.

From the Conference Programme Cover.

The proceedings of the London Conference of the Royal Institute of British Architects opened on Monday last with an informal reception at the Institute premises, No. 9, Conduit-street, Regent-street, W. In consequence of indisposition, the President, Mr. E. Guy Dawber, A.R.A., F.S.A., was unable to be present, and the members and guests were received by Mrs. Guy Dawber, Mr. Walter Tapper, A.R.A., the President-elect, and other members of Council, the proceedings lasting from 9 to 11 p.m. Many well-known London and provincial architects and their ladies were present, and a most enjoyable evening was spent in conversation and the inspection of some rare and interesting books and drawings in the possession of the Institute. Light refreshments were provided, and smoking was indulged in, and although everyone regretted the absence of the President, probably everyone believed that, notwithstanding this fact, the opening reception was a very happy and successful function.

INAUGURAL MEETING.

In the absence, through indisposition, of Mr. Guy Dawber (President), Mr. Walter Tapper (Vice-President) presided at the inaugural meeting of the Conference on Tuesday morning. The meeting was held in the galleries of the Royal Institute of British Architects, in Conduit Street.

In opening, Mr. Tapper said he was sure he had their support in sending to Mr. Dawber, on their behalf, a message of sympathy, and an expression of hope for his speedy recovery.

He then read the address, prepared by Mr. Dawber, entitled, "The Work of the R.I.B.A." The great majority of the members, the address stated, had only a vague idea of the work carried on by the Institute year by year for the benefit of the members, and for the welfare of the profession generally. The work was far too many-sided for any one man to grasp with any degree of thoroughness, and he had therefore called upon his colleagues to supply him with material for their instruction.

But before he turned to the material supplied by his colleagues, he wanted to say something of a general nature with regard to the work and functions of the Institute, which for nearly a century past had been entrusted with the duty and responsibility of fostering the art of architecture and working for its advancement in the highest interests of the whole community. How did they discharge their task? First, and by far the most important, by helping to create well-trained architects, and next by endeavouring to secure for these men the appreciation of the public and an improved status in the eyes of the community. The regulation of architectural competitions had become one of the most important and interesting of the duties of the Institute. They had to ensure that the young, unknown and ambitious architect had fair conditions of competition, and competent and judicial assessorship. If the principal competitions of the past few years that had been conducted under their regulations and judged by assessors of their selection, were dispassionately considered, he thought they would agree that on the whole the system worked with remarkable smoothness and success.

The public, generally speaking, was not interested in architecture, and knew very little about it. But no one whose memory carried him back twenty or thirty years ago would deny that there was a very marked improvement in this respect. The Institute could fairly claim a measure of credit that improvement. The Press and the critics were at last beginning to talk w some regularity about architecture, and realise that it was time to know someth about it.

It was the task of the Institute to se as a bond of union between the archite of this country and those of foreign countr The award of the Royal Gold Medal ev third year to a foreign architect had stimulating effect upon those internatio relations, and the Institute had done m else to foster good relations with fore architects. The scene at the Guildhall November, when their new Honorary Fell the Prince of Wales, invested Rag Ostberg with the medal, was still fresh the memory of the public.

They were trying to secure a due app ciation of fine work by the award of London Street Architecture Medal, which become an annual event with the Pre the tablet commemorating the award wo soon become a distinctive feature in streets of London.

They had urged their brethren in the gr cities of the Empire to follow their exam and had offered them the medal for purpose. Scotland was first in the field, a few days ago the first medal was awar over the border for a fine building Glasgow. New Zealand followed close Scotland, and they hoped soon to hear the first award being made there too.

It was their task to serve as the bond union between the architects of this cou and those of foreign countries. They just assisted in the revival—after 13 y of disintegration—of the Permanent In national Congresses Committee, and in months' time they would be taking par the Congress at Amsterdam. In addi they had assisted in the establishment that unique social and artistic organism, Franco-British Union of Architects, wh had done so much to bring together t colleagues on both sides of the Channel.

The contributions of the Chairman of various committees contained the foll ing:—

Literature Committee.—In addition routine work, this Committee dealt v questions referred to it by the Council, suggestions from individuals. The follow were typical examples which had recently approved or rejected by the C mittee: (1) The loan to an Australian A Society of measured drawings of Eng buildings which were inaccessible to members. (2) A more comprehensive c logue for the Library, including a sp index of all articles published in the tec cal press. (3) A loan collection of lan slides to be managed by the Institute for use of members and Allied Societies.

Practice Committee.—In consequence of numerous complaints received concer whole-time public officials underta private work, the Committee colle evidence, and the attention of Government Departments, county cou and local authorities, was drawn to abuses that were prevalent or were pos under such conditions, and their assist was invited in suppressing that undesir practice. It was gratifying to learn the replies received that a large numb authorities promised to adopt, or adopted, the suggestions made to t Attention was also directed to several stances where unqualified officials, ever spectors of nuisances, had been, or about to be, appointed architects by authorities for their building schemes.

In consequence of some criticism by eminent counsel of the Institute's For Appointment of Arbitrator, the Comm had prepared new forms which it believed would prove beneficial to profession.

Applications were often received for as ance in bringing or resisting lawsuits, applicants had had to be told that R.I.B.A. had no funds for this pur Many undoubted cases of hardship had brought to the Committee's notice w

chitects had been involved in lawsuits ithout adequate funds to pursue them roperly, and as a result the Committee had vived a scheme for Professional Defence first ooted about 14 years ago. The scheme had en improved and enlarged, and for a subription of 3½ guineas a year architects, gineers, and surveyors would be indemni-d against claims for negligence, libel and nder, and actions for infringements of pyright, and claims for fees would be ught on their behalf. Not only would eir legal costs be defrayed in bringing an tion, but they would be indemnified against ose of their opponents in an unsuccessful tion.

Registration Committee.—When the Archi-cts' Registration Bill passed its second ading on April 8, the view was expressed at the Bill was not likely to go through is session owing to the pressure of Govern-ent business, as it was anticipated that rliament would be prolonged. Since en, however, Parliament had decided to journ in July, and resume its meetings in e autumn, so that there was a possibility, the event of the Bill being favourably ported upon, of its being put forward as an reed Bill for the third reading this session. ie important point was that the House of mmons had conceded the principle em-died in the Bill, and although that had en accompanied by a strong intimation at the title "Architect" would require to qualified as a condition of registration, he ought they ought to congratulate them-ves on their good fortune in having made much progress in Parliament in so short space of time. If some were disappointed not obtaining all they hoped for in the st instance, that should not cause them to ke adverse criticisms or do anything that ght embarass those who were charged with e task of bringing the matter to a success-conclusion. Rather they should accept at Parliament prepared to concede, and make such good use of it, that in due urse they might be able to demonstrate at they had reasonable cause to ask for extension of the powers. It must be membered that if the present chance of tablishing registration be lost, it was not ely that it could be obtained in the ture; they should therefore give the gistration Committee their hearty support, d show they had every confidence in the y in which they were discharging their sponsible duties.

After outlining the functions and work done the other committees, the address stated at the problem of providing new and rthy premises had become acute. In laboration with other members of the uncil, the Finance Committee had been ing into the matter, and within a few eks a definite scheme would be laid before e Council, which would, it was hoped, ovide a home worthy of a great institute.

An important task which the Institute ld taken up since the war had been that establishing closer and more helpful rela-ns between the great partners in the build-g industry—the architects, the contractors, d the operatives. They had formed two nt Boards—one of architects and con-ctors, one of architects and operatives—d at the moment the two Boards were eting as one to discuss a number of estions in which they were both equally erested.

Such a record ought to give them fresh nfidence in themselves, and in the work at they were doing, and a renewed deter-nation to do everything that lay in the wer of each one of them for the advance-nt of the art they loved, and for the build-g up of that great Institute.

Architectural Education.

Mr. MAURICE WEBB then gave an outline the development and work of the Board Architectural Education. It was, he said, ven years since the late Paul Waterhouse ve an account of the work of the Board. ring that period many changes had been de to meet post-war conditions, some of hich were outlined by Mr. Curtis Green at the International Congress in 1924. Broadly speaking, the main developments since Mr. Waterhouse vacated the chair of the Board had been in three directions; a reorganisation of the Board itself, and of the R.I.B.A.; prizes and scholarships; the increasing number of recognised schools; and the great care with which the Board watched the schools and its own examinations. The Board had been enlarged to include not only architects, but representatives of teaching authorities throughout the kingdom, in the hope that schools of architecture might benefit from the general experience of other kinds of teaching, and that other kinds of teaching might at the same time absorb some idea of the value of architectural knowledge to every kind of student. In that connection they had received great help from the Board of Education, the London County Council, and some of the universities, who had put their experience at the disposal of the Board in connection with examinations, scholarships, and other important matters. Altogether eleven schools had been recognised since 1921; six for exemption from the Intermediate Examination, and five for exemption from the Final Examination.

The guiding principles of the Board were: (1) To encourage the good teaching of architecture; (2) To protect the public from indifferent architects; (3) To guide the training of those who were to become architects in such a way as to fit them to perform their functions towards both their art and the public. There were two opposing schools of thought on the subject. One of these schools believed that an architect was a heaven-born artist, and could pick up all he needed of practical methods in an architect's or builder's office, and that his natural art would do the rest. The other school thought that an architect was another kind of genius, who could not possibly function properly unless he knew and had learned intimately the details of every trade connected with building.

Both schools could quote examples of architects who had been successful, and had built great buildings all the world over to support their point of view, and future generations would be able to do so again, but what everyone forgot in discussions on the question was that such geniuses occurred only very infrequently—perhaps once in a hundred years. But what were they amongst so many? From the point of view of really fine architecture, they were everything, but the business of the Board of Architectural Education was not with the few, but with the many. They wanted to ensure that the many secured the best possible chance of learning what could be taught of their art or craft, or profession, and that they were trained to give the public the best that was in them. In dealing with average men, they must not listen to opposing ideas on the theory of teaching the art of architecture, except in so far as those ideas led to keeping the pendulum steady between one extreme and the other, and they must watch the trend of modern development.

No artistic career was ever barred to the talented man, but many a talented man had become an architect who suffered all through life from a lack of a general education. To-day that was no longer necessary. Modern democracy had opened up the whole educational avenue from the elementary school to university, and post-graduate schools, to any boy of sufficient intelligence, however poor his parents might be. That fact alone must have, and had had, a profound influence on the attitude of the R.I.B.A. towards architectural education, and necessitated, when it was realised, the closest co-operation between the Institute and all schools teaching architecture. This democratic movement was first dimly recognised within the profession some fifty or sixty years ago, and was indicated by the formation of voluntary classes of students at such places as the Architectural Association, and elsewhere, and had now resulted in schools of architecture in nearly every city and university of importance in England, except Oxford—and he understood that Oxford was now contemplating a school of architecture. The war had its effect in speeding up this kind of architectural education. Young men who had lost valuable years of their lives had learned one lesson at least, and that was that the rudiments of any profession or craft must be taught and could not merely be picked up. They demanded schools all over the country, and they got them. Those that existed grew in numbers; new ones were formed or reorganised, until to-day they found themselves as a Royal Institute at the head of a great Empire-wide educational system. Their problem was now to alter it, but to see it did not become stereotyped and stale; to see that each school had its individuality preserved intact, and at the same time to help its students by accepting their work done in those schools in the place of the Institute's examinations; and seeing that the schools' curriculum and teaching came up to the standard that they had a right to expect.

They had another duty, and that was to see that the school system did not cause the pendulum to swing to the extremes of theory or practice. The school inevitably tended to theory. The students learnt the history of building, the design of building, the theory of building, but not intimate contact with building. In an office, and he was speaking of the average office, and the average school, the student was taught little of those things, but picked up what he could of the practice of building, the working drawings of building, and the routine of building. Of history and design and theory he might, or might not, learn something according to the type of man he was articled to. The Council of the Institute would not recognise any school for full exemption from its examinations, which did not include in five years at least one of practical study in an architect's office, or a builder's yard, in order to prevent the pendulum swinging too far in the theoretical direction. But in the matter of pupilage, the Institute had no control at all, except through its examinations, and in nine cases out of ten these could not be undertaken unless the pupil had reinforced his office work with evening classes in the local school of architecture.

It would be seen, therefore, that neither system alone was satisfactory. There must be combination. He had come to the conclusion that the first three years' whole-time study in a school was the most valuable grounding for any student, and that no architect should take a pupil who had not received such a grounding, unless he had the time himself to take his pupil through all the curriculum such a school gave, also access to examples of actual work, and the stimulus of competition with young men of his own age. After that his conclusion was that it must depend upon the boy. He did not find that the fourth and fifth years in a school produced the same results as the first three. Perhaps that could hardly be expected. For one thing, a much higher standard of teaching was required, and there was undoubtedly a tendency to staleness and artificiality in those latter years of a school course, and it was there that the corrective of an office might perhaps be applied more rigorously than at present. There was a tendency in the schools to regard the Institute's requirements of one year in five in an architect's office as something that could be split up into a month here and a month there until it totalled twelve—merely to qualify. It was the spirit, not the letter, of the requirements that needed emphasising, and he believed that in the next few years they would see the pendulum swinging back a little way towards more practical work in the school courses, to which the Institute gave recognition for final exemption.

It was no use disguising the fact that at present there was doubt in the minds of many members as to whether those great efforts towards better education of the future members of the profession were not being overdone. These doubts arose from two causes. The first was a genuine doubt as to how far theory ought to, or should, supplement practice, and the other a selfish doubt as to what value a theoretically-trained

school student was in £ s. d. per week, in an office, to the architect who employed him, compared with an office-trained draughtsman. His reply was that up to date the Board had bent their minds to training architects to be of use to themselves and the public, and had given no thought to the training of draughtsmen and office hacks, and did not intend to do so.

During the past two years the Board had undertaken a complete survey of the existing locations of schools of architecture, art schools, and technical schools that included architecture in their curriculum. It had been felt for some time that, with applications from such schools for recognisation coming in in increasing numbers, it was necessary, if useless duplication and overlapping were to be avoided, to arrive at a definite policy regarding the number of schools really required throughout the country for recognisation for exemption from the R.I.B.A. examinations. The policy arrived at was to encourage a large number of schools of a preparatory nature, *i.e.*, recognised up to the stage of exemption from the R.I.B.A. Intermediate Examination, while exemption from the Final Examination should be granted only to successful students in a few large schools.

Only the previous day the Board had arrived at a decision with regard to the schools of art and technical colleges that taught architecture to part-time students, but were not recognised for exemption from the R.I.B.A. examinations. They felt that the R.I.B.A. should help these schools, and see that the courses were not merely directed towards the cramming of students to pass examinations.

A vote of thanks to Mr. Dawber, Mr. Tapper and Mr. Webb was proposed by Mr. T. R. Milburn, and seconded by Dr. Percy Worthington, who expressed their hope for the speedy recovery of the President, and congratulated Mr. Webb on the able manner in which he had fulfilled the position of chairman of the Board of Architectural Education.

In a brief discussion that followed, Mr. H. M. Fletcher said he and all the members of the Board were sorry that Mr. Webb was vacating the chair of that body. During his years of office they had worked together in the greatest harmony, and his place would be very difficult to fill. Mr. Webb had occupied the chair not so much as an official as a statesman.

Mr. Stanley Hall said the R.I.B.A. had developed from a metropolitan gathering to one that embraced not only the British Isles but the whole of the British Empire. It was gratifying to know that a number of provincial architects were as familiar in the Institute rooms as were their London colleagues. It was a great source of strength to the Institute, and they were very proud that that should be so. The work done by Mr. Webb on the Board of Architectural Education would not be known for a generation. He had reorganised it, and made it an expanded and expansive body on broad lines, and now as he vacated the chair he had fixed a sign-post for their future guidance.

Mr. E. B. Kirby said that during the three years he had been a member of the Council the Institute had made great progress, and it was easy to imagine how great its influence and prestige might be in thirty years' time.

In responding to the vote of thanks, Mr. Walter Tapper urged architects to do all in their power to prevent the spoliation of the countryside by ugly and unsuitable buildings. That was, he said, one of the most important things they had to do.

Mr. Webb also briefly responded.

Conducted Tours.

In the afternoon members took part in a series of interesting conducted tours of buildings of architectural and historical interest in the City. Messrs. W. H. Ansell, F.R.I.B.A., C. Lovett Gill, F.R.I.B.A., and Gilbert H. Jenkins, F.R.I.B.A., acted as guides. Members afterwards took tea at the kind invitation of the Court of the Carpenters' Company. Yet another tour of interest was that to the Inns of Court, conducted by Messrs. F. R. Hiorns and H. B. Creswell, FF.R.I.B.A. In the evening, following an informal dinner for past and present members of the Allied Societies' Conference, held at the Criterion Restaurant, W., there were receptions held at the Architectural Association, at 34-36, Bedford-square, and at the University of London School of Architecture, Gower-street, W.C.1.

Wednesday, June 22.—Visits on the morning of this day were paid to various new London buildings. An alternative visit to new London stores included a drive to Messrs. Liberty's, Regent-street, Messrs. Peter Robinson's building in Oxford-street, and Messrs. Selfridge's store in Oxford-street.

In the afternoon the garden party was held at Hampton Court Palace, where Mr. Walter J. Tapper and Mrs. Dawber received the guests at the entrance to the Base Court. Immediately following the reception, the Conference photograph was taken.

An exhibition was on view in the evening in the R.I.B.A. Galleries, 9, Conduit-street, of a part of the principal gems—drawings, rare books, etc.—of the Institute's library.

Thursday, June 23.—Visits were paid in the morning to a number of places in the country of architectural interest. One party—conducted by Mr. H. V. Ashley, F.R.I.B.A.—visited Knole Park, Sevenoaks, and Penshurst. Another party went down by steam launch to Greenwich, while yet another party visited Eton and Windsor. In the evening a most successful ball was held in the Galleries at 9, Conduit-street.

Friday, June 24.—To-day's arrangements include the choice of an excursion to Oxford or to the North towns, via Guildford.

In the evening the Conference Banquet will be held in the Grand Hall, Hotel Cecil, W.C., when the Royal Gold Medal for Architecture will be presented to Sir Herbert Baker, A.R.A., F.R.I.B.A.

Saturday, June 25.—Excursions have been planned for (*a*) Cambridge, with a tour of the colleges, or (*b*) Canterbury, with a visit to the Cathedral and other places of interest. Alternatively, visits will be paid to the London Museum, with Mr. Sydney J. Tatchell, F.R.I.B.A., as guide, or to the Tate Gallery, the party being conducted by Mr. Gilbert H. Jenkins, F.R.I.B.A.

Conference Visits.

During the past week visits have been paid by members of the R.I.B.A. Conference to a number of buildings and places of historical interest in and around London. We give below brief particulars of some of the more important buildings visited.

Brewers' Hall.—Rebuilt completely after Great Fire by 1673. Repaired in 1859-60. [Described and illustrated in *The Builder* for February 23, 1927.]

Carpenters' Hall.—Present building erected in 1876 from designs of W. W. Pocock, F.R.I.B.A. [Described and illustrated in *The Builder* for January 23, 1920.]

College of Arms, Queen Victoria-street.—Red brick structure, completed 1683. Proportions of courtyard spoiled by shortening of wings, owing to construction of Queen Victoria-street.

Customs House.—Erected 1817 from designs of David Laing. Consequent upon a serious subsidence in 1852, the present river façade, designed by Sir Robert Smirke, was substituted for Laing's.

Dulwich Picture Gallery.—Designed by Sir John Soane, and opened in 1814. Contains work by Velasquez, Murillo, Watteau, Cuyp, van Ostade, Brekelenkamp, and Reynolds.

Fishmongers' Hall.—Present building erected in 1831-33 from designs of Henry Roberts. [Described and illustrated in *The Builder* for December 10, 1920.]

Goldsmiths' Hall.—Present building (fourth Hall) built from designs of P. Hardwick, R.A., and opened in 1835. [Described and illustrated in *The Builder* June 9, 1916.]

Gray's Inn Hall.—Begun in the reign Queen Mary. Entrance to the Inn in Holborn, is of brick, now covered with stu and was built in the reign of James I.

Greenwich Observatory.—Begun in 1 under auspices of Charles II. Extensive a tions since made.

Hampton Court Palace.—Built by Card Wolsey (1471-1530). Passed into posses of Henry VIII, who greatly enlarged it formed around it a royal park. Rebuilt great extent and added to by Wren un William III.

Inner Temple Hall.—The Refectory of Knights Templars. Virtually reconstruc 1816, and rebuilt 1870 in Perpendicular st from designs of Sidney Smirke.

Lincoln's Inn Old Hall.—Built in 1 New Hall and Library erected from desi of Philip Hardwick in 1845.

Mansion House.—Erected 1753 from designs of George Dance the Elder. Sc ture in pediment designed by Mr. (afterwa Sir) Robert Taylor.

Royal Courts of Justice, Strand. Erected from designs of George Edm Street, winner of competition held in 1 Begun 1874; completed 1882, under Art Edmund Street (son) and Sir Arthur Bl field, G. E. Street having died in 1881.

Royal Naval College, Greenwich. Originally Royal Palace, afterwards Ro Naval Hospital. Begun under Charles from designs of John Webb. Completed Wren. Queen's House by Inigo Jo Hawksmoor and Vanbrugh also represent Chapel designed by "Athenian Stuart."

Staticners' Hall.—Rebuilt after Gr Fire. Faced with Portland stone in 1 under direction of Robert Mylne. New w added 1888. [Described and illustrated *The Builder* for December 13, 1918.]

Temple Church.—Built 1185. Memo of the Knights Templars. Restored at ferent times, notably by Sir Robert Smir 1825-1842. Reredos and altar renovated enlarged by Mr. (now Sir) Reginald Bl field, 1908.

Tower of London.—Begun by G dulf, Bishop of Rochester. Work contin under Richard I, Henry III, and finished Edward III. Keep modernised by Wren.

Trinity House, Tower Hill.—Built 17 95 from designs of Samuel Wyatt.

Adelaide House, London Bridge.—John Burnet & Partners, architects. [scribed and illustrated in *The Builder* January 6 and March 10, 1922.]

Devonshire House, Piccadilly.—Thomas Hastings and Professor C. H. Rei F.R.I.B.A., associated architects. [Descril and illustrated in *The Builder* for January 1925, and October 8, 1926.]

Liberty's New Building, Regent-street.—The late Edwin T. and Mr. E. Stanley H F.R.I.B.A., architects. [Illustrated in *Builder* for July 27, 1923.]

Peter Robinson's Building, Oxford-circus.—Messrs. T. P. and E. S. Clarkson a Mr. H. Austen Hall, architects. [Descril and illustrated in *The Builder* for May 1923.]

Port of London Authority Buildi Tower Hill.—Sir Edwin Cooper, archite [Described and illustrated in *The Builder* October 20, 1922.]

Selfridge Store, Oxford-street.—The R. Frank Atkinson, F.R.I.B.A., archite Messrs. Graham, Anderson, Probst & Wh and Sir John Burnet & Partners, archite for extensions. [Described and illustrated *The Builder* for April 3, 1909, and May 1923.]

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Salaried Architects and Private Practice.

SIR,—I agree with you. "The question is not so simple as it looks." Nor as D. S. thinks it is. Much as we would like to believe D. S.'s noble altruism we know too much about it to be able to accept it. Any system which injures the majority for the benefit of the few must be strongly justified by some overwhelming gain for the cause affected. D. S. gives no real arguments to support his case. He says: "In their own interests, and also in that of architecture, architects as a body should do all they can to promote the idea." This proposal is to be carried out so that a few outstanding men who have, more by accident than choice, stumbled into Government posts, may have the opportunity of wielding their great influence. If the majority of men employed in Government and public offices were of this class there might be a strong case for carrying out D. S.'s suggestion, but when it comes to hosts of minor officials who, because of their privileged position, have access to, and opportunities of picking up, private work which are denied to the private practitioner, the question assumes a very different aspect. One would naturally assume that the greatest influence a man could exert on his generation and in his profession would be by doing the work he is paid for with all his energies. The wisdom of forming a subsidised class in any profession is to be doubted. If D. S.'s contentions are accurate, how does he explain the widespread feeling in the profession at the growth of this seemingly unjust practice? D. S. produces little evidence to support his theory that architecture as an art would gain by the general adoption of the principle he supports.

I would close with a quotation from one of your recent leaders:—

"Architecture has never prospered at the will of a Government."

AT SPES NON FRACTA.

SIR,—I have read with some interest the letter of "D. S." in this week's issue, but as he writes under a *nom-de-plume*, I have no idea who he is. I knew all the District Surveyors he mentions, and the nature of the work they carried on; and the difference between salaried officials in the Office of Works and District Surveyors also carrying on private practice is so apparent that I wonder "D. S." has the courage to endeavour to institute a similarity.

In the case of the Office of Works, these salaried officials have the benefit of premises, stationery, and every other attribute of a Government Department, without paying rent or any other outgoings; whereas the District Surveyors mentioned by "D. S." had their own private office, the upkeep and expenses of which they had to maintain out of their own pockets.

However, this very important subject of private practice by Government Architects and the Office of Works is coming again before Parliament; and I am awaiting the decision of the Council of the R.I.B.A. as to what action they propose to take in this matter, which is so detrimental to the architectural profession and to the art of architecture.

WM. WOODWARD.

5, Great James-street, S.W.1.

Statutory Examination for District Surveyor.

SIR,—With reference to your notes on page 920 of *The Builder* for June 10, and on page 961 of your issue for June 17, as to the lack of candidates for the Statutory Examination for District Surveyorships of London, may I suggest that some of the following may be reasons why so few candidates offer themselves for this examination nowadays?—

(1) The form that candidates have to fill in in order to obtain permission to sit for this examination seems too formidable for the average "student." Why should candidates have to state the places where, and persons under whom, they received their professional education, whether in practice as a principal or an assistant, their experience in directing the repairs or restoration of decayed or ruinous buildings, public or other buildings executed from the candidate's own design, etc.? This form could be very well simplified, provided the candidate was a member of any of the recognised technical bodies, such as the R.I.B.A., the Surveyors' Institution, the Institution of Civil Engineers, and the Institute of Builders.

(2) The present syllabus is practically the same as it was over twenty years ago, except in item 7, in which the dates 1905, 1908 and 1909 have been added to the L.B.A. Amendment Acts. This could very well be modernised.

(3) The Examination Questions are not published. This is unfortunate. I, as a would-be candidate, have had to ask men who sat for the 1926 examination what kind of questions they were asked, and how was the examination conducted; and from hearsay I gather that on the first day they had chiefly written questions, there being about eight candidates for the London Examination and two for the Provincial Examination, one of whom was given the London paper to work by mistake. The second day's examination consisted of a design for a cinema, that took up both morning and afternoon. For the third day, the candidates were first told to come in the afternoon, and then told to come in the morning instead, and, after waiting, one or two candidates only were examined orally before lunch, while the majority had to come back in the afternoon, waiting the whole day in the corridor, no waiting-room being provided. The oral examination could be omitted altogether, as that is of such a personal character. It must be remembered that the passing of this examination does not automatically make the successful candidate a District Surveyor—the London County Council interview the candidates and make the appointments; the only purpose of the Examination is to test the candidate's technical knowledge, and not to find out all his personal history.

(4) There are no classes or courses of instruction for this particular examination. The R.I.B.A. may be able to arrange for a course of instruction, and at the same time publish past examination papers.

I beg to ask if a reply to these suggestions could be received through your columns from the R.I.B.A., and the Association of Architects, Surveyors and Technical Assistants.

A WOULD-BE CANDIDATE.

Ugliness.

SIR,—The publicity you are giving to the subject of rural England cannot fail to do good by keeping the matter green in the mind of the public, making them think, and so educating them. But Mr. Guy Dawber's plea for more control is a remedy infinitely worse than the disease. The ugliness of many small houses, even those designed by architects, is often due to the laws regulating the height of rooms and by so doing producing bad proportions throughout. The reason why we are producing ugliness and loving beauty so little is because practical atheism is so prevalent. Changing public opinion is surely better than chaining it to rules and regulations formulated by persons no less likely to be prejudiced.

C. F. ANNESLEY VOYSEY.

A Shoemaker's Bequests.

Mr. Joseph Grantham, Scartho, Lincoln, retired shoemaker, in leaving £46,382, bequeathed £1,000 towards rebuilding the north aisle of Scartho Church and £1,000 for four stained-glass windows therein. He left also land and two cottages, and £7,000 for building and endowing almshouses for six inmates at Scartho.

MEDIEVAL PAINTINGS

THE annual lecture on aspects of art (Henriette Hertz Trust) was delivered recently by Professor W. R. Lethaby, Surveyor of the Abbey, before the British Academy, on "Medieval Paintings at Westminster." The lecturer described the Westminster Abbey Retable as, so far as he knew, the finest painting of the 13th century that existed—a work of supreme excellence in design, the craftsmanship of which seemed to surpass the powers of man. Great questions about this wonderful altar-piece were its date and authorship. There would be general agreement, he believed, that the date must have been about 1250 to 1270. Reconsidering the question of its origin again and trying to weigh the sum of many forms of evidence, he was more strongly than ever of the opinion that it was a French work in what might be called the Sainte Chapelle style.

The Coronation Chair was the work of a famous painter, and it bore on the "back" the figure of a king on a burnished gold ground. The king represented was doubtless Edward the Confessor. We knew from record that the chair was made about the year 1300 and decorated by Master Walter of Durham, the King's Painter. The whole surface was covered inside and out, front and back, with burnished gilding, upon which, besides the figure of the king, elaborate patterns were traced by lines and spaces of dots punched into the specially prepared surface while it was still elastic and leatherlike. The patterns themselves were in the manner of the gold embroideries of the time. On the inside of the arms comparatively wide spaces were covered with specially interesting and beautiful designs. One of these was of quatre-foils filled with devices, and the other was of birds among oak foliage all very naturalistic. The birds closely resembled those which were so frequently found on the embroideries of the time as to be almost specially characteristic of them. Similar birds were found in the sketch-book of an English artist now at Cambridge which, it had been pointed out, looked as if it might have belonged to an embroidery designer. He had long held the view that the most famous works of Opus Anglicanum embroidery were produced by highly trained experts in London shops, and therefore designed by London artists. Master Walter, the King's Painter, they might hardly doubt, was one of these.

One of the splendid early tombs in the Abbey, that of Eleanor of Castile, was certainly, as we know by record, painted by Master Walter. The painting on the tomb was done while Grandison was yet in the Holy Land and before the result of his mission could be known.

The lecturer also dealt at length with the sedilia and the tomb of King Sebert, the traditional founder of the Abbey, and made various suggestions as to the identity of the figures represented.

Remodelled Text-Books.

Recent years have witnessed the death of a number of scholarly architectural writers, and it has consequently been necessary to remodel entirely the standard text-books in the "Historical Architecture" Library, issued by Messrs. B. T. Batsford. Five volumes are announced for publication:—

"The Architecture of Ancient Greece," edited by Professor W. B. Dinsmoor, of Columbia University and Athens;

"The Architecture of Ancient Rome," rewritten by Dr. Thomas Ashby, late Director of the British School at Rome (both founded on Anderson and Spiers' "The Architecture of Greece and Rome").

"The Architecture of the Renaissance in France," by the late W. H. Ward, M.A., F.R.I.B.A., which has required only slight revision at the hands of the author's friend, Sir J. W. Simpson, M.A., P.-P.R.I.B.A.; in two volumes.

The late W. J. Anderson's study of "The Architecture of the Renaissance in Italy," which has been thoroughly overhauled and enlarged by a section on later work by Mr. A. J. Stratton, F.S.A., F.R.I.B.A.

Friends' House, Euston-road.

This building has been erected by the Society of Friends to house the various activities connected therewith. It consists of three separate blocks: "A" the Administrative Block with strong room, the Central Offices of the Society and the offices of the various bodies carrying on Friends' work. This block is entered from the strip of garden at the east end of the building, and is grouped round a central courtyard and connects directly with "B" block, in which are situated the large and small meeting houses, with their attendant cloak rooms, etc. In the basement of this block is the heating chamber for the whole building, and on the second floor is the caretaker's flat. The Small Meeting House, panelled in British Columbia pine, seats, with the galleries, about 275; the Large Meeting House seats 700 on the ground floor and 600 in the three galleries—1,300 in all. The walls of the lower portion are panelled in dark and light fumed oak, and the upper walls are plastered with special acoustic plaster by the May Construction Co. As far as it is possible so to do, the problem of hearing and being heard from all parts of a hall 70 ft. on the ground floor, plus galleries, has been successfully solved. "C" block, at the west end, to be called Drayton House, comprises five floors of office space with two lifts, and lavatories on all floors and escape doors to the gallery escape stairs of "B" block.

Messrs. Grace & Marsh, Ltd., are the general contractors, and the following are sub-contractors:—Dorman Long, Ltd., steel; the Bath and Portland Stone Co., Ltd., stone; the Patent Impervious Stone and Construction Co., Ltd., artificial stone and paving; Claridges Patent Asphalte Co., Ltd., asphalt; the Leckhampton Quarries Co., Ltd., interior stone; Roger Preston & Co., heating and ventilating; Girdlestone & Co., lighting; British Thomson-Houston Co., Ltd., electric fittings; Gilbert Allom, Large Meeting House lighting; George Wragge, Ltd., steel windows, wrot-iron work; Adamsez, Ltd., compo floors; General Contractors and Drytone, Ltd. (for the two Meeting Houses), joinery; Cheal & Co., gardening.

Mr. Hubert Lidbetter, A.R.I.B.A., is the architect; Mr. Arthur Boxall, F.S.I., the quantity surveyor; Mr. E. W. Cook, the steel consultant; Dr. G. A. Sutherland the acoustic consultant; and Mr. A. H. Bennett, A.M.I.E.E., the lighting consultant.

New Reptile House at the Zoo.

The new Reptile House at the Zoo was opened to the public last week. The double doors are surmounted by a crest of three rampant cobras, and the gateposts and lintel are decorated with other reptiles carved in stone from life by Mr. George Alexander. Otherwise the exterior, designed by Mr. Guy Dawber, A.R.A., P.R.I.B.A., depends for its artistic effect on the graceful proportions of the columns of purplish bricks, and panels of plaster, and its roof of Spanish green tiles. A short lobby leads directly into the exhibition hall, which has a central island block surrounded by a wide corridor for visitors. Each side of the corridor is flanked by the glass or wire-netting fronts of the cages. As in the Aquarium, the public corridor is lighted only indirectly through the fronts of the compartments for the animals, which are lighted from above. It is painted entirely in shining black, which sets off the light and colours of the actual cages, giving the effect of a brilliant picture gallery, or, rather (as Dr. Chalmers Mitchell, F.R.S., Secretary of the Zoological Society writes in the *Times*), of a series of magic casements opening on to tropical scenes of rockwork, water, and vegetation, in which lizards and snakes, crocodiles and terrapins appear to be almost in their natural surroundings.

For the decorative treatment it was decided to use painted scenery, and the experiment has been tried of using motor-car enamels made to resist changes of temperature and rather severe cleaning. Messrs. Hadfields, of Merton, made experiments with mediums and enamels, and Mr. John Bull, the theatrical scenic artist, found that he could use them. Accordingly, wherever possible, the rockwork and pools have a suitable background of scenery appropriate to the reptiles in the different dens. The electrical installation was devised by the Research Department of the General Electric Company, and executed by Messrs. Barlow Bros., of 61, New Oxford Street, W. Miss Joan B. Proctor, Curator of Reptiles, has been closely associated with the planning of the Reptile House.

The builders were Messrs. Prestige and Co., of Pimlico, S.W., with the following sub-contractors: Dent and Hellyer, plumbing, sanitation and hot water work; G. N. Haden and Sons, ventilation; Ames and Finnis, roof tiling; Crowborough Brick Co., facing bricks; Stancliffe Estates, Ltd., external stonework and dressings; Adamite Co., Ltd., Atlas White Cement for external plaster panels; British Challenge Glazing Co., roof glazing; H. Hope and Sons, metal frames to dens; Mr. John Pye, external metal casements; Stuart's Granolithic Co., black granolithic floors; Messrs. J. and W. Myers, wire work and iron doors to dens; Neuchatel Asphalte Co., asphalt work; and Albany Forge Wainwright and Waring, Ltd., iron barriers and hand-rail to public space.

Leith Town Hall Competition.

The assessor in this competition, Sir George Washington Browne, P.R.S.A., has made his awards as follows: 1 (£400) Messrs. Bradshaw, Gass and Hope, FF.R.I.B.A., 19, Silverwell Street, Bolton; 2 (£300), Messrs. Collcutt and Hamp, 126, Wigmore Street, Portland Square, London; 3 (£200), Mr. Henry Boddington, A.R.I.B.A., 26, Old Burlington Street, London; 4 (£100), James B. Dunn, A.R.S.A., F.R.I.B.A., 14, Frederick Street, Edinburgh, in collaboration with Mr. H. H. Wigglesworth, F.R.I.B.A., 7, John-street, Bedford-row, London. Forty-designs were submitted.

In his report, the assessor says: "I have no hesitation in according the first place to design No. 6. In a competition in which the general standard of merit is gratifyingly high, this design is conspicuous for the skill with which the whole problem of site and requirements has been faced and solved with due regard to good architecture and sound economy, and I am convinced it will give the greatest satisfaction in execution." The building is to cost £70,000.

The accepted design shows the library as a self-contained building adjoining Ferry Road, with direct access therefrom. It faces south, and the central entrance gives public access to all parts under staff supervision. The large and small halls can be used independently or together, and are placed so as to be away from any possi interference from street noises. Am entrances and exits open into the se circular roadway, and avoid interfere with the main stream of outside traffic Ferry Road, with minimum of risk accidents.

Croydon's New Arcade.

The new covered-in market or arcade Surrey-street, Croydon, which was offici opened by the Mayor of Croydon on 23rd inst., has been built on a site previou occupied by a somewhat ramshackle fu ture warehouse and some very old cotta The new market is light and airy, and architects have made the best use of space available. The site has a frontage 25 feet to Surrey-street, in which the m entrance is situated, with a total depth 164 feet. There is a narrow return Church-street, with another entrance to market from this important busin thoroughfare. The eastern boundary of market abuts on Fellmonger's-yard, throu which there is a right-of-way to the go entrance that has been provided on t frontage. The floor of the new building of concrete throughout, and the walls are 9 in. brickwork reinforced at every si course with "Bricktor." The market covered in by a roof of patent glazing carr on R.S. joists and stanchions. For con nience of letting, the floor space is divi into 63 sites of varying sizes. Tenants, v will not be restricted to one site if t desire larger space, are at liberty, subj to the supervision of the architects, to er shops and stalls to their own design, many of those that have already been erec are of pleasing elevation. Good lavat accommodation has been provided at southern end of the market. Over the m entrance in Surrey-street excellent resident quarters have been constructed, consisting a large living-room, two bedrooms, kitch bathroom, and an asphalted flat for dry clothes, etc.

The architects are Messrs. F. W. Rees Partners, 44, Park-lane, Croydon; and building contractors Messrs. C. H. Gibs Ltd., 124, George-street, Croydon. The s contractors are as follows:—Smith Walk Ltd., steelwork, roller shutters; J Thompson, Beacon Windows, Ltd., st casements; The British Challenge Glaz Co., patent glazing; The Strennic Constr tion Co., Corsham, Wilts, patent sto Salter Edwards & Co., Ltd., asphalt; Br & Quittenton, Ltd., Coulsdon, sanitary tings, ironmongery; C. B. Jackson & Ltd., stoves; Tamplin & Makovski, Lt Reigate, electric light; Pinchin Johnson Co., Ltd., painting; The Non-Stop Talk Signs, Ltd., Croydon, electric signs.

Other Illustrations.

We also illustrate this week a number progress photographs of important buildi now in course of erection in London. Th include views of the great new building Lloyds in Leadenhall-street (Sir Edv Cooper, architect) and of the new he quarters of the Liverpool Victoria Frien Society in Southampton Row (Mr. Char W. Long, F.R.I.B.A., architect). We a include on page 1003 a view of the Banc Belge, lately completed from the designs Sir Edwin Cooper.

MEETINGS

TUESDAY, *June* 28.

Institution of Municipal and County En neers.—Visit to Cement Marketing Co., K Cement Works, Greenhithe.

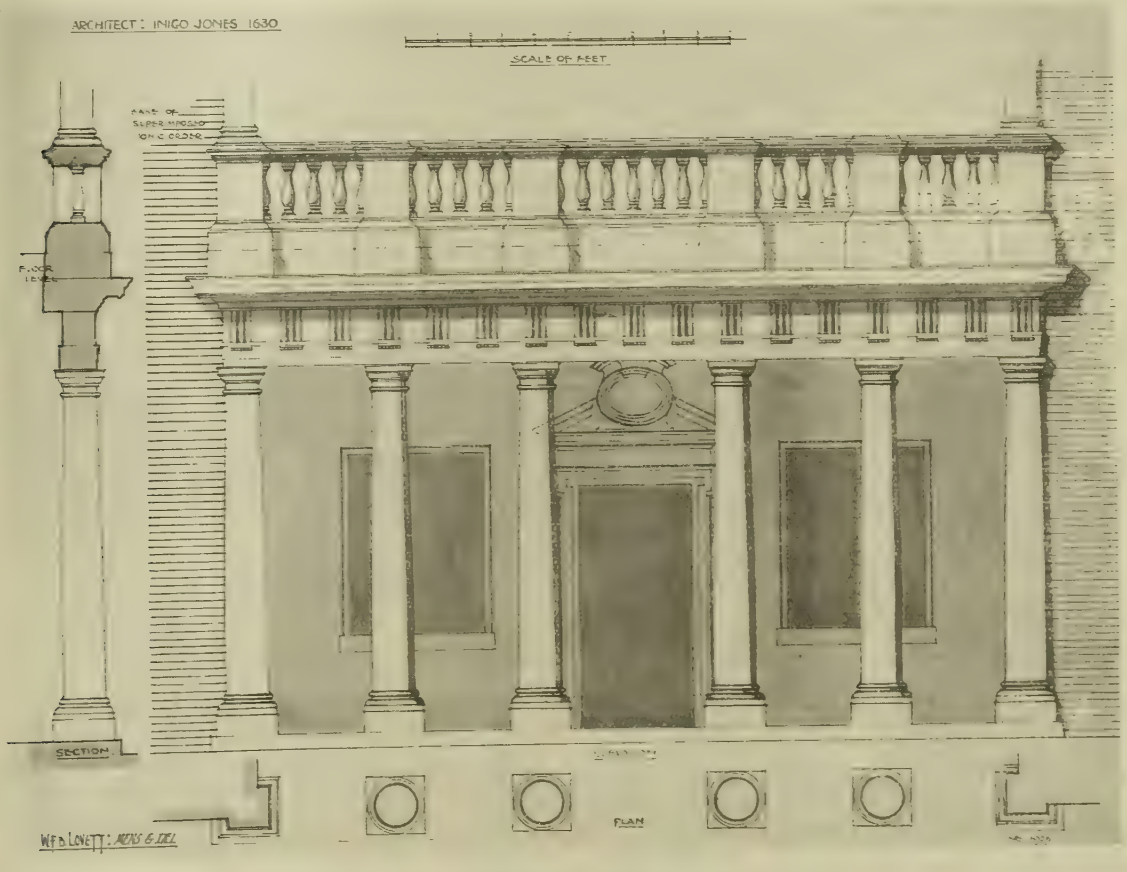
HOUGHTON HOUSE, AMPTHILL, BEDFORDSHIRE

We publish this week some illustrations of Houghton House, Ampthill, Bedfordshire, for which, on the score of its importance as a national monument, an appeal is now being made. The house was built for the Countess of Pembroke in 1615. Its historical interests are many, the chief being the association of Inigo Jones with the design. The theory is that the house was originally built for the Countess by John Thorpe and that Inigo Jones was called upon to complete the work. Sir Reginald Blomfield has expressed the opinion that Thorpe's connection with the building does not rest on strong evidence, and with this view we are inclined to agree.

In mediæval times the estate was in the possession of the Conquests, who gave their name to the parish and manor. Sir John Conquest served in the army of Henry III. The original house, called the Bury, was near the village of Houghton Conquest, and only a small fragment remains as part of a farmhouse on the site. In the reign of James I. Houghton, or Dame Ellensbury Park, was in the possession of Sir Edmund Conquest, and the King honoured Sir Edmund with a visit during the royal progress in 1605. It is recorded that James I. attended divine service in the Parish Church and listened to a sermon preached by the rector, Zachariah Grey, the author of Hudibras.

Records in the possession of the Duke of Bedford show that early in the year 1615 Sir Edmund Conquest, lessee under the Crown of Houghton Park, made over his interest in it to the Lady Mary Sydney, then a widow, through her trustees, Matthew Lister and Lionel Wellstead. In 1630 the two estates connected by the Bruce family were granted by Charter to one Ditchfield and others, who conveyed it to Sir Francis Clerke, whose heirs sold it to the Pigotts and again to the Earl of Aylesbury in 1675. In 1738 the estate was purchased by the Duke of Bedford and then to the Earl of Upper Ossory.



Thorpe's connection with the house rests upon scanty evidence. At the beginning of the 17th century Thorpe was engaged in building Toddington Manor, four miles away; he had also prepared plans for the remodelling of the mediæval castle on an adjoining height at Ampthill. This was about the time the Countess of Pembroke undertook the building of Houghton House, which, judging from the plans, as well as the character of the architecture, is in the manner of Thorpe. The fact that the walls of the north arcade and the western loggia show straight joints with the main building proves these features to be subsequent additions. From the character of the ornamental portions which survive there is little doubt that Inigo Jones, who was employed by William, Earl of Pembroke, at Wilton, was called in to exercise his skill.

The structure shows many fine features of brick; there are the usual architraves, mouldings and dressings of Tottenhoe stone of the period. The two loggias to the north and west on the other hand have details which approximate to the style of Palladio. The centre of the north front is similar to the arcade in the interior of the Convent della Carita at Venice by Palladio. The western loggia has a recess screened by a Doric portico, with the remains of an open loggia above in Ionic. The entablatures of the Doric order have metopes with the armorial bearings of the Sydney and Pembroke families. The principal feature of the south front was a central tower with concave corners and other interesting details in the Jones manner. From internal and external features, such as the style of the mouldings, the plaster decorations and finishings it is more than evident that Inigo Jones was concerned with the completion of the work.

When the house passed to the Earl of Aylesbury in 1675, various minor alterations were made, such as the insertion of the secondary main staircase. In the year 1765 Sir William Chambers was commissioned to repair the house and to alter the internal apartments in the west wing for the Marquis of Tavistock, who was said to be extremely partial to the idea of living near Ampthill. The Marquis was accidentally killed before the work had been completed, but the house was lived in by Lord Ossory, while alterations were being made to the 17th century mansion in Ampthill Park.

In 1794 Francis, the fifth Duke of Bedford, decided to dismantle the house and render it a ruin; many of the fireplaces and other features were distributed locally and have been traced to houses in the neighbouring towns. At this period the staircase, built in 1675, was removed to the Swan Inn, Bedford, which Henry Holland was building, and the gates and garden features, added in 1765, were taken away. From that time to the present day the remains of this historic mansion have been exposed to the weather and the hands of vandals, but sufficient remains to show its former grandeur. Examples of the early work of Inigo Jones and the style of the early 17th century are too few to be lightly ignored, and when such a building has the further distinction of being the traditional "House Beautiful" of "Pilgrim's Progress," it is only just that steps should be taken to preserve the ruins as a national monument.

Professor Richardson for a long time has taken an interest in the house and has had drawings made of the ruins. Working in co-operation with the Bedford Arts Club, he has recently initiated a movement to purchase the ruins, which has had the substantial

Houghton House, Bedfordshire : Loggia on West Side.

Inigo Jones. Architect.

Houghton House, Bedfordshire. Remains of Loggia on West Side.

support of the Lord Lieutenant of the County of Bedford, the Lord of the Manor, Mr. Anthony Wingfield and Mr. Alfred Bossom. The members of the Bedford Arts Club and other societies have subscribed generously in order that the property may be purchased and transferred to the town of Ampthill. The total sum required for the purchase is £300, and of this over £220 has been collected; an additional sum of £300 is required to clear away the ivy and to support some of the walls and to arrange for a cement coping to protect the ruins from further ravages. Subscriptions should be sent to the Secretary of the Bedford Arts Club, Mr. H. Fryer Smith, of 29, Warwick Avenue, Bedford.

All students of architecture have heard of these ruins and of the traditional connection of Inigo Jones with the work. Although definite information regarding the authorship of the completed design is lacking, and so far research has not resulted in documentary evidence, there is no reason to doubt the opinion of such antiquaries as Sir Reginald Blomfield, Mr. Alfred Gotch and Professor Richardson as to the authenticity of Jones's part of the work.

FRANCO-BRITISH UNION OF ARCHITECTS

Following is the programme of the Seventh Annual Meeting of the Franco-British Union of Architects, which is to be held in Paris from the 4th to the 6th of July :—

Sunday July 3.—Depart Victoria 2 p.m. Arrive Paris (Nord) 9 p.m.

Monday, July 4.—Morning : Reception of members by the President of the Société des Architectes Diplômés par le Gouvernement. Afternoon, 3 p.m. : Seventh Annual General Meeting of the Union at the rooms of the S.A.D.G., 120, Rue de Grenelle, Paris VIIme.

Tuesday, July 5.—Morning : Visit to the Château de Fontainebleau under the guidance of M. Brav, Architecte en Chef du Palais. Lunch at Fontainebleau. Afternoon : Visit to the Château de Vaux, where members and guests will be received and entertained to tea by Monsieur Sommier.

Wednesday, July 6.—Morning : Members of the Union and of the S.A.D.G. will be received by Monsieur Gaston Doumergue, President of the French Republic, at the Palace of the Elysée. Afternoon : Visits to new buildings in Paris. Evening : Members will be the guests of the S.A.D.G. at the official banquet to commemorate the 50th anniversary of the foundation of the Society at the Cercle Interallié, when the chair will be taken by the President of the French Republic.

Thursday, July 7.—Members and guests return to London.

Ladies may be invited to take part in the visits, etc., on July 5 and 6, but the official functions are strictly limited to members of the Union. Detailed particulars will be sent in due course to all members who wish to take part and attend the meeting; an early reply is requested to Lieut.-Col. H. P. Cart de Lafontaine, Secretary-General, 6, Gray's Inn-place, London, W.C.1, in order to facilitate arrangements. The headquarters of the Bureau during the visit will be at the Hotel Lutetia, 41, Boulevard Raspail, Paris, where rooms may be retained—if an early reply is received—at a reduced rate.

The agenda of the Seventh Annual General Meeting on July 4 includes the following items :—

Election of a President for the ensuing session. The following nomination has been received : Monsieur Georges Legros (Vice-President), President S.A.D.G., Member Société Centrale des Architectes Français, Officier de la Legion d'Honneur, etc.

Election of a Vice-President for the ensuing session. The following nomination has been received : Mr. E. Guy Dawber, A.R.A., President R.I.B.A., Fellow of the Society of Antiquaries, etc.

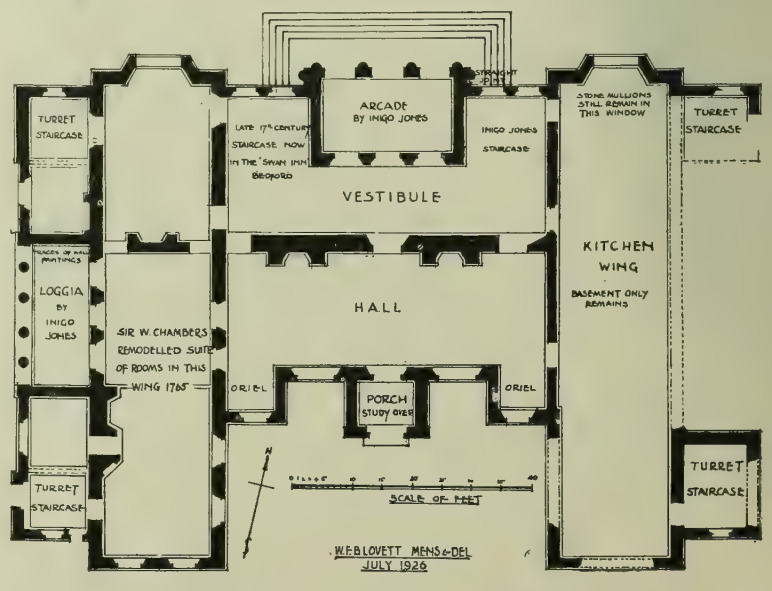
To receive the report of the joint committee with reference to the regulations for international architectural competitions.

THE REGISTRATION BILL IN PARLIAMENT

PROCEEDINGS OF SELECT COMMITTEE

The first sitting since the Whitsun Recess of the Select Committee of the House of Commons which is considering the Architects (Registration) Bill was held on Tuesday, June 21. Sir Clement Kinloch-Cooke presided.

Sir Charles Morgan, giving evidence, said he was a past-president of the Institution of Civil Engineers. The principal objection which that body had to the Bill was that the measure was so indefinite. There was no distinction as to what the nature of architect's work was nor how far it would be affected by the Bill. They had always had most friendly relations with the R.I.B.A. and were not wishing to hinder their scheme as outlined in the Bill, provided they could have it confined within some limits and provided the powers given could be understood by the engineers and the outside public.



The Chairman : You consider that the Bill will not benefit the public and will injure the civil engineers?

Sir Charles Morgan said that was so. What they objected to was that the provision with regard to the Admission Committee proposed to be set up under the Bill was so wide that the Committee might, and probably would, admit men who were engineers, such as structural engineers, and to that extent they might claim as architectural work work that had been in the past engineering work and apply to it their own conditions. There was an institution at the present moment that was called the Institution of Structural Engineers, and if this Bill were passed it would enable those people to call themselves registered architects and structural engineers, which would be a great encroachment on the work of the civil engineers.

Dr. Watts asked under what clause of the Bill structural engineers could be included as architects.

Sir Charles Morgan said the Bill did not mention the point specifically, but it could undoubtedly be the case. The Bill did not stop at saying that a man could be a registered architect, but went on to say that he might be a registered architect in combination with something else.

Dr. Watts : But the mere fact of being a registered architect would not enable a man

Plan of Houghton House, Bedfordshire.

to call himself a structural engineer unless he had the necessary qualifications.

The Chairman asked the witness if he could suggest any definition.

Sir Charles Morgan said that was just the difficulty. As engineers it was defined in their charter what a civil engineer was, and unless there was some definition in this Bill men might be able to trespass on that charter. It was well defined what civil engineers had to do, and their structural work was specified. It had been suggested in evidence before the Committee that bridges, for example, might come within the term architecture. Bridges at present were purely engineering work, and Waterloo Bridge, as an example, was built by an engineer, and architects had nothing to do with it.

In reply to the Chairman, Sir Charles said that if there were no roaming clauses in the Bill they would be prepared to let the charter stand as it was. They were asking permission to take their names out of Schedule 2, which set out the constitution of the Admission Committee, because if they were on that Committee and structural engineers were admitted to registration as architects, it would be tantamount to the Institution admitting that the work of the structural engineers was architectural work. The Bill would allow of men being drawn in who had passed no examination at all, and would allow people to be called architects who, in his opinion, were not architects and never would be

Mr. Tasker: Has not that always been so with the R.I.B.A., and are not most Fellows men who have never passed an examination but have been selected for their eminence?

Sir Charles: Yes, that has always been so, but I am referring to those people in a third-rate position. Many people who are practising what I would consider purely structural engineering will come in without any examination at all.

Sir A. Hopkinson asked the witness whether he would not feel confidence in the Admission Committee in view of the fact that it was to contain 12 architects.

Sir Charles said that if the Institution of Civil Engineers were on that Committee they would always be outvoted, but in spite of that their presence on the Committee would lead people to think that they were admitting as architects those men whom they wished not to admit.

Sir A. Hopkinson: When your Institution was first founded did you admit practising engineers without examination?

Sir Charles: Yes. That was found necessary, and I agree that it is necessary when starting a new institution.

Sir A. Hopkinson: And you introduced examinations later on?

Sir Charles: Yes.

Sir A. Hopkinson: May not the architects do that also?

Sir Charles said the position was not the same because the architects had their institution already.

Sir A. Hopkinson: You have found the establishment of your examination has had a beneficial effect on the profession?

Sir Charles: Yes, and in the interests of the public I think it is essential.

Sir A. Hopkinson: In addition to your examination system you have the hall-mark of the letters of your Institution?

Sir Charles: Yes, we have that.

Sir A. Hopkinson: Would it not be an advantage to the architects' profession to have some recognition of that sort if they have examinations and the equivalent of a title?

Sir Charles: They have it now, but this Bill, I understand, is to let in without examination men whom the Admission Committee will say are registered architects, and according to Major Barnes, when their examination does come about it is to be to a lesser degree than exists now. He (the speaker) considered that the R.I.B.A. under their present charter could ask for an Order in Council to call themselves registered architects, and thus get everything they wanted without this Bill. The Institution of Civil Engineers had no objection whatever to architects seeking registration.

The Chairman: Did not your Institution promote a Bill with the object of qualifying engineers?

Sir Charles: We did start a Bill of that sort, but we had so many institutions of the different branches of the engineering profession that we did not proceed with it.

The Chairman: That was the Civil Engineers Registration Bill, and now you are objecting to architects doing the same.

Sir Charles: No. We do not object to registration. Our own difficulty was that we found so many different kinds of engineers, each with their own institution, that we had to drop the Bill, and we went to the Privy Council for an Order in Council instead.

Sir Murdoch Macdonald: Have you any idea that if this Bill were passed, registered architects would encroach on the duties carried out to-day by civil engineers?

Sir Charles: I feel so very decidedly. The iron work and steel structure of the big buildings of to-day is all done by structural engineers, and the stone and masonry work by architects, but if this Bill were passed, the architects would claim that the iron work and steel structure was part of their work.

Mr. Lindley questioned the witness as to the position of engineers in regard to the construction of railway buildings, and witness pointed out that railway companies were absolutely exempt from building by-laws. The only thing in regard to which they had to submit to the examination of local authorities was the frontage line and sanitary arrangements. This Bill might, he thought, upset that position. If they let men in as architects by means of the proposed Admission Committee, the result would be that they would have a large number of young men as registered architects who would not be fit owing to lack of experience to assume the responsibilities thus put on them, and would be unable to get work. The Bill would entitle people who had spent five years in a drawing office to be registered as architects: in fact, they could demand registration under this Bill.

Mr. Tasker: Has your Institution experienced any difficulty in finding civil engineers?

Sir Charles Morgan: No. Our charter is sufficiently wide.

Mr. Tasker: Your fear is that if the R.I.B.A. cannot define what an architect is in their Bill, they may experience some difficulty in defining what is architectural work in a sense?

Sir Charles: Quite.

Mr. Tasker: Your difficulty is that registration is a matter which concerns the architects to-day, and you solved it in your own case through the powers of your Institution conferred by your charter?

Sir Charles: No. Our difficulty is that this Bill is going to create a new class of people who will call themselves registered architects, and will also admit certain other people.

Dr. Watts: You do not object to the registration of architects, but to Clause 5 of the Bill by which certain people are taken in without examination?

Sir Charles: I would not like to say that. The question of the Admission Committee is quite a different thing. They could take in men who are doing what we say is engineering work to-day. If we were on that Admission Committee as laid down in Schedule 2 of the Bill, it would be said that we were agreeing to it.

The Chairman: But you would be there to object.

Sir Charles: We would be only one on the committee. There is always a difficulty when you are starting a new institution, and you must take in at the beginning those who are established, but architects and the R.I.B.A. have been established a long time, and now they are trying to draw in some people who are not architects.

Dr. Watts: There is nothing at the present time to prevent a bargee or taxi-driver from calling himself an architect. What we want is a qualification laid down by Act of Parliament. You do not object to that, do you?

Sir Charles: We have not the slightest objection. All we object to is taking in people who are not architects.

In reply to Mr. Hirst, the witness said that if at the time of his putting up for election to the Institution of Civil Engineers any applicant called himself an architect they would not look at him.

Mr. Hirst: Is it within your knowledge that you have duplicate members of the R.I.B.A. and the Institution of Civil Engineers?

Sir Charles: No If they came to us and said that they were members of the R.I.B.A. we would not have them.

Lt.-Col. Moore: Your Institution has stated that you are going to show complete opposition to this Bill. Does that mean that you will not consider any amendments?

Sir Charles: No. We did not propose any amendments because we considered the Bill so vague.

Lt.-Col. Moore: Had you any conversations with the R.I.B.A. on the subject?

Sir Charles: Yes. We should have been satisfied if we had been put in the same position as the naval architects, who are taken out of the Bill altogether. Witness added, in reply to a question by Lt.-Col. Moore, that they were inserted in Schedule 2 by the R.I.B.A. without their consent or knowledge.

Capt. Wallace: You bar architects from sitting for your examinations. How do you define architects? That is what we are trying to do

Sir Charles: As far as our examinations are concerned, if a student says that his studies in the past have been architectural then he cannot sit.

Capt. Wallace: Then can you define architectural studies?

Sir Charles: No Other people have tried to do that. If the student has been articled to an architect then we say that he has been trained as an architect.

The Chairman: Is there any definition of a profession in any registration act?

Sir Charles: I do not know.

The Chairman: You are afraid of people receiving the title of registered architect because they are allowed by the Admission Committee to become registered architects?

Sir Charles: I have no confidence in the Admission Committee at all. To begin with, there are twelve architects on it. There are surveyors and quantity surveyors, and others who do not care two straws about engineering.

The Chairman: Do you not think that the Admission Committee will be able to distinguish between the work of an engineer and the work of an architect?

Sir Charles: I think they would in the case of two works very close together, such as structural work, but they will say that that work is architectural, and will take it in.

The Chairman: Were you not trying to do exactly the same as the architects when the Civil Engineers Registration Bill was brought forward?

Sir Charles: We found it too complicated.

The Chairman: Then the difference between you and the architects is that the architects have not found it too complicated. The Bill having passed its second reading in the House the principle is admitted.

The Committee then adjourned.

New Bridge Over Thames.

Having considered several schemes in connection with a proposed new bridge over the Thames at Hampton Court, the Joint Committee representing the Surrey and the Middlesex County Councils have approved in principle the construction of a new bridge on a new site, with a completely new road to join the London-Portsmouth road at the termination of the new Kingston by-pass road at Esher, the estimated cost of which is placed at £400,000. The committee have been authorised to carry on further negotiations with the authorities concerned.

ELECTION RESULTS.

Following are the results of the R.I.B.A. Council and other elections, 1927-28, announced at Monday evening's business meeting.

President.

W. J. Tapper, A.R.A.

Vice-Presidents.

H. P. Burke Downing.
H. V. Lanchester.
Percy E. Thomas (Cardiff).
Maurice E. Webb.

Honorary Secretary.

E. Stanley Hall.

Members of Council.

Prof. S. D. Adshead.
H. V. Ashley.
Robert Atkinson.
Sir Herbert Baker, A.R.A.
Major Harry Barnes.
H. T. Buckland (Birmingham).
Walter Cave.
Major H. C. Corlette.
H. S. Goodhart-Rendel.
Francis Jones (Manchester).
Arthur Keen.
Sir Edwin L. Lutyens, R.A.
T. R. Milburn (Sunderland).
E. C. P. Monson.
T. Taliesin Rees (Liverpool).
Prof. C. H. Reilly (Liverpool).
H. D. Searles-Wood.
F. T. Verity.

Associate Members of Council.

H. Chalton Bradshaw.
L. H. Bucknell.
Prof. L. B. Budden (Liverpool).
Lieut.-Col. H. P. L. Cart de Lafontaine.
Charles Cowles-Voysey.
G. Leonard Elkington.
Major T. Cecil Howitt (Nottingham).
Manning D. Robertson (Dublin).
Michael T. Waterhouse.

Licentiate Members of Council.

A. B. Hayward.
E. H. Heazell (Nottingham).
Lieut.-Col. P. A. Hopkins.
Capt. A. Seymour Reeves.
Percy J. Waldram.
Colonel N. H. Waller (Gloucester).

Past Presidents.

E. Guy Dawber, A.R.A.
J. Alfred Gotch.

Representatives of Allied Societies in the United Kingdom or the Irish Free State.

(1) *Six Representatives from the Northern Province of England:—*

J. M. Dossor (York and East Yorkshire Architectural Society).
F. E. Pearce Edwards (Sheffield, South Yorkshire and District Society of Architects and Surveyors).
H. S. Fairhurst (Manchester Society of Architects).
E. Bertram Kirby (Liverpool Architectural Society).
T. Butler Wilson (Leeds and West Yorkshire Architectural Society).
One Representative to be appointed by the Northern Architectural Association.

(2) *Five Representatives from the Midland Province of England:—*

E. T. Allcock (Leicester and Leicestershire Society of Architects).
E. C. Bewlay (Birmingham Architectural Association).
E. T. Boardman (Norfolk and Norwich Association of Architects).
J. W. Fisher (Northamptonshire Association of Architects).
J. Woollatt (Nottingham and Derby Architectural Society).

(3) *Four Representatives from the Southern Province of England:—*

A. C. A. Norman (Devon and Cornwall Architectural Society).
T. Overbury (Wessex Society of Architects).
J. A. Smith (Hampshire and Isle of Wight Architectural Association).
One Representative to be appointed by the Berks, Bucks and Oxon Architectural Association.

(4) *Four Representatives of Allied Societies in Scotland,*

nominated by the Council of the Incorporation of Architects in Scotland:—
T. M. Cappon (Dundee).
J. K. Hunter (Glasgow).
T. F. Maclennan (Edinburgh).
G. P. K. Young (Perth).

(5) *One Representative of the South Wales Institute of Architects:—*

C. S. Thomas (Swansea).

(6) *Two Representatives of Allied Societies in Ireland:—*

Prof. R. M. Butler (Royal Institute of the Architects of Ireland).
E. R. Kennedy (Ulster Society of Architects).

Representatives of Allied Societies in the British Dominions Overseas.—

To be nominated by the Council of each of the following:—
The Royal Architectural Institute of Canada.
The Federal Council of the Australian Institutes of Architects.
The New Zealand Institute of Architects.

Representative of the Architectural Association (London):—

Canberra War Memorial.

It is reported that the designs for the Australian War Memorial at Canberra were to have been referred to Sir Reginald Blomfield for award, but although the conditions stated that only £250,000 was available for the scheme, all the designs submitted were on a scale which would cost £500,000. They are, therefore, not being sent to England, but will be exhibited in Sydney and the other capitals so that the people of Australia may realise what a national war memorial may cost.

Housing Conditions in Westminster.

The report for 1926 of the Medical Officer of Health for Westminster refers again to housing conditions and to the schemes which are in hand for providing additional accommodation. On the difficulties of dealing with overcrowding, the report says:—"It will not be possible to take any drastic action against overcrowding in Westminster until that ideal state has been reached when there will be a surplus of houses in the Greater London area. It might be supposed that by erecting 500 additional houses or flats in Westminster a general easement of overcrowding would ensue, and that a spacing out would occur among the overcrowded families. But there exists a constant tide of those who are eager to live in Westminster, and who are willing to pay decontrolled rents in order to achieve that object. Thus there is an unabated demand for vacated rooms by people from other districts, and unless the conditions in which those persons have come to live are contrary to the regulations of the sanitary authority or are otherwise unsatisfactory, the sanitary authority are powerless."

BOOK REVIEWS

Manual of Historic Ornament. By Richard Glazier. (B. T. Batsford, Ltd.) Fourth edition, enlarged. Large Royal 8vo, cloth, 12s. 6d. net.

"Ornament is the means by which Beauty Significance is imported to Utility. It is ther Symbolical or Aesthetic. Symbolical rnament consists of elements of forms chosen r the sake of their *significance*. Æsthetic rnament consists of forms or elements chosen r their *beauty* alone, or in their power of ppealing to the senses."

This dictum, the initial one of a series of Terms used in ornamental art," appears on ıe last page of the text of this useful book, nd we can but feel that the author throughout ıe preceding 175 pages kept his aphorism ell in mind. This short section (page 176) ealing with "terms" might with propriety ave been placed in the forefront immediately ter the author's short preface setting forth ıe three-fold aims of the book; in short, to npart "an elementary knowledge of archi- cture and historical ornament, of awakening responsive and sympathetic feeling for the ıany beautiful and interesting remains of ncient and mediæval civilisation, and, lastly, f directing the attention of students and crafts- ıen to the beauty, suggestiveness, and vitality f the industrial arts of the past, and their ıtimate relation to the social and religious fe of the people." As a commencement of is studies any earnest student of ornament ould do well to memorise Mr. Glazier's page f "terms."

The book was first published in 1899, and, hen the third edition, 1914, was running ut of print, Mr. Glazier had passed away and, o bring the matter up to modern requirements, 6 plates with descriptive text have been added nder the hand of Mr. Francis M. Kelly, the uthor of "Historic Costume." These valuable dditions consist mainly of matter concerning lluminated MSS., Engraved Ornament, late tenaissance Wood and Metalwork, Textile Fabrics, and Peasant Art.

Part I, rather more than half the volume, eals with the history and development of rchitecture and ornament in 27 necessarily hort sections. Commencing with the Ornament f Oceania, we are shown that New Zealand ttained the highest development, whilst ustralia remained at a lower level in the rnament of Polynesia and Melanesia. From uch antipodean studies the author takes us on he usual course through the ornament of the ncient civilisations—Egyptian, Syrian, Greek, Romanesque, Byzantine, Scandinavian, and he Gothic and Renaissance schools, with light xcursions into Persian, Indian, Chinese and Japanese ornament. Part II deals with "The Applied Arts," in 26 sections, which include, *inter alia*, mosaics, ceramics, glass, stained glass, old and silver work, wrought-iron work, bronzes, bookbinding, decorative furniture, vories, wood-carving and, in fact, practically verything that has an æsthetic value in the rts and crafts of the ancients and moderns.

The handbook is admittedly a manual, prepared for the use of students and craftsmen, nd does not aim at being a complete survey. To state that 53 separate, if sometimes closely llied, subjects are dealt with in spaces averag- ng three and a half pages, is to admit that it s anything but exhaustive, but this we can uite frankly say: That the perusal of each nd every section—whether occupying but hree, five or even seven pages as in the case of "Ceramics" or condensed into one page as in "Glass" or "Bookbindings"—should act as n incentive to more exhaustive studies of tandard works indicated in the extensive ibliography at the end of the volume. This ibliography is brought up to date by the nclusion of such recent monumental works s those on decoration and furniture by Jourdain, Lenygon and Mulliner, and the "Dictionary of English Furniture" by Macquoid nd Edwards, and many others written since Mr. Richard Glazier passed away.

This book has stood the test of twenty-seven ears as a useful manual of historic ornament. In its new and revised form, with its added text and plates, bringing the total up to 600 pictorial illustrations, it should still have a long and useful life as a compendium and epitome of the achievements of decorative artists from the early ages down to modern times.

The penultimate section of the book treats of "Printed Initial Letters" with their beauty of line and added intricacies of ornamental details —delightful conceits and the natural successors to the illuminated letters of the mediæval MSS., as shown in the frontispiece; and it is of appropriate incident in the book's make-up that each section commences with an initial letter copied from one or other of the printed works of the fifteenth or early sixteenth centuries. Amongst them will be found examples from the historic presses of London, Milan and Venice, and others from the Flemish wood-cut alphabet of 1464. These letters, in themselves, constitute a grammar of ornament.

Amongst other qualifications Richard Glazier, A.R.I.B.A., was at one time head master of Manchester School of Art. Naturally he wrote and illustrated his manual with an inner knowledge of students' requirements, and we can commend this lucid volume to art masters and students alike.

Life in Regency and Early Victorian Times. By E. Beresford Chancellor. (B. T. Batsford, Ltd.) Large 8vo, cloth, gilt. 25s. net.

Mr. E. Beresford Chancellor says: "It is easier to reconstruct the outward appearance of the London of the first half of the nineteenth century, although its constant architectural changes make this no light task, than to present a picture of the life of the streets during such a time of evolution." Thomas Shotter Boys, in this latter direction, did us greater service than did any other artist of his time in his 24 lithographic views of London. These exquisite views give us, in addition to architectural features, a perfect microcosm of life in the streets during the first five years of the reign of Queen Victoria; and the inclusion in this book of four of Boys' views—Regent-street, Charing Cross, Mansion House, and "Society in Hyde Park" is a sure mark of the author's catholicity in illustrating. Altogether he gives us an excellent selection of views by such men as Alken, Pollard, Scharf, Blake, Richardson, Walker, Brooks, Shepherd and Rowlandson, to mention but a few of those who so ably pictured London at large, and in lesser degree the provinces in the days of the Regency dandies and the prudes of the Victorian forties. Pen, pencil and brush pictures of London and such fashionable resorts as Bath and Brighton, with their fashions and follies in Regency days, were in the mode, dealing, as they did, with the things that really interested the Regency people; but it is quite another matter when we come to such matter-of-fact places as Liverpool, Manchester and Birmingham, which were then growing by leaps and bounds from comparatively small provincial towns into mighty commercial cities.

The compiler of such a volume as this has no lack of material to draw upon, at least so far as the lighter side of life is concerned. Its success as a good record and a contribution to literature largely depends upon judicious selection and rejection; and it is in this that the author so admirably succeeds. His 80 plates, some whole page and others two or more to the page, comprising 150 illustrations all told, illustrate a text which presents a vivid picture of life in England in the years from 1800 to 1850. The portraits of the real celebrities are excellent, and the little Cruickshank cuts in the text afford delightful exaggerated commentaries. Those fifty years were not all made up of fun and frolic and manners and modes of the dandies; politics, commerce, art, science and literature were making gigantic strides; they were in literature alone the years we associate with Sheridan, Keats, Shelley, Scott, Lamb, Tennyson, George Eliot, the Brownings, Disraeli, Thackeray, Dickens, Wordsworth, Ruskin, Carlyle, and Macaulay; there were indeed giants in those days. Art was anything but dead, to mention but Turner and the Pre-Raphaelites, and architecture was not all "stucco and paint."

If we want a clear view of life in the Regency and early Victorian times we can find it in this book of Mr. Chancellor's, which he has written as supplementary to his "The 18th Century in London." What a book for the novelist to draw upon when casting his scenes in the Regency!

Lister and the Lister Ward in the Royal Infirmary of Glasgow: A Centenary Contribution. (Glasgow: Jackson, Wylie & Co.) 132 pp. Cloth, large 8vo.

To those who have had neither time nor opportunity to read the biographies of Lord Lister, by Wrench (1913), and Godlee (1917), this short résumé of the life work of the great anæsthetist will come as a very welcome addition to studies in sanitary science—studies which cannot be dissociated from perfect architecture and building. The book contains an interesting introduction by Lord Blythswood, and the four main sections of the volume, viz., "Lister," "The Infirmary Buildings," "The Efforts for the Preservation of the Lister Ward," and "The Lister Exhibition of Relics at the Wellcome Historical Medical Museum, London," are written, respectively, by A. Ernest Maylard, James A. Morris, A. Ernest Maylard, and L. W. G. Malcolm. Mr. Morris, in the appendixes, collates a list of public appeals and a humble plea for the retention and preservation of the Lister Ward at Glasgow. This historic Ward, for the preservation of which the special pleaders made out a good case in vain, is now past praying for; but the name of Lister is an undying one. It is good for anyone, even in the attenuated form here presented, to be reminded of what a little distance in actual years we are from the time when on entering a hospital or infirmary in a crowded city, one might expect to read over the portal: "All hope abandon ye who enter here." The work of that greatest of great surgeons and most lovable of men, Joseph, Baron Lister, is so well in the public mind that comment thereon would be superfluous.

The Safety of St. Paul's. By S. A. Alexander, M.A., Canon and Treasurer of St. Paul's. (London: John Murray.) 2s. 6d. net.

The safety and preservation of Wren's masterpiece, with its dome, which dominates London's landscape, have been on the public mind and conscience for many years. The daily Press and technical journals have been full of the subject; countless thousands of people in all parts of the globe have contributed to the various funds, amounting, in appeals, to £70,000 in 1914; £100,000 in 1922; and £140,000 in 1925; and in the case of the last-named appeal, the conscience of the world was so touched that the sum actually contributed amounted to £250,000. In spite of all this publicity, it is highly probable that comparatively few people could state concisely and accurately what should have been done or, more to the purpose to-day, what has actually been done and what there is still to be done in the matter of adequately preserving for future generations one of the noblest buildings in Europe. This little duodecimo volume of 80 pages should prove to be a handy memorandum for architects and builders and, in addition, make a direct appeal to the mere layman who has the preservation of his national parish church at heart. Canon Alexander, as treasurer of St. Paul's, has been a prince of special pleaders for a considerable number of years; his appeals, backed by a great Press campaign, appealed to all shades of opinion, varying from those who merely feared that the Cathedral was "in danger of becoming dangerous" to those who feared that Wren's soaring dome and cross might at any moment fall into Cannon Street. And whatever was or was not feared or thought in this highly controversial matter, Canon Alexander's clear and concise exposition of the *status quo* will be read with interest by all who possess his little work.

LEGAL SECTION

NOTES ON CURRENT CASES

WORKMEN'S COMPENSATION: INDUSTRIAL DISEASE.

A most important decision affecting painters has been given by the House of Lords in the recent case, Blatchford *v.* Staddon & Founds (1927, A.C. 461), which alters the law as previously laid down in the case Dean *v.* Rubian Art Pottery, Ltd. (1914, 2 K.B. 213). The appellant in this case was a painter, a man 53 years old, who had served in the Navy until 1918, when he received his discharge. During his service he had contracted lead poisoning. Since his discharge he had worked as a painter in 1920, and again from the beginning of 1923 until July, 1924 he was so employed by a Mr. Battershill. From July to mid-September he was unemployed, but from mid-September he was employed until mid-October by Messrs. Woolacot. After that he was unemployed for ten days, but on October 23 he entered the respondents' service, remaining there until December 12, when he left owing to illness, which was diagnosed by the panel doctor as cardiac trouble. On July 13, 1925, the certifying surgeon certified that the man was suffering from lead poisoning, and, on appeal by the respondents, this was confirmed by the Medical Referee. As no date was given in the certificate as to when the disablement commenced, the date of disablement was, under section 8, subsection (4), of the Act of 1906, to be taken as the day on which the certificate was given. (In the Act of 1925 this provision is contained in the same terms in section 43, subsection (2).) The appellant brought the claim against the respondents, the last employers, under section 8, subsection (1) (*c*), of the Act of 1906, section 43, subsection (1) (*c*), in the Act of 1925, which provides: "The compensation shall be recoverable from the employer who last employed the workman during the said 12 months in the employment to the nature of which the disease was due." The "said 12 months" is the period mentioned in subsection (1): To enable a man to recover compensation, the disease has to be certified as "due to the nature of any employment in which the workman was employed at any time within the 12 months previous to the date of the disablement or suspension. . . ."

The County Court Judge had held that the evidence did not satisfy him that there was anything in the nature of the appellant's employment with the respondents that would tend to aggravate or accelerate the disease from which he had been suffering for a considerable number of years, and following Dean *v.* Rubian Art Pottery, Ltd. (*ubi sup.*), made an award in favour of the respondents. In that case it was held that unless the workman, under subsection (2) of section 8, was "at or immediately before the date of the disablement" employed in any process within the Act (in which case there is a presumption that the disease was due to the nature of that employment), it must be proved that the disease was caused by the last employment. This must have meant, we think, caused or contributed to by the last employment. The present case was really an appeal from that decision.

The House of Lords, constituted of five Law Lords, unanimously allowed the appeal, holding that where the case falls within section 8, subsection (1), it is sufficient for the workman to prove that the nature of the employment with the last employer by whom he was employed within twelve months of the date of disablement or suspension was the same as that in which he contracted the disease, and Dean *v.* Rubian Art Pottery, Ltd. (*ubi sup.*), was over-ruled.

The judgments delivered in the House of Lords are very lengthy, and the Act was the subject of some criticism.

In this case the disease was contracted long before the particular employment, but liability attaches up to twelve months of the disablement or suspension, and the last employer is the only person the workman can proceed against. By the provisos to section 1, the employer can have recourse to any other employer who has employed the man within the period of twelve months, and if he can show that the disease was contracted in the employ of some other employer, he shifts the whole burden on to that employer; whilst if the disease is of such a nature as to be contracted by a gradual process, he can recover some contribution without proving that the disease was contracted in the employ of the employer thus called upon to contribute (see Mallinder *v.* Moore & Sons; 1912, 2 K.B. 124), a case approved by Lord Blanesburgh in the case we are considering.

In this case the workman had left the employment of the respondent some months before the disease was certified, and therefore subsection (2) had no application; but if the workman had been employed in any process mentioned in the Schedule to the Act "at or immediately before" the certified date of disablement or suspension, then, unless the certifying surgeon had certified that the disease was not due to the nature of that employment, the disease would be presumed to be due to the nature of that employment unless the employer proved the contrary. In such a case the onus is placed upon the employer of proving that the disease was not caused by a process the man was engaged in by him, but presumably this subsection only goes to the onus of proof, and does not affect the right of the employer to contribution if the disease is only contracted by a gradual process and is shown to be such: As was said in the House of Lords, the section is very difficult to construe, and Lord Blanesburgh pointed out that the word "employment," as used in section 1, is not used to describe the relation between employer and employed, but refers to the process in which he is employed, and both he and Lord Sumner considered that the decision in Dean *v.* Rubian Art Pottery, Ltd., had proceeded from a wrong interpretation of this expression. This being so, it appears that the presumption in subsection (2) only relates to the process the man was engaged in; but if the disease is one contracted by gradual process, there is nothing to prevent the employer from seeking contribution from other employers who may have employed the man within the preceding twelve months.

Unemployment Insurance Contributions.

A decision has been given in the case Attorney-General *v.* Paine (*Weekly Notes*, June 4), under the Unemployment Insurance Act, 1920, which is of importance as it overrules the decision of a Court of first instance. An employer was summoned in respect of unpaid contributions to two employees during the year 1926, and with the summonses a notice was served that in the event of his conviction it was intended to give evidence as to his failure to pay other contributions to the same employees during the previous year.

The defendant was convicted and ordered to pay the amounts specified in the summonses and costs, and in addition (under section 22 subsection (3)) the other amounts specified in the notices.

By an information dated October 15, 1926, the Attorney-General claimed from the defendant other unpaid contributions being the amount of the unpaid contributions less the amount of those paid under the order of justices, together with a claim for uncancel stamps. So far as can be gathered from report, the whole of the unpaid contributi for the two years amounted to £10 15s. 11 of which amount only £5 3s. 1d. had b paid under the order of the justices. T defendant pleaded amongst other things t as proceedings had been taken before justices, no other proceedings to recover c tributions could be taken, and this view adopted by the Court of first instance.

Section 22 subsection (3) of the Unempl ment Insurance Act, 1920, provides "Wh an employer has been convicted under foregoing provisions of this section of offence of failing or neglecting to pay contribution under this Act he shall be lia to pay to the unemployment fund a sum eq to the amount which he has so failed or n lected to pay and on such a conviction notice of the intention to do so has b served with the summons or warrant e dence may be given of the failure or negl on the part of the employer to pay ot contributions in respect of the same per during the year preceding the date when information was so laid and on proof of s failure or neglect the employer shall be lia to pay to the unemployment fund a sum eq to the total of all the contributions which is so proved to have failed or neglected pay. Any sum paid by an employer un the foregoing provisions shall be treated a payment in satisfaction of the unpaid c tributions and the employed person's port of those contributions shall not be recovera by the employer from the employed perso

Subsection (6), however, provides "Nothi in this section shall be construed as preve ing the Minister from recovering any su due to the unemployment fund by means civil proceedings, and all such sums shall recoverable as debts due to the Crown a without prejudice to any other remedy m be recovered by the Minister summarily a civil debt." The Court below had tak the view that this subsection was insert for the purpose of making it clear that wh the Minister might proceed before justices for the recovery of contributions was not bound to do so but might proceed a civil action for the money that was d but it did not mean that he could collect much as he could under the criminal proc and then sue in a civil action for the balan To the lay mind there appears much to co mend this view, but the Court of Appeal versed this judgment, holding that the rig given to the Minister under subsection was not merely an alternative right cumulative.

It is not clear from the present short port why the whole of the sums could be recovered in the criminal proceedings, presumably some of the sums could not recovered by way of criminal proceedin those proceedings being limited to a certa period before the issue of the summonses.

Arbitration Law.

A short point may be noted in connecti with an arbitration clause in a contract decided in the recent case De La Garde Worshop & Co. (*Weekly Notes*, May 2 The plaintiffs had entered into an agreeme to purchase the defendant's business Aklum Electric Batteries and in the agre ment there was a clause that the purcha should be subject to the condition "that t tests which are now being carried out by on behalf of the purchaser prove to his re sonable satisfaction that the Aklum batteri now being made by the vendors are capab of fulfilling the claims made for them." was further provided that if any dispu should arise between the parties as to t agreement or any clause matter or thir therein contained or the intention or constru tion thereof it should be referred to arbitr

tion under the Arbitration Act. The plaintiff refused to complete on the ground that the tests made by his experts failed to substantiate the representation made about the batteries, but the defendants maintained that the tests referred to in the clause were tests in the course of being made previous to the execution of the agreement and that the plaintiffs before the execution of the agreement had assured the defendants before the execution thereof that the tests were proving satisfactory and would be finally completed in a few days and that it was on the faith of that assurance the clause had been inserted, and that in August, 1926, the plaintiff had represented to them that the tests were satisfactory.

The agreement was dated July 29, 1926, and the sale was to be completed on November 30. On March 10, 1927, the defendant gave notice of the pending dispute to the arbitrators, but on March 15 the plaintiff issued the writ in this section. On an application to stay the action, under section 4 of the Arbitration Act, the Court held that this dispute, which decided the questoin whether or not according to the true construction of the condition in clause 5 of the agreement, having regard to the circumstances, the plaintiff was released from his obligation to purchase, was a dispute arising as to a clause, matter, or thing referred to in that clause, and the action must be stayed; if the contract had come to an end by some reason external to it, the arbitration clause would follow the fate of the contract, but the obligation here, if it had come to an end, must have done so by reason of certain events which had occurred, and which, by reason of the terms of the contract, had resulted in the plaintiff no longer being under obligation to purchase.

CAMBERWELL SCHOOL OF ARTS AND CRAFTS

ANNUAL EXHIBITION.

These annual exhibitions of important County Council schools are an evidence of the advance in educational methods over the old "so-called" Art Schools, and this Camberwell school well sustains the good repute which the improved system of teaching has brought about. Time was when it was difficult to speak with anything but very qualified approval and a general distrust of their usefulness had been felt by numbers of people. It is all the more gratifying to see the change to-day. This school displays very marked ability in certain directions of its work, especially in the pottery class, which, under the superintendence of Mr. Stanley Thoroughgood we should expect to be the case, from his practical experience as a potter himself. In these days of standardisation it is no unwelcome sight to notice the examples each marked in a measure with their own individuality. The seated figure of a youth and dog, the former playing on a pan-pipe, by G. H. Hibbert, in greenish-grey glazed earthenware, is noticeable for its grace and treatment. Lustre dishes, one of a lemon-gold colour, by D. Pethick, and another by C. Goodwin, are beautiful in colour and surface. Other work in this class by A. M. Leeming, R. Stebbing, and S. Wheeler, whose tiger, modelled and decorated with a quaint feeling and charm of its own, should not be overlooked. Nor does the mention of these few examples exhaust the list of those well worthy of mention.

The classes are so various, including design, illustration, lino-cuts, poster work, lithography, printing, woodwork and plaster work among them, that we must content ourselves with a mention here and there only of particular examples. The water-colours and drawings in the "composition" class show vivacity and not a little skill, those shown by L. E. Whitehouse, E. N. Acked, and L. G. Harris being amongst the best of them. The work of the last named shows very nice feeling and accomplishment. The embroidery by M. Hatfield, birds in a tree, table centres by G. Acraman and M. Laughton, charm us in their treatment and colour. The mirror-frames shown in the woodworking class are skilfully executed and of nice shape, and there is much to commend in the skill shown in the class for plaster work. First- and second-year student work also reveals a good average of ability in what is shown, without selecting particular examples.

In surveying the work of this school the improvement would appear to be largely in consequence of the teaching staff being chosen more on their qualifications as craftsmen than on the old system of diplomas. A teaching staff who are themselves of recognised ability as craftsmen, as at the Central School, gives a wholly new impetus to craft training, into the results of which we are now entering. It is seen in the work done, which is of so sound a character. This higher level of production is creating a demand for the work executed at the schools, commissions being received from time to time to be carried out by the students, aided by the direction. This is to the advantage of the student while working in the school. The difficulty is, however, felt later, when he starts independently, without the advantages and the prestige of the school any longer behind him. No doubt the school authorities would be anxious to direct opportunities of work into the hands of old students, retaining an interest in their welfare, especially as it is these old students who, by their work, have brought credit to the school, and we believe this to be the case.

The object, we think, should not be to claim for the school itself all orders for work received, but to direct them into the hands of those who have done credit to the school, so that in the difficult time of first starting independently, all the help possible may be given them. Otherwise the criticism we hear often made would appear to justify itself, that the school becomes a competitor on terms which put the independent craftsman at a disadvantage. We know that in the case of our prisons an instance of this kind occurred, the inmates being employed in the industry of brush-making. These brushes, when put on the market, led to complaint from the brush-making trade of the unfairness of the competition which led to their own brushes being undersold, and so the sale was stopped. We refer to this in no unsympathetic spirit but in order to discuss the matter on its merits, as the criticism is made that the independent craftsman, who is perhaps also a taxpayer, is thus called upon to contribute towards that which competes against him. The position enjoyed by these schools, in receipt of grants and other advantages, places them in a privileged position. It may be that this objection, which might have had some validity, is altered from the fact of the great improvement now to be seen in the work done at these schools, and that they are encouraging a demand for better design and workmanship in accepting commissions, in fact helping to make a market. This would appear to be the case, as we hear of students who have been trained at these schools establishing their own workshops—printers, potters, metal workers, etc. —who are better able to get a sale for their work. The exhibition will remain open until June 29.

CONFERENCE OF LOCAL AUTHORITIES

London Housing Problems.

Lieut.-Colonel C. B. Levita, chairman of the London County Council Housing Committee, welcomed the delegates to the annual conference of local authorities of London and the Home Counties at County Hall, Westminster. Discussing housing, he said that the Outer London authorities had not been pulling their weight. The London County Council had spent some £24,000,000, and their commitments stood at about £16,000,000. Altogether, 150,990 houses had been erected under the Housing Acts in the area with which the conference was concerned. The figures showed that the Outer London authorities had provided only half the number of houses built by the London County Council, and that they had taken very little advantage of the big subsidy during the three years in which it had been offered. He declared it was absolutely imperative to get back to the normality if they were ever going to have people housed properly. So long as they were content to see a loss on every house built, they would not get far. He also considered that if building operatives would give an honest day's work for their wages, the price of each house would be brought down by £100. High prices were preventing authorities from solving the housing problem.

Mr. E. R. Abbott, clerk to the Ruislip-Northwood Urban District Council, then took the chair, and the work of the conference began with a statement by Mr. J. G. Martin, secretary of the National Town Planning Council, which had arranged the conference. There was good reason, said Mr. Martin, to be satisfied with the progress made in the provision of new houses during 1926. More than 200,000 houses had been built during 1926, and 850,000 had been erected since the Armistice. The number of new houses required annually was 100,000, and so, at last, it would appear that the nation had begun to eat into the arrears of housing. The trouble was that very few of those new houses were available for the *direct* relief of families earning 70s. or less per week, which class comprised the great bulk of those in most urgent need of relief from bad housing. These houses were not available, because most of the houses built by private enterprise were built, not for letting, but for sale to owner-occupiers; while the remainder, along with local authorities' houses, were rarely available at rents which families earning 70s. per week—or less —could afford. There was a certain *indirect* relief to these poorer families, because better-to-do families, who now occupied the new houses, left their old homes available for the poorer families; but this relief was not great, for since the amendment of the Rent Restriction Act in 1923, landlords, once rid of a tenant, were rid also of the control of that Act, and could charge new tenants what rent they please. A means suggested by Mr. Martin as a remedy was that each Borough Council ought, without further delay, to take a special census towards ascertaining the numbers, whereabouts, and needs of families earning 70s. per week or less, who were living under housing conditions so bad that they could be classed as urgent cases to be relieved as soon as possible, in preference to all others. It was within the power of the Ministry of Health, under section 60 of the Housing Act of 1925, to require local authorities to hold such a census of urgent needs; such a census was successfully undertaken in Birmingham in 1926.

Exception was taken to the comparison made by Colonel Levita between the housing programme of the London County Council and local authorities, and also the statement that building operatives did not do an honest day's work, which was described by a delegate as "a slander." A resolution was passed to the effect that representations should be made to the Government in order that the subsidy for houses should be continued until the date of the next statutory review. Sir Leslie Scott, K.C., speaking on planning in rural districts, said very often there was no attempt at ordered development in rural building—it was scattered and often shoddy. He did not think the right of private property should be allowed to damage the beauty of the landscape. Arterial roads were being ruined by the type of building which was being erected along them, thereby adding to the traffic problem. The three things which were needed were certain additional powers to local authorities, the provision of competent advice to local authorities to ensure wise action, and the formation of a public opinion which would insist that there should be legislative amendments to save the country from the disfigurement which was going on.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS

ANNUAL GENERAL MEETING.

THE annual general meeting of the Association of Architects, Surveyors and Technical Assistants was held on Saturday last at the R.I.B.A. Rooms at Bedford-square, W.C.1. The meeting was well attended, and included many members from the provinces. Owing to the death early this year of the President (Mr. E. Fiander Etchells), the chair was occupied by the senior Vice-President, Mr. H. R. Surridge (Kettering).

In his opening address, Mr. Surridge referred to the steadily increasing power and status of the Association since it was inaugurated eight years ago. The growing numbers of salaried architects, and the increasing importance of the work done by them, had, he said, been accompanied by an overwhelming demand for their greater recognition, not by the public alone, but from the profession. It was, therefore, for the good of all architects, whether in their own practices or working as assistants, that the A.A.S.T.A. should have secured representation on the Council and Committees of the Royal Institute of British Architects, the Board of Architectural Education, etc.

Architects, including assistants, had for long been of the opinion that higher education and stiffer examinations would be a panacea for all professional ills; but in view of the prevailing overcrowding, casual employment, inadequate salaries and attenuated fees, and exploitation by big businesses, it was evident that an intensive educational system had failed to raise the status of the salaried architect. The A.A.S.T.A. had from the first recognised the limitations of the power of education, and the success that had attended its efforts to alleviate hardship, to effect reforms, and to bring these problems into the arena of practical professional politics, was full justification of its policy that by organisation and the co-operation of architects and their assistants, bound together by the impelling power of economic necessity, a higher and better status could be obtained. The immediate task of the Association was to secure for the salaried architect and surveyor not only his proper status and just remuneration, but to give to everybody the protection that his calling and employment demanded.

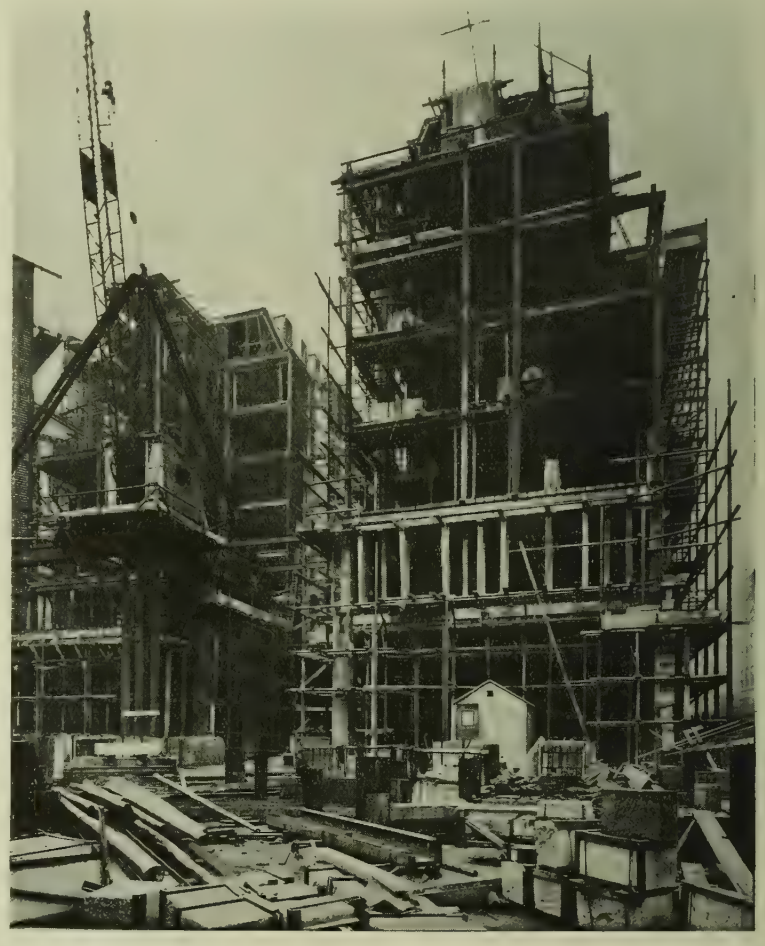
Not so many years ago the only drawback to the successful practice of the architect was the speculative builder, whose excursions into the field of architecture were principally in the direction of small houses. In those days, providing the trade of the country was good, the bulk of the building work passed through the hands of architects; and the architects employed assistants who ultimately commenced in practice for themselves, with the same happy results. Those were probably the good old days, but since then a gradual change had taken place, until to-day a large proportion of the work which would have been done by architects in private practice was in the hands of Government departments, Borough Surveyors, and large businesses employing their own architectural and surveying staffs. He did not suggest that the quality of the work was deteriorating, for that was not the case. But that change had resulted in the prospect of an assistant ever having his own practice becoming very remote. Salaried architects now comprised about 60 per cent. of the profession, and they must be protected by some body that would look after their interests. It was for that purpose the Association had been formed.

Major Hinkley (Chairman of the Executive Council) then moved that the Annual Report be adopted, and this was unanimously agreed. In the course of its review of the work of the Association during the past year, the report states that the Architects' Registration Bill has the support of the Association, but that the right is reserved to press for the adoption of any amendment that might be considered necessary to protect the interests of its members.——Owing to unusual conditions experienced last year, there was an exceptionally high percentage of unemployment amongst members for a period of six months. The position was now easier, but there were still a number of members seeking posts. Through the medium of the Central Employment Bureau, 61 members had obtained employment.——Salaries had remained fairly steady, but in some districts there was a tendency towards a lower scale. In certain towns, qualified assistants were paid as little as £2 10s. a week. The average salary of an experienced assistant in the provinces was now about £4 a week, in Scotland slightly less. The Council had taken action in many cases of inadequate salary. It was expected that members would be informed shortly of the result of the negotiations with the R.I.B.A. on the question of a minimum salary.—Steps had been taken to bring under the ban of the R.I.B.A. competitions in which assistants were debarred from competing.

In the discussion of the report, a number of members protested against the limitation of competitions to practising architects, and it was stated that this tendency was increasing. The limitation of competitions to a selected number of architects was also protested against, and open competitions in all cases advocated.

A resolution was carried instructing the Executive Council to discontinue the affiliation of the Association to the National Federation of Professional Workers.

Annual Dinner.



In the evening, Mr. H. R. Surridge presided at the annual dinner of the Association, held at Anderton's Hotel. Over a hundred members, including a considerable proportion from the provinces, were present.

In proposing the toast of "The Association," Mr. G. Verrall Reed pointed out the desirability of people with common interests associating together for their common good. It was, he said, essential for the well-being of the world that men should live for each other, and not for themselves alone.

The toast was responded to by Major A. S. Hinkley. At the end of one of its most difficult years, he said, the Association stood higher in prestige and status than ever before. When it was founded it was the only association that catered for the salaried architect and surveyor, and it was still the only body that set out to be of service to the assistant.

Mr. C. Bertram Parkes, L.R.I.B.A. (Birmingham) proposed "The Visitors," and mentioned that the Association was now generally recognised, and was in a position to obtain its objects by co-operation rather than by fighting. Mr. A. N. Cathcart replied.

Mr. John Mitchell (Secretary) proposed the toast of "The Chairman," who, in responding, congratulated Mr. Mitchell on his able and energetic conduct of the affairs of the Association during the difficult year just passed, and also on the great part he had taken in bringing the Association from practically its commencement to its present influential position.

Royal Mail Steamship Company's New Premises, Leadenhall Street, E.C.

SIR EDWIN COOPER, Architect.

This view shows the work as it was when held up during the strike of 1926 through lack of steel.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as widely as possible, or, better still, in typewriting?—ED.

Artificial Stone.

SIR,—How should artificial stone be measured up for quantities? I presume the method is entirely different from that applied to ordinary masonry.

FRESHMAN.

Worm in Oak.

SIR,—We are a firm of builders specialising in erecting good class property with all joinery work in oak. During the past few weeks we have had about six complaints of various portions of our woodwork in houses becoming worm-eaten, and are at a loss to understand this, as it is arising in houses which have been erected for from 18 months to two years, and from which there has been no previous complaint, whilst, strangely enough. we are not getting any complaints from newly erected houses. Our outside joinery work is in English oak, whilst the inside finishings consist mainly of American or Japanese oak, and we can only suspect the English oak, as we would naturally suppose that any insects or their larvae would be destroyed during the process of seasoning. If any of your readers have had similar experience of this trouble, and could favour us with a cure, we should be extremely obliged.

OAK.

Plague of Ants.

SIR,—I should be obliged if any of your readers could tell me how to get rid of a plague of ants. The portion of the house infested is a pantry, sunk about two feet below the ground level. It has a concrete floor and brick walls. "HEREWARD."

Painting over Keene's Cement.

[REPLY TO "CORRESPONDENT," JUNE 10.]

SIR.—I much prefer Keene's or Parian as a surface suitable for painting in its new state. Where this is done, the priming coat should be applied as soon as the setting coat of cement will stand the brush and before it has set hard. The effect is for the first coat of paint to set in with the cement and form a sealed surface through which alkali cannot attack the paint. This class of cement has the virtue for paintwork if it is allowed to set hard before priming, unless left for a period practically as long as that required in the case of plaster.

FOLLOW UP.

Pointing Brickwork.

[REPLY TO "DOUBTFUL," JUNE 17.]

SIR,—I have examined brickwork pointed in the way described by your correspondent, after nine or ten years from execution, and have never found any defects arising from the method. As a general rule the bricks are more porous than the mortar joints, so that no amount of impermeability in the face of joints will improve a wall where the bricks themselves do not resist the weather. I am convinced that the "pressed" joint is inherently bad, since it promotes an uneven resistance to settlement and a tendency for the compressed mortar to be forced apart from the natural mortar joint. It is no doubt yet another instance where good appearance indicates right method.

TEXTURE.

Levelling.

[REPLY TO "WORKS," JUNE 17.]

SIR,—If the levelling of the court is prior to the finishing of the actual surface, *i.e.*, where hard court surface is to be applied on a suitable foundation, or where fresh soil is to be laid thereon for grass sowing or turfing, the digging out of the high portion should be executed to its proper true bottom in the one operation, and the filling-in also governed by the levels. In such cases I think it would be sufficient to give a cubic quantity described as digging, not exceeding ... feet deep, in ..... soil, to true and level bottom, wheeling not exceeding ..... yards, filling in and spreading to true surface. Where the finished surface is to be the actual grown surface, it would be necessary to give in addition a super area suitably described, and providing for laying aside top soil and spreading on new surface.

GARDENS.

Road Charges.

[REPLY TO "HOUSEHOLDER," JUNE 17.]

SIR,—These are usually apportioned according to benefit derived, which can only be assessed after consideration of each individual case. All potentialities should be considered quite apart from the immediate intentions of the householder. For instance, if the corner site were sufficiently deep to permit of a building site being cut off the end of same with a frontage to the new road, the householder would not be able to establish that no benefit arose, because he had no intention of availing himself of it. Again, were the corner house of such narrow frontage on the main road as to leave no room for a garage approach, which became possible when the new side road were opened, the property would be considered to receive a benefit, although the owner had no immediate use for a garage.

IMPERSONAL.

Surveying Fees.

[REPLY TO "MEASURING UP," JUNE 17.]

SIR,—It is usual to base such fees upon the time spent upon the work. Principal's time varies in value according to the standing of the firm, but in most cases it should be taken as worth three guineas a day. The value of basing fees in such a way is that it can be soundly substantiated from diary records.

ARCHITECT.

Thickness of Walls in One-Story Buildings.

[REPLY TO "ESTIMATOR," JUNE 17.]

SIR,—The building described appears to be a "building of the warehouse class"; and since it has always been conceded that the walls of such buildings must obviously be of greater strength than those of "domestic buildings," it follows that by-laws framed upon the Model by-laws provide for a greater thickness of walls in the case of "buildings of the warehouse class," which are defined as meaning a "warehouse, factory, manufactory, brewery or distillery." If "Estimator" obtains a copy of the by-laws of the local authority concerned, he will there find all he requires as to thickness and heights of walls. The dimensions of the stores and thicknesses of the walls given obviously do not comply with the Model by-laws, for the minimum thickness of a brick wall for a building such as is described is thirteen and a half inches at its base, whatever is its length, and its height does not exceed twenty-five feet. The like thickness will, therefore, be required in this case.

WALL.

Unstable House Building Society.

[REPLY TO "ARCHITECT," JUNE 17.]

SIR.—As a director of one of the oldest and largest building societies in London, I am able to inform your correspondent "Architect" that the practice (at least in that Society) is to regard the architect-designed house as affording a superior class of security for an advance. The value of good planning, considered elevations, a specification, and the benefit of an architect's supervision during erection, are fully recognised by the Board of Directors (of whom the chairman and three other members are architects) and reflected in the amount of the advance offered. With an architect's drawings and specification to submit with his application for an advance, the prospective building owner can make his financial arrangements with confidence in the knowledge that the society will make the agreed advance by instalments as the work proceeds. As "Architect" suggests, the matter is one of interest not only to the profession, but to all who contemplate building, not merely a house, but a home.

NATIONAL.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Working-class Houses.

Mr. Forrest asked the Minister of Health the number of houses now being built by private enterprise for working-class families only, and whether they were receiving the subsidy.

Mr. Chamberlain said that he had no information as to the intended occupancy of houses which were under construction by private enterprise, but 45,495 subsidy-houses were under construction in England and Wales by private enterprise on the 1st inst. Statistics were not available as to the number under construction without State assistance.

Rent Regulations.

Sir A. Holbrook asked the Minister whether, in view of the fact that Part II of the Rent and Mortgage Interest Restrictions Act was to continue for five years after December next and that it provided for referring any matters of hardship to the court, he would consider the termination of Part I next December; and whether, in any circumstances, he would consider making provision that persons who have bought houses for their own occupation, but who were now debarred from occupying them, might be allowed to take possession of their properties.

Mr. Chamberlain said that the suggestions would be carefully considered in connection with the future of the Rent Restrictions Acts.

A Ryde Scheme.

Mr. R. Young asked whether the Ryde, Isle of Wight, local authority had undertaken any housing scheme under conditions laid down by recent Acts of Parliament.

Mr. Chamberlain said that the Ryde T.C. were assisting the erection of houses by private enterprise under the Housing Act of 1923, towards which an Exchequer subsidy of £6 per house for 20 years was payable. Up to the present, 31 houses had been completed. The Council had carried out no other schemes under the Housing, Town-Planning, etc., Act of 1919, and later Acts.

Local Appointments.

Mr. Womersley asked the Minister of Health whether he was aware that a number of local authorities, in advertising appointments under the Rating and Valuation Act, required, *ab initio*, that applicants should be members of the Surveyors' Institution; and whether he would take steps to see that qualified rating surveyors who were members of such bodies as the Rating Surveyors' Association, the Incorporated Society of Auctioneers and Landed Property Agents, or the Auctioneers' Institute, should be afforded an equal opportunity of securing such posts.

Mr. Chamberlain said that under the Rating and Valuation Act, 1925, local authorities were empowered to appoint valuation officers and other officers as they thought fit, and to pay those officers such reasonable salaries as they thought fit. He had no control over such appointments, and he could not, therefore, take any such steps as were suggested.

India House.

Mr. Thurtle asked the Under-Secretary of State for India whether it was proposed that the whole of the £300,000 estimated as the cost of building and fitting the new India House in London would be borne on Indian revenues; and whether, in view of the fact that the commission for the building had been placed in the hands of a British architect, it was intended that an opportunity should be given to Indian artists to take part in the interior decoration.

Earl Winterton said that the answer to the first part of the question was in the affirmative. The scheme for the internal decoration of the building had not yet been settled.

THE BUILDING TRADE

THE LAW OF FIXTURES.—IX

By W. T. CRESWELL, Barrister-at-Law; L.R.I.B.A.; Associate (late Fellow) of the Surveyors' Institution; &c.

TRANSFER OF FIXTURES BY SALE, LEASE, OR ASSIGNMENT.

At Common Law, whether property is freehold or leasehold, the sale of it includes handing over the interest in the fixtures annexed to it, and growing timber on it at the time of the sale, excepting only if there be an express stipulation made beforehand that certain fixtures, etc., shall be, or are, removable; or, again, if there is sufficient evidence of an intention to exclude them from the sale when the agreement for purchase was entered into between the vendor and purchaser; or again, a well-established custom of the particular district concerned might prevail to make them removable in the absence of any express covenant or intention. So much depends on the character of the articles, as being personal chattels or part of the freehold.

Intention of the Parties to the Sale, etc.

The intention of the parties as to what fixtures were intended to pass must, in all cases, be determined from the contract deed conveying the land. If there is no separate detailed mention of the fixtures, the total amount of their value must nevertheless be mentioned and included in the statement of the consideration paid for the land.

If mention is made of fixtures in the deed of conveyance, mere general words will not be construed as including any particular fixtures only, but will apply to the whole of them; and if the deed enumerates any specific articles, and not other fixtures actually on the property, the rule that all fixtures are intended to pass by the conveyance is not thereby rebutted. (See Mather *v.* Fraser, 1856, 2 K. & J. 536, and Haley *v.* Hammersley, 1861, 3 De G. F. & J. 587). On the other hand, the express mention of the exclusion of one thing may be construed as impliedly excluding another thing related to it in some way, which would have passed over under the general terms of the conveyance. In Hare *v.* Horton (1833), 5 B. & Ald. 715, there was a conveyance of an iron foundry and dwelling-houses, etc., with the appurtenances, together with all grates, boilers, bells, and other fixtures in the said dwelling-houses. It was held that fixtures in the foundry which comprised *inter alia* cranes, presses, and a steam engine, and which were used for the business carried on in the foundry, were not included, nor could they be impliedly counted in with fixtures expressly mentioned in connection with those passing with the dwelling-house. (See also Trappes *v.* Harter, 1833, 2 C. & M. 153.)

Valuation of the Fixtures.

Both in private sales and sales by auction, it is customary to state the price at which the fixtures and timber are to be taken, or that they are to be taken at a valuation in some particular manner, or, failing that, then at a fair price or valuation. In this last case the Court can direct a reference to ascertain the price; otherwise, the valuation must be made in the specified manner or the Court cannot interfere in that this would be setting up a new contract between the parties. (See Wilks *v.* Davis, 1817, 3 Mer. 507, and Morgan *v.* Milman, 1853, 3 De G. M. & G. 24.)

If a landlord covenants with a tenant to take over the tenant's fixtures at a valuation, at the end of or at any time during the term, the valuation is a condition precedent to completion of purchase, which must be performed. And if, for instance, the landlord has covenanted to arrange for the valuation, he must do so punctually; otherwise the contract is voidable and the ordinary rules obtain.

Removal of Fixtures.

It has been previously stated that a tenant fixing tenant's fixtures during the term must remove them during the term, or during any extended period in which he has gained a right to consider himself the tenant. It would appear that in the event of his purchasing articles belonging to the landlord and annexed to the premises demised, his right to remove them (which arises solely out of the contract) would be similar, *i.e.*, he must remove these also during the term, and his right of removal is lost at the end of the term or further period in which he is entitled to be regarded as the tenant. It follows that if at any time a tenant wishes to renew his lease of the same premises, he must be careful to reserve to himself the right of removing the tenant's fixtures concerned under the old lease; or he may, without such precaution (and not having detached them during the first period of tenancy) lose his interest in them altogether with the fulfilment of the first lease.

The acceptance of the lease of a house containing fixtures, if there is no covenant concerning them, does not raise an implied contract by the tenant to pay for such fixtures and, further, the landlord cannot remove such fixtures during the term against the will of the tenant, who is entitled to their use during the whole of his tenancy. (See Goff & Harris, 1843, 5 M. & Gr. 573.)

If a tenant agrees to sell tenants' fixtures to his landlord, such agreement need not be in writing in order that he may successfully secure the value of them, since the sale is not one of an interest in land. It is, in effect, a mere renunciation of the tenant's right to removal. (See Lee *v.* Gaskell, 1876, 1 Q.B.D. 700; and Halien *v.* Rundell, 1834, 1 Cr. M. & R. 266.)

Further, a reversionary interest in trade fixtures can pass to a purchaser under a parol agreement only. (See Petrie *v.* Dawson, 1845, 2 Car. & K. 138.)

Assignment of Lease.

Generally, the assignment by a leaseholder of all his interests in the lease of a property also includes the yielding up of their interests in the fixtures annexed to the property. It is an assignment of his right of removal, as above referred to, in that, at law and in equity, no person can acquire from another a better title or a greater right to anything than the right the other already possesses.

Stamping of Documents.

A transfer of fixtures includes a transfer of the right of severance of the same; and, whether a memorandum of the sale of fixtures does or does not transfer any interest in the chattels themselves, the conveyance comes within the Stamp Acts and requires a conveyance stamp. (See Horsfall *v.* Key, 1848, 17 L.J., Ex 266.)

STATUTE LAW.

Fixtures Included in a Sale, Lease, Assignment, or Mortgage of Land.

Section 62 of the Law of Property Act, 1925, repeats section 6 of the Conveyancing Act, 1881. Under this section, a conveyance of land is deemed to include, and under the Act to convey with the land, all buildings, erections, fixtures, commons, hedges, ditches, fences, ways, waters, watercourses, privileges, easements, rights, and advantages whatsoever appertaining (or reputed to appertain) to the land, or any part thereof, at the time of the conveyance. Also, a conveyance of land, having houses or other buildings thereon, is deemed to include, and under the Act to convey with the land, houses, or other buildings, all out-houses, erections, fixtures, cellars, areas, courts, court-yards, cisterns, sewers, gutters, drains, ways, passages, lights, watercourses, liberties, privileges, easements, rights, and advantages whatsoever appertaining (or reputed to appertain) to the land, houses, or other buildings conveyed, or any part thereof, at the time of the conveyance.

The section applies only if, and as far as, a contrary intention is not expressed in the conveyance, and has effect subject to the terms of the conveyance and to the provisions contained therein.

Rules as to Ascertaining Intention as to Time when the Property in Fixtures Passes.

Under section 18 of the Sale of Goods Act, 1893, unless a different intention appears, the following are rules for ascertaining the intention of the parties as to the time at which the property in the goods is to pass to the buyer:—

(1) When there is an unconditional contract for the sale of specific goods, in a deliverable state, the property in the goods passes to the buyer when the contract is made, and it is immaterial whether the time of payment or the time of delivery, or both, be postponed.

(2) When there is a contract for the sale of specific goods and the seller is bound to do something to the goods for the purpose of putting them into a deliverable state, the property does not pass until such thing be done, and the buyer has notice thereof. So the property in fixtures (of the character of goods which are to be delivered by the seller "free on rail") only passes to the tenant removing them when they have been detached and sufficiently dismantled to be in a deliverable condition.

In Underwood, Ltd., *v.* Burgh Castle Brick and Cement Syndicate (1922), 1 K.B. 343 the owners of a horizontal condensing engine which was a trade fixture, and removable, agreed to sell it at a price free on rail in London. It weighed 30 tons and was bolted to and embedded in, a flooring of concrete, from which it had to be detached and dismantled before it could be delivered on rail. The sellers detached it, and in loading it on to a truck they accidentally damaged it and the buyers refused to accept it. The sellers thereupon brought an action for goods bargained for and sold, and it was held that the property in the engine had not passed to the buyers, in that the sellers were bound to do something which they had not done for the purpose of putting the engine into a deliverable state; and that all the circumstances showed an intention that the property should not pass until the engine was placed in safety on rail in London.

Hereford Hospital: Extension Scheme.

The Board of Management of the Herefordshire General Hospital, Hereford, has decided to embark on a scheme of extensions which it is estimated by the architects to cost £63,758. The proposed extensions include private patients' home, nurses' rooms, new surgical wings, orthopædic ward, maternity ward, children's ward, isolation ward, new kitchens and offices, pathological laboratory, drainage, etc.

THE REPORT OF THE COMMITTEE ON THE LAW OF ARBITRATION

(Continued from last week's issue.)

The Committee pointed out that there was also a difficulty in deciding whether a case is stated under section 7 or section 19 (Cogstad *v.* Newsum & Co., 1921, 2 A.C. 528) and referred to two other matters, first that under section 19 the Court in ordering a case to be stated has no power to order that it shall be stated in the form of a special case under section 7, and secondly that a case under section 19 is heard by a Divisional Court constituted of three judges taking the Crown Paper, whereas a case under section 7 is heard by a single judge. The recommendations of the Committee were: (*a*) The Court should be given power to order an award to be stated in the form of a special case under section 7 in addition to and as an alternative to, its power to order a consultative case under section 19 (*b*) that the right of appeal from the decision of a case stated under section 7 should remain as at present, and that by leave of the Court which hears a case stated under section 19 or by leave of the Court of Appeal there should be an appeal to the Court of Appeal, but only by such leave and (*c*) that as a matter of practice a case stated under section 19 should be heard like a case stated under section 7, by a single judge.

The Report touches upon the delay that often occurs in hearing special cases, and also points out that it is often the practice in cases stated for the opinion of the Court under section 19 merely to answer the questions put by a mere "Yes" or "No," and suggests that where questions of common forms of contract or recurrent commercial problems are involved a more reasoned answer would be of service to those engaged in trade. The Report then turns to

The Enforcement of Awards.

It is pointed out (paragraph 14) that although by section 12 of the Act of 1889 an award may be enforced in the same manner as a judgment, in practice delay occurs, for section 11 gives the Court power in certain circumstances to set aside an award and by Order 64 rule 14 of the Rules of the Supreme Court an application to set aside an award may be made at any time within six weeks of the publication of the award. The Report states that on an application to enforce the award under section 12 the party against whom it is to be enforced constantly avers that he intends to set aside the award, and in such circumstances it is difficult for the Master to make an order enforcing the award until the fate of the suggested motion is known, and thus a delay of six weeks is secured. The Report also refers to the delay in setting down and securing the hearing of a case stated under section 7 as the practice is that a case can be set down at any time, but is not brought on for hearing until ten days from the date of entry, or six weeks from the date of the award whichever is the later, the object being to give the opportunity for the entering of a motion to set aside the award within the six weeks allowed by the rule.

The recommendations of the Committee to meet the above cases is that the time for moving to set aside an award should be reduced at the least to 14 days, but subject to the power of a Court or a judge to enlarge the time, and that when an application is made under section 12 to enforce the award power should be given to the Court or a judge to order a respondent to give security for the amount awarded, by payment into Court or otherwise, if he seeks to postpone the making of an order until he has moved to set aside the award. But the Report suggests an amendment of section 12. At present a judgment obtained in pursuance of an order enforcing an award is not a final judgment, and consequently a bankruptcy notice cannot be founded on it (*In re* a Bankruptcy, 1907, 1 K.B. 478). The Committee suggest that section 12 shall be amended so as to provide that a final judgment in the terms of the award may be entered, and they expressed a hope that this change may facilitate the enforcement of awards made in England in other countries as possibly an English judgment may be more readily enforced than an order for enforcing an award in the same manner as a judgment.

Minor Matters.

There are many minor amendments recommended by the Report, as, for instance, that section 4 should be amended to include a trustee in bankruptcy and personal representatives so that death or bankruptcy shall not revoke a submission, that an arbitrator shall have power to make an interim award and power to order the delivery of specific goods, and that an award should carry interest, but our space compels us only to allude to one more matter which appears of special importance.

Relief from Submissions Unwittingly Agreed To.

The Report refers (paragraph 33) to many memoranda submitted to the Committee suggesting that statutory power should be given to the Courts to relieve persons from various kinds of hardships imposed upon them by the terms of submissions to which they have unwittingly or unwillingly agreed. The Report gives examples of the hardships referred to. For instance (*a*) that it appears to be increasingly common for forms of contract for the sale of commodities to stipulate in the arbitration clause that a claim for arbitration must be put forward within a limited time or it shall be conclusively barred. Cases are cited, Ford *v.* Compagnie Furness (1922, 2 K.B. 279) (three months); Atlantic Co. *v.* Dreyfus (1922, 2 App. Cas. 250) (three months); Pinnock *v.* Lewis & Peat (1923, 1 K.B. 690) fourteen days); Ayscough *v.* Sheed Thompson & Co. (30 Com. Cas. 23) (three days), and the Committee observe, "Though it might be difficult to show hardship with a limit of three months, it must often be easy if the limit is three days."

(*b*) There used to be a common provision in the arbitration clause in insurance policies that in any event each side should pay its own costs. The Committee believe this is not found usually in new policies but it still survives in old policies.

(*c*) Several correspondents had referred to the common practice by which in building and engineering contracts contractors are required to tender upon and agree to, a form of printed contract by which all disputes are to be decided by an architect or engineer who is in the employ of the other party, and very often one whose own acts or requirements on behalf of his employer may create the dispute which must be referred to his decision.

We have set out this last illustration verbatim from the Report, and it is a point we have frequently drawn attention to, for instance, in our issue August 2, 1912, and more particularly in an article on "The Arbitration Clause in Building Contracts," January 31, 1913, where we explained the reason for the adoption of such a clause but drew attention to the objection of the clause becoming stereotyped and made a condition to the acceptance of tenders. The last example given in the Report was that it is not uncommon for an arbitration clause to provide that in no circumstances shall either party ask for a special case for the opinion of the Court or for the making of an award in the form of a special case.

The Committee recognised that to interfere with the contracts people have made deliberately would be a doubtful policy, and in no case should relief be given to a person who has entered into a submission after a dispute has arisen, but as regards common forms of submission in printed forms, although it was outside their province to make positive recommendations yet they suggested that it might be considered whether provision should not be made as follows (see paragraph 35):—

"(*a*) That where an arbitration clause in a common form of contract provides that a claim shall be barred unless arbitration be claimed within a limited time, it should be open to either party to apply to a judge for an order that this time provision should be enlarged, and that a judge if satisfied that in the circumstances of the case the time limited provided creates an unreasonable hardship shall have power to vary the contract by enlarging the time.

"(*b*) That a provision in the common form of arbitration clause that each side shall pay his own costs shall be void, and that the arbitrator or umpire, notwithstanding such provision, shall have full power to order either party to pay the costs.

"(*c*) That where a particular person has been named or designated in a submission as arbitrator either party may apply to a judge, and if he satisfies the judge that such person by reason of his relation towards the other party or his connection with the subject matter of the dispute may not be capable of complete impartiality the judge if he thinks fit may make an order removing such arbitrator and appointing another in his place.

"(*d*) It seems to be a doubtful question whether a clause that neither party shall ask for a special case is or is not void as being against public policy. If it were desired it would be easy to insert a provision that it is to have no effect.'

On a matter somewhat akin to this the common provision that the obtaining an arbitrator's award shall be a condition precedent to the right to bring an action—the Committee make the suggestion that where a party is charged with fraud he may apply to a judge for an order that the clause as to this issue shall be of no effect so that he may have it determined by an action.

In conclusion of this very imperfect summary of the recommendations of the Committee, we may add that in paragraphs 30 and 31 will be found reasons which made it unnecessary for the Committee to consider the last part of their terms of reference, "the law relating to the effect given in England and Wales to submissions, arbitrations, and awards, made or held elsewhere," although owing to doubts they found widely entertained as to whether a submission made abroad is a submission within the Arbitration Act, they sugest one or two amendments of the Act to clear away such doubts.

Merchandise Marks Act, 1926.

The Board of Trade have referred to the Standing Committee (General Merchandise) applications for Orders in Council to be made requiring indications of origin in the case of:—

(1) Imported brass water taps and other water fittings of brass and brass parts thereof; cabinet furniture of metal (not including locks); furniture castors; electric lamp-holders, wall plugs, switches and similar household fittings and metal parts thereof; brace and belt buckles of metal.

(2) Imported rubber tyres and tubes for motor cars, motor cycles and cycles, and also solid and semi-solid tyres.

Representatives of any interests substantially affected by any of these applications who desire to be heard in opposition are requested to communicate with the Secretary to the Committee, Mr. E. W. Reardon, at the New Public Offices, Great George-street, London, S.W.1, with the least possible delay, and, if practicable, not later than June 24.

RENT RESTRICTION

NOTICE BY TENANT.

An important decision to landlords, under the Rent Acts, has recently been given in the case De Vries *v.* Sparks (*The Times*, April 29) by a Divisional Court. The defendant, who was the occupier of a house upon a weekly tenancy, and had been so for many years, in May, 1926, on the death of her husband and one of her sons, had written to the plaintiff, the landlord of the premises, saying she would give up possession in or about September, 1926. An arrangement was then come to between the parties, the reason of which is not clearly explained in the report. The landlord agreed to pay her £30 for giving up possession, £10 down and £20 on giving up possession, and that she should occupy the house rent free until she gave up possession, and a receipt was signed by the defendant as follows: "May 31, 1926. Received £10 on account of £30 for giving up possession of —— on or before September 25, 1926." The plaintiff had then contracted to sell the house, but the defendant had changed her mind and continued in possession, and this action was brought by the plaintiff to recover possession.

The County Court judge had held that although this agreement was inoperative to deprive the defendant of any of her rights under the Rent Acts, it yet amounted to a notice to quit given by the tenant under Section 4, sub-section (1) (c), of the Rent Act, 1923, which substitutes that section for Section 5 of the principal Act of 1920. This provision is the same in both Acts and provides: "No order or judgment for the recovery of possession of any dwelling house to which this Act applies . . . shall be made or given unless (c) the tenant has given notice to quit, and in consequence of that notice the landlord has contracted to sell or let the dwelling house or has taken any other steps as a result of which he would in the opinion of the Court be seriously prejudiced if he could not obtain possession." The County Court judge had held that the plaintiff would be "seriously prejudiced," and had made an order for possession.

The point before the Divisional Court was whether in the above circumstances the tenant had given "notice to quit" within the meaning of the above section paragraph (c). The tenant here was not a statutory tenant holding over after notice to quit from the landlord, and the Court intimated it was therefore not necessary to consider what kind of notice had to be given by a statutory tenant, and the decision was limited to the notice to be given by a common law tenant such as the defendant was in this case, but it also appears to have been decided that it was only to such tenants that the paragraph applies.

The Court found that there was no notice to quit by the tenant but merely an agreement between the parties that the common law tenancy should determine at the latest by September 25, 1926, and pointed out that an agreement to surrender was entirely different from a notice to quit. The former was an agreement between the parties, whilst the latter was a notice given by one party to the other of an intention to exercise a right given by the contract, whether the other party consented or not. But the Court held that in this case, even if the agreement were treated as a notice to quit, it was invalid on two grounds: (1) Because the notice was not to determine the tenancy at any fixed date; and (2) because there was no evidence to show that the notice expired on the same day of the week as that on which the tenancy commenced.

In the course of the hearing a case was brought to the notice of the Court—Gilbert *v.* Jordan (*Weekly Notes*, August 14, 1920; The Builder, August 27, 1920)—in which a Court of first instance had treated some negotiations between the parties as a notice to quit under Section 5, sub-section (1) (c), of the Rent Act, 1920. In that case the tenancy would expire on May 9, 1920, and the plaintiff, who had purchased the house on March 15, 1920, had written to the tenant asking him if he was arranging to vacate the premises when his tenancy expired. The tenant had replied that the premises would be given up "at the time and to the person legally entitled," but had added that it would be a convenience to him to remain until June 24. The plaintiff had assented to this, and on the faith of the undertaking that the tenant would vacate the premises had sold the premises with vacant possession on June 24 to a third party. Subsequently the tenant had refused to give up possession and on action brought the Court had treated the tenant's expression of an intention to leave as a notice to quit under Section 5 (c). It appears that in the case we are considering the Court disapproved this decision, and the case must therefore no longer be considered law, as the Divisional Court is a superior Court.

It may be doubted whether it has been appreciated by landlords that when a tenant gives notice of his intention to determine his tenancy under the above section of the Rent Act the ordinary rules as to notice apply. In our issue for June 20, 1924, we set out those rules as derived from the decided cases, and in the case of Queen's Club Gardens Estates, Limited, *v.* Bignell (1924, 1 K.B. 117) it was held in the case of weekly tenancies that the notice must be a week's notice expiring at the end of the week, but the matter was carried a little farther in the very recent case Newman *v.* Slade (1926, 2 K.B. 328; The Builder, June 25, 1926), where it was held that a week's notice did not mean seven clear days, but a calendar week's notice given on the day corresponding to that on which the tenancy commenced, unless a contrary intention appeared in the agreement That is, if the tenancy commenced on a Monday, a notice given on Monday for the following Monday is a good notice.

Drawn Steel Reinforcement Bars.

The revision of the British Standard Specification, No. 15, 1912, Structural Steel for Bridges and General Building Construction, has been engaging the attention of the British Engineering Standards Association for some time past, and at the instance of the Institution of Structural Engineers, it has been agreed that consideration shall be given to the preparation of a B.S. Specification for Drawn Steel Bars for Reinforced Concrete Construction, which have not, up to the present, been dealt with by the Association.

New Road for Nottingham.

A start has now been made with the new trunk road which will go through a portion of the eastern part of Nottingham linking up Lower Parliament-street with London-road. The new thoroughfare will have a uniform width of 70 ft., and starting from a point near the centre of the city, will have, among other advantages, the clearing away of nearly 300 slum dwellings. The entire cost of the scheme, which will not be completed for two years, will be at least £200,000.

Bradford Improvement Scheme.

Bradford has decided to make a start upon the remodelling of its central area. The city council has decided to apply to the Ministry of Health for powers to borrow £230,000 in connection with one site, and also that the *Telegraph* buildings in Market-square should be acquired. The whole of a triangular site of 22,464 square feet, abutting on to Town Hall-square, has become Corporation property, and the city architect, Mr. W. Williamson, completed, some time back, plans for the erection thereon, at a cost of £230,000, of a big block of buildings six stories high, with shops occupying the ground floor. The Council has now sanctioned the scheme.

NEW BUILDINGS IN LONDON

Ealing. — School. — The Middlesex County Education Committee are considering the acceptance of the tender of Messrs. Leslie & Co., of Kensington, for the erection of a new technical and art school at Ealing for the County Council. Mr. H. G. Crothall, F.R.I.B.A., County Architect, 87, Tufton-street, S.W.1, has designed the plans. The price of the tender is £28,100.

East London. — Improvements. — Messrs. Samuel Instone and Co., Ltd., the colliery proprietors and shipowners, have concluded an agreement with the L. and N.E. Railway to lease the Thames Ironworks for a number of years.

It is understood that the site will be equipped with up-to-date wharves, docks, warehouses and transit sheds.

Eltham.—Premises.—The Royal Arsenal Co-operative Society have purchased the Eltham Conservative Club, and propose to convert the premises into shops.

Gracechurch-street.—Premises. — Messrs. Campbell Jones, Sons, and Smithers, 9, Dowgate-hill, Cannon-street, E.C., are the architects for the new premises about to be erected at 30, Gracechurch-street, E.C. Messrs. Howell J. Williams, Ltd., 11-17, Bermondsey-street, S.E.1, are the builders.

Hendon. — Hospital. — Tenders are now being invited for the erection of an isolation hospital of 60 beds, comprising administrative block, three ward pavilions, observation wards, laundry, boiler-house, etc., mortuary and lodge, at Goldsmith-avenue, Kingsbury-road, N.W.9. Mr. A. O. Knight, engineer and surveyor to the Hendon Urban District Council, has prepared the plans. The quantity surveyors are Messrs. L. A. Francis & Sons, Vernon House, Sicilian-avenue, W.C.1.

Hoxton.—Flats.—The London County Council are to erect three blocks of flats at Hoxton, to the plans of the Chief Architect. The flats are to cost about £29,560.

New Malden.—Buildings.—The scheme for a central sports ground and a boat-house for the University of London, has been started. A freehold site has been obtained at Motspur Park, near New Malden, at a cost of £18,000. It consists of 28 acres of grass land and includes a building which can be adapted for a clubhouse. Two acres of land at Chiswick, with a river frontage of 255 ft., have been bought for £4,000 as a site for the boat-house.

It is estimated that the initial outlay for building, levelling, equipment, etc., will amount to about £22,000.

Old Bond street.—Reconstruction.—The Embassy in Old Bond-street is shortly to be reconstructed and redecorated. The architect's plan for the new room promises an enormous improvement. Mr. J. A. Eshelby, 6, New Burlington-street, W.1, architect.

Stratton-street.—Premises.—Messrs. Perry & Co. (Bow), Ltd., are the contractors for the new building being erected in Stratton-street, W. Mr. J. Ernest Franck, F.R.I.B.A., is the architect. Messrs. Young & Co., 6, Queen Anne's-gate, S.W., are supplying the structural steelwork.

Stoke Newington.—Baths.—The Stoke Newington Borough Council are considering a scheme for the erection of new swimming baths on a site at 203-205, Albion-road. The plans have been by Messrs. Hobden and Porri, architects, 37A, Finsbury-square, E.C.2, and Messrs. E. G. Browning and Sons, of 37A, Finsbury-square, are the quantity surveyors. The whole scheme is estimated to cost £16,500.

Wembley.—Studio.—Arrangements are in progress for the purchase of freehold property formerly part of the grounds of the British Empire Exhibition for the establishment of a film studio.

A sum of £147,500 is the agreed purchase price for the site. Mr. Rupert Mason and Mr. Ralph Pugh, joint managing directors of British Authors Productions, Ltd., are connected with the scheme. A certain amount of reconstruction work will be necessary.

CONCRETE COTTAGE CONSTRUCTION

A new system of concrete cottage construction, invented by Mr. James Cramer, F.S.I. of Manchester, adopts the pier-and-panel method, and the main object has been to devise a shuttering, both simple and cheap, by means of which cavity walls can be built with the use of "poured-in concrete," or "Gunite" (the latter being cement applied by mechanical power). This is claimed to be accomplished by the "collapsible cavity shutter and the climbing shutter" "poured-in" system, while in the "Gunite" system the collapsible cavity shutter only is used.

In the "poured-in concrete system" concrete piers are erected (reinforced with steel rods if required) formed of hollow blocks filled with poured-in concrete, as the work proceeds; the blocks are grooved on outer edges in contact with the panels to enable the panels to key into the piers. The heads of the piers are tied together by a continuous reinforced concrete eaves beam. The poured-in concrete wall panels are formed by means of two sets of shuttering known as (1) the collapsible cavity shutter, and (2) the climbing shutter.

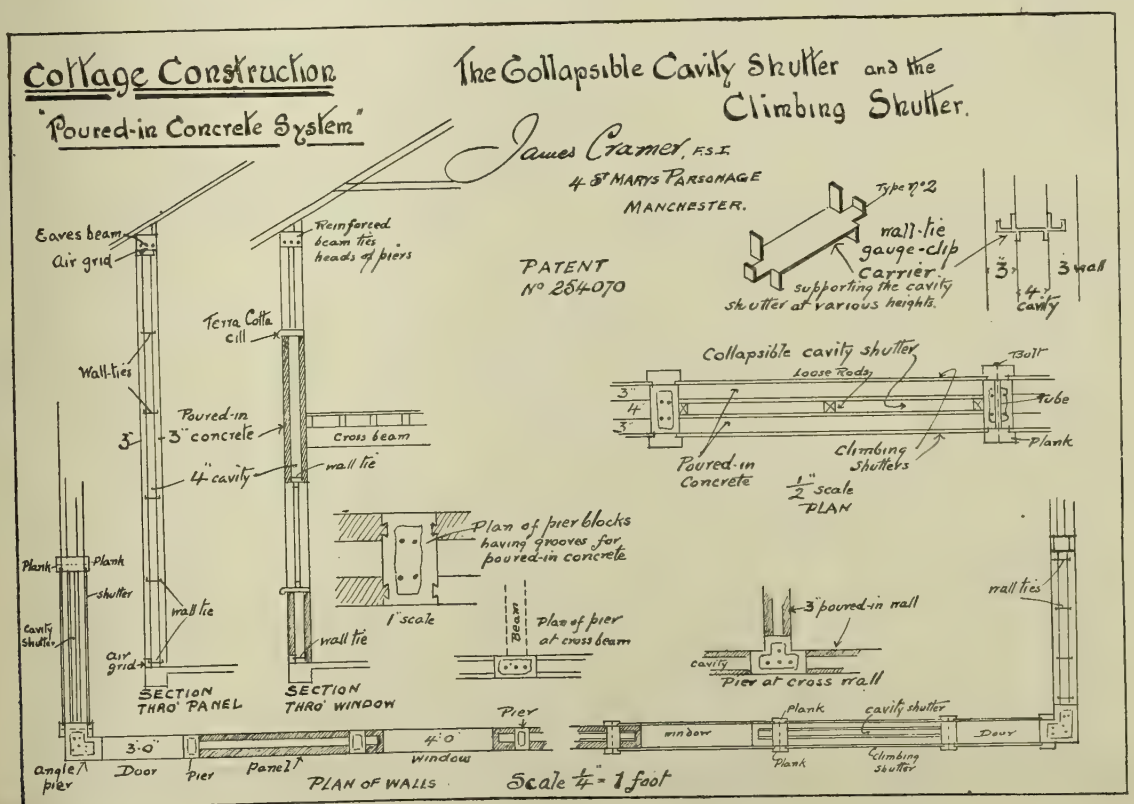
The collapsible cavity shutter is made of timber formed of two leaves and has loose central rods, the leaves being kept apart by the rods, and held together by metal clips of three patterns. Pattern No. 1 is used on the ground level only, being so shaped that it forms a wall-tie and a gauge clip. Pattern No. 2 is used at any level above the ground, and forms in addition a carrier for the shutter, as it is set at the various heights. These two clips remain (on the withdrawal of the shutter) embedded in the concrete tying the inner and outer walls together. In every case where the shutter is reset new wall-tie clips are required and they can be set at any height and any distance apart. Pattern No. 3 is a simple clip holding the head of the two leaves of shuttering together; it is detachable and is used over again. The length of the clips determine the gauge of the cavity.

The overall size of the shutter is arranged to suit the position and number of door and window openings required. The contact face of the shuttering with the concrete is coated with bituminastic paint to facilitate withdrawal. The cavity shutter forms the cavity and determines the inner face of the poured-in panel wall.

The climbing shutter is formed of timber planks and shutters which form the outer faces of the poured-in concrete panel walls. The concrete pier blocks are prepared with metal tubes set in same at various heights to receive a bolt passing through to secure the temporary planks. The planks are bolted to the piers and are rebated in the edges to allow the shutter to slide to any height following the cavity shutter; the loose shutter is placed in position with its edges bearing on the concrete piers and is tightened up to same by means of set screws passing through the edges of the planks; the shutter can be raised to any height and set to level by means of an adaptable screw.

The two sets of shutters being placed in position, the concrete is poured into the spaces between, to form the walls. When the concrete is set the shutters are detached, raised, and reset at a higher level, and the pouring-in process continued. On completion of the walls, the whole of the shutterings are available for the next house, and it is estimated that the life of the cavity shutter is at least 10 houses and that of the climbing shutter 50 houses. It is estimated that the cost of all shutterings will not exceed £10 per house.

To build a house on the "Gunite" system the cavity shutter only is required. The same types of wall-tie-gauge clips are used and for the same purpose, but with the following exception. The head clips are so made that they support rods or carry metal fabric suspended on the face of the shutter against which the "Gunite" is projected, forming the walls. The wall-ties again become permanent, tying the walls together. As only the cavity shutter is required, it is estimated that the cost will not exceed £5 per house.



Specification for Dimensions of Rivets.

The British Engineering Standards Association has recently published a British Standard Specification (No. 275, 1927) for the Dimensions of Rivets. This specification, which is intended to meet the requirements of structural work (other than boilers), gives the standard diameters for rivets from ½ in. to 1¾ in. inclusive, the manufacturing tolerances on the shanks, and the standard proportions for snap, pan, and countersunk rivet heads. For the sake of clearness, sketches are included showing how the tolerances are disposed in the case of (a) rivets up to 5 diameters long, and (b) rivets of greater length. The material for steel rivet bars has already been standardised by the Association in the British Standard Specification dealing with structural steel for shipbuilding, railway rolling stock, and bridges and general building construction.

This specification takes the place of Appendix 7, which it was proposed to issue in connection with B.S. Specification No. 153, Parts 1 and 2, 1922, for Girder Bridges. Copies may be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria-street, S.W.1, price 2s. 2d., post free.

The Importation of Foreign Granite.

The effect of the importation of foreign granite on employment in the area has been considered at a conference of a sub-committee of the Aberdeen Employment Committee and members of the Aberdeen Granite Manufacturers' Association. Professor A. Gray, chairman of the Employment Committee, presided. The proceedings were in private, and at the close it was reported that, after consideration of the information available, it had been agreed that the Aberdeen Granite Manufacturers' Association should receive the full support of the Employment Committee, and that they should join issue to obtain the results desired. It was learned from a granite merchant that manufactured granite in the form of polished tombstones is being landed in England to the value of about £14,000 per month. Aberdeen's most formidable competitors are Germany and Finland. So far as Scotland was concerned, only about £200 worth of tombstones were imported, and this was due to the fact that in Scotland it had been agreed in the trade not to handle foreign granite. It was suggested that granite should come under the Foreign Merchandise (Marks) Act, so that the origin of the goods should be made known

(For rates of wages in the Building Trade in Scotland, see page 1034.)

PRICES OF BUILDING MATERIALS

THE report of the Chairman of the Inter-Departmental Committee appointed to survey the prices of building materials has been issued for the period up to May, 1927 (H.M. Stationery Office, price 4d. net). In the course of his introductory note, the chairman (Mr. John W. Hills) remarks that examination of the schedule suggests that prices are tending in several directions to become easier. At the same time it should be noted that as from February 1 last, railway rates in respect of merchandise traffic have been increased, with a resultant increase in the prices of bricks and other commodities in districts where they are not produced locally.

For the purposes of comparison the schedule includes also the prices for April, 1914, and January, 1924.

Dealing with specific materials, the following observations are submitted :—

Bricks.—The movement downwards in brick prices which was recorded in the report for February has since continued; prices have in most districts now fallen to the level of a year ago.

Portland Cement and Lime.—In some districts the prices of these articles have fallen somewhat.

Timber.—The tendency of timber to rise, which was noted in the last report, has not been maintained, for several correspondents now report reductions in all three varieties specified, viz., *carcassing, joinery and flooring timber*. In some cases the price of *plasterers' laths* has also fallen.

As regards *roofing tiles*, it is understood that in January last manufacturers who are members of the National Tile Association took off increases which had been imposed the preceding November. This reduction does not, however, appear to have yet become operative throughout the country, seeing that the prices reported from such widely distant localities as Willesden, Bristol and Manchester are still higher than in May last.

In some districts *slates* are reported to be available at lower prices. The decline in the prices of *lead* continues.

Glazed Ware.—While in a few districts the price of *W.Cs.* has fallen since February this article still costs more in most districts than before the coal stoppage. As regards *sinks*, however, the decline in price has been more general.

Cast-Iron Goods.—Some reductions are reported in the price of R.W. pipes and gutters and soil pipes, but such reductions have not yet become of general application.

Glass.—Some correspondents report slight movements in the price of glass, the movement being upwards in some cases and downwards in others.

The price of *turpentine* has generally fallen.

Improvement of St. Helier Harbour.

The Jersey States have approved plans for the improvement of the harbour of St. Helier at an estimated cost of £250,000. The harbour mouth is to be widened, and the interior dredged to afford better swinging room for vessels. Work will be begun almost at once.

Midland Building Trades Exhibition.

This exhibition will be held at Bingley Hall, Birmingham, from September 5 to September 17 next. The Birmingham Chamber of Commerce is again the organising body, and the council of the exhibition has undertaken the provision of stands on hire, fitted and erected. Conferences will be held on the most recent developments in the building and allied trades. In this connection, particular attention will be paid to the effect of the reduced Government subsidy on housing. Discussions will also take place on lighting, cooking, heating, electricity services, hot-water provision, and kindred subjects.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations :—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING, ETC.

JUNE 27.—**Banchory.**—HOUSES.—Six blocks of two houses, at Hillhead of Arbeadie, for T.C. B.S.

JUNE 27.—**Bradford.**—REMODELLING.—Following work required at various schools, for the E.C.: (1) remodelling conveniences (whole trade tender); and (2) colouring, &c.

JUNE 27.—**Camberwell.**—DWELLINGS.—Erection of block on a site at Comber-gro., for the L.C.C. Architect to the Council, The County Hall (Room, No. 3), Westminster Bridge, S.E.1. Dep. £2 to the cashier.

JUNE 27.—**Dublin.**—BUILDING.—Boys' Chapel at the Catholic University School, Lower Leeson-st., Dublin, for Rev. P. Lawless. Thomas J. Cullen, architect, 25, Suffolk-st., Dep. £3 3s.

★—**Weston-super-Mare.**—Junior Account and Costing Clerk required in the Stores Department by the U.D.C. Harold A. Brown, Engineer and Surveyor, Surveyor's Office, Weston-super-Mare.

INSTITUTION OF WATER ENGINEERS

The summer meeting of the Institution of Water Engineers was held at Scarborough, when Dr. Herbert Lapworth, D.Sc., was elected president. Over 100 members were present. A paper was read on Scarborough waterworks by Mr. Herbert Richardson, the water engineer of the borough, and Dr. Lapworth, who is consulting engineer to the Corporation, dealt with the extension scheme now in progress, which is estimated to cost £110,000. The geology of the Scarborough district was described by Mr. R. C. S. Walters, B.Sc.

The president's premium of £10 was presented to Mr. W. E. W. Millington for a paper on "Some Metallurgical Problems of the Waterworks Engineer." The institution premiums of £5 were awarded to Mr. J. P. Hallam, Manchester, for a paper on "Recent Developments in the Design and Application of Centrifugal Pumps," and to Mr. E. J. Silcock for a paper on "The History of the Artesian Borehole."

Dr. Lapworth moved a vote of thanks to Mr. Lewis Holme Lewis, the retiring president, who was absent through illness. In his presidential address he said the institute continued to expand, and by an increase of 32 during the year the membership had reached 479, which was the best yet attained. It was generally accepted, he said, that an education in the scientific principles of their profession was an essential first stage, but in regard to subsequent practical training necessary to equip a young engineer for a post as assistant, he considered that in view of the accelerated output of candidates required to make good the wastage of war years, one year's pupilage after obtaining a recognised engineering degree should be sufficient equipment for certain junior posts. On public works there were openings for junior assistant resident engineers who could efficiently use a level and theodolite, plot an accurate section or survey, take out single quantities, and make a reasonably clear drawing.

A Trade Dividend.

Messrs. Brook & Quittenton, Ltd., builders' merchants and ironmongers, of Coulsdon, announce, after proper provision for depreciation and reserve, a dividend of 12½ per cent. per annum has been paid for the year ended March 31, 1927.

NOTES ON CONVEYANCING.*

THE author in his introduction to this little volume states that it is not intended as an exhaustive commentary on the new Conveyancing Acts, but merely as notes of the most important points likely to be met with in every-day experience in connection with the Acts with some few other observations not exactly bearing upon the Acts. When we state that it consists of 195 pages of large print, including the index, it will at once be grasped that it does not pretend to be an exhaustive treatise on those statutes which now bulk so largely in the Statute Book. The author expresses the view that the Acts are not so formidable as many people have represented, and he certainly approaches them in a light-hearted spirit, and sometimes half jocosely, and he does not refer to the sections of the Acts upon which his observations are based, as he says the insertion of the sections seems to him "rather to retard the reading unless it be a matter of a controversial nature when it is desired for the reader to form an opinion." It must be admitted that this detracts from the value of this volume in our eyes, as the reader can never accept any statement in a text-book as gospel, and a reference to the section which supports an assertion appears to us essential. In these circumstances we cannot profess to express any opinion on the accuracy of the statements contained in the text, and all we can say is that some hints on an extremely complex subject may be found in the chapters, each of which deals with a separate subject, such, for instance, as "Contracts," "Requisitions on Title," "Easements," and so on; but they will probably be of more service to one having some experience in conveyancing than to the ordinary layman. If, however, anyone desires to get an idea of the general operation of the new law, this very small volume with its clear print will enable him to see many of the points it touches and how they are dealt with, with very little expenditure either of time or money.

Shanghai Public Works Report.

We have received the Annual Report, 1926, of the Public Works Department of the Shanghai Municipal Council, from which we see that municipal affairs in the town have, in so far as public works are concerned, progressed very much as usual. No trouble has been experienced during the year so far as direct labour is concerned, but the practice of sub-letting contracts to inexperienced contractors has been a fruitful source of trouble. The year saw a continuance of considerable building activity, and large blocks of Chinese houses continued to be built, the net increase of Chinese houses and shops in the Settlement being 2,104. There is yet, however, a shortage of at least some 2,500 simple dwellings.

"The Roadmaker."

The June number of this journal, which is issued by the British Reinforced Concrete Engineering Co., Ltd., Smith-square, S.W.1, contains a contribution from Mr. T. B. Cooper, B.Sc., A.M.I.C.E., on "Glorious Devon." He says: "The delicate colours of the Devon valleys and hills in the winter are indescribably lovely. The summer tourist never sees them, as they are hidden or absent when the trees are in leaf. Moss and lichens, tiny individually, when multiplied by millions provide the most wonderful gradations of yellow and green. The winter frosts make fascinating pictures as they melt in patches where the sun strikes and the faint mists rise."

Mr. Edward Willis, M.Inst.C.E., etc., writes on "Some Anomalies," being an article on the trials and troubles of the surveyor of highways. The journal will be sent to all interested upon request.

* *The Conveyancer's Notebook*, being a Résumé of the Chief Points arising under the recent Conveyancing Acts, and General Suggestions on Conveyancing. By A. H. COSWAY. London: Effingham Wilson. 1926. 5s. net.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County-Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

Alfreton.—Site been secured by Primitive Methodist authorities for church, which will have a clock tower, new Sunday schools, a manse and 5 shops. The scheme is estimated to cost £30,000.

Armagh.—City Council is to apply for sanction to £16,000, for installation of electricity.

Athy.—Kildare C.C. granted the Board of Health permission to borrow £53,600 for provision of sanitary works in County Home.

Barmouth.—U.D.C. granted the request made by Board of Trade Marine Department for a piece of land near the Barmouth foreshore for the erection of a look-out station for the Cardigan Bay coast.

Barnsley.—Corporation proposes to erect further 500 houses in Burton Garage district.—M.H. approved B.G. proposals for casual ward at institution at £1,350.

Bedford.—T.C. passed plans 2 pairs of houses, Ampthill-rd., Elstow, Valentine & Ashby.

Birmingham.—The B.G. are to erect single story night nurse's homes at Monyhull Colony at £9,000.

Birr.—Commissioner for County Offaly has expenditure of £120 on alterations at old Bridewell, Birr, for converting it into a store.

Bristol.—Plans been approved for extension of St. George Hall Picture House, St. George. Plans for new building give accommodation for about 920 persons, including a balcony for 240. Architect is W. H. Watkins.

Burham-on-Sea.—Somerset C.C. has prepared a scheme, and approved plans, to erect a court-house in connection with the new Police station.

Cadishead.—A new church is being built at Cadishead, at a cost of £17,000.

Cambridge.—T.C. passed plans:—Pavilion, Westrd., W. F. Reddaway; garages, Newmarket-rd., Hudson's Cambridge and Pampisford Breweries, Ltd.; parochial hall, Blinco-gr., Churchwardens of St. John's Church; garages, Castle-st., Master and Fellows of Clare College.

Colne.—T.C. are contemplating further 100 houses on the Holme Farm estate.

Cookstown.—R.D.C. signed application for sanction to a loan for 86 labourers' cottages.

Cosham.—Libraries and Museums Committee propose purchasing a plot of land on Spur-rd., Cosham, as site for library.

Crediton.—R.D.C. decided to apply to M.H. for £5,244 17s. 8d., for houses at Cheriton Fitzpaine, Yeoford and Poughill.

Driffield.—Managers of the Driffield church schools decided to spend £2,000 upon improvements.

Farsley.—Plans have been prepared for extensions to Fleece Hotel for J. Tetley & Sons, Ltd. Architects, Kitson, Parish & Ledgard, of Leeds.

Ferry-Fryston.—Plans are to be prepared for chapel at the Ferrybridge new cemetery for U.D.C. R. A. Easedale & Sons, of Castleford, architects.

Fleetwood.—Church is to be erected for the Reformed Episcopal Church members to cost about £3,000.

Fylde.—R.D.C. J. Gregson & Sons.—6 pairs of villas, Joyce-av., Marton; H. Eckersley, 2 houses, Clifton-rd., Marton; Watson & Myerscough, pair of bungalows, Lomond-av., Marton; T. Edsforth, 4 houses. Hardhorn.

Grimethorpe.—Parish Council are urging the R.D.C. to proceed immediately with 100 additional houses.

Huddersfield.—C.B. passed plans for an open-air school, Woodhouse Hall, off Woodhouse-hill, for E.C.

Hull.—Scheme been approved for extensions to Central Library at £14,000.

Isleworth.—It is proposed to erect Conservative club.

Keswick.—U.D.C. has purchased the former Midland Bank premises in Main-st., at £2,500 as a site for a new town hall.

Lexden & Winstree.—R.D.C. received M.H. sanction to erect 50 houses.

Liverpool.—Plans and suggestions for school for St. Hugh's have been submitted by managers to E.C., which has forwarded them to B.E.

London (Acton).—B.C. passed plans:—H. Wesley, transformer house and garages for Thomas & Sons; J. A. Perriss, 14 houses, Lexden-rd.

London (Blackheath).—Lewisham B.C. have passed plans for 4 houses at Love-la., for F. T. Bush.

London (New Cross).—Mr. Gordon Allen, F.R.I.B.A. 435, Strand, W.C.2, has prepared plans for large saw sheds at Archangel Wharf.

Margate.—T.C. passed plans:—Six houses, Tivoli Park-av., H. Peall; 2 houses, Kent-rd., Peall & Co.; 2 houses, Wellis-gdns., A. C. Belchier; 6 houses, All Saints'-av., W. B. Wilkins.

Matlock.—Wesleyan Methodist authorities acquired Willersley Castle, which they propose to adapt as a holiday home.—Presentation Nuns have acquired Chesterfield House, which it is proposed to convert into a boarding and day school.

Mytholmroyd.—U.D.C. passed plans for erection by private enterprise of 43 houses.

Nelson.—Ministry of Labour decided to erect Employment Exchange on a site at Bradley-rd.

Newcastle.—Communications received from the Town Clerk by E.C., referred to proposed site for new schools at High Heaton and Cowgate. In regard to the former the Housing Committee drew attention to land immediately north and adjoining the estate as eligible for their requirements. In regard to Cowgate the Housing Committee resolved that, subject to the Council sanctioning the purchase of land east of Two Ball Lonnen for housing purposes, the housing architect be instructed, in consultation with the Education Committee and officials, to make provision in the lay-out for a site for a school.

Newport.—The C.B. proposes to apply for sanction to borrow £4,200 for the erection of a handicraft and domestic subjects centre at Durham-rd school.

Newport (Mon.).—C.B. passed plans: Queens Hill-cres., 4 houses, J. J. Partridge; Coleridge-rd., 2 houses, Harris & Berry; Crawford-st. Ext.: 13 houses, L. & H. Gibson; Shelley-rd., 4 houses, J. G. Dowden & Sons.

Portsmouth.—T.C. passed plans:—F. J. Spickernell, cinema, Bradford-rd., Junction; J. A. Rihoy, six houses, Ranelagh-rd.; A. Dye, lock-up garages, Ophir-rd.; W. Thorp, 7 houses, Stubbington-av.; A. J. Chase, 4 houses, Kirby-rd.

Richmond (Surrey).—T.C. passed plans:—R. Wingate, six houses, 42-52, Marksbury-av.; G. G. Macfarlane, seven houses, Manor-gr.

Richmond.—Important building scheme is being undertaken by the Army, Navy and Royal Air Force Board of the Wesleyan Home Mission Committee at Catterick Camp, where a new chapel is to be built for Wesleyan soldiers to seat 420. Cost £10,000.

Rustington.—Scheme is in hand for permanent hall for village on the new recreation ground.

St. Ives.—T.C. passed plans for new offices on Quayside, for Cranfield & Wheeler.

Salford.—City C. are to purchase from Markham, Heywood & Co., Manchester, about 30¾ acres of land situate at Lancaster Road, Pendleton, as site for houses.

Sheffield.—Catholic Congregation acquired site on Manor estate for Church and Sunday Schools. New day schools are also to be erected and Canon Dolan, who has the scheme in hand, estimates the cost at £10,000 for a building to accommodate 400 children.—The District Wesleyan Home Mission Committee approved provisional plans for Wesleyan Church on the Manor estate at £10,000. The Bints Green Trustees are appealing for funds for Chapel.

Snapethorpe (Wakefield).—City Council decided to make application for sanction to borrow £79,750 for 150 houses, and £1,160 for erection of 2 houses on the Phormium system.

Standish.—U.D.C. passed plans: cinema and two lock-up shops in High-st., E. Bentham; cinema adjoining 28, Preston-rd., J. R. Horrocks.

Stockton.—Funds are being raised for new parochial hall for St. Thomas' Church at £6,000.

Stretford.—Plans passed by U.D.C. include 8 houses, Great Stone-rd., for W. R. Rochell; Secondary school, Great Stone-rd., for the Lancashire E.C.; Elementary school, King's-rd., for the Stretford E.A.; Works, Talbot-rd., for Leyland & Sons; Additions to works, Westinghouse-rd., for Courtaulds, Ltd.

Sutton (Surrey).—"Site been secured near junction of Brighton and Banstead-rds., for Sutton hospital with 62 beds.

Thames Ditton.—Plans of 19 detached houses to be erected on the Imber Grove estate, have been approved by the U.D.C.

Thurles.—Inquiry has been held into petition by U.D.C. to acquire compulsorily certain lands for 11 houses and borrow £5,415 for purpose.

Thurnscoe.—Parochial Council are proposing to make extensions to the Parish Church.

Titchfield.—Fareham R.D.C. has decided to purchase land as housing site, and to invite tenders for 36 houses.

Wakefield.—Plans have been prepared for hotel at Batley-rd., for Springwell Brewery Co., Ltd. Massie & Holdsworth are architects.—Workshops for J. Rhodes & Son are to be erected in Elm Tree-st. R. Goodworth, architect.

Walton.—U.D.C. passed plans: Amalgamated Dental Co., Ltd, additions to factory Churchfield-rd.; Nightingale & Pryor, 2 houses, Russell-rd.; H. Buchan, 3 houses, Sunbury-la.; E. Wright, 26 houses, The Chestnuts estate; Nightingale & Pryor, 3 houses, Russell-rd.

West Hartlepool.—T.C. passed plans. T. Whitear, three pair semi-detached houses, Grantham-av.; the Exors. of G. Willson, lay-out plan of new street, Furness-av., and Stockton-rd.; G. E. Potter, Ltd., premises, office, joiner shop, and machine shop, Burn-rd; T. Whitear, 21 garages, Grantham-av., and Eltringham-rd.—The T.C. has approved the following plans: J. Longmore, detached house (subsidy plan), Beachfield-drive; Sir William Gray, Bart., detached house and drains, Park Estate.

Whitehaven.—Following plan was examined by T.C. and passed: Theatre in Ainsworth's-yard.—The T.C. approved plans for a Catholic mission hall at Kells.

Woking.—Inquiry has been held by M.H. into application of U.D.C. for swimming and bathing facilities in the Woking district. Council are applying for £1,550 for purchase of land in Chobham-rd., for the purpose.

Worksop.—H. Brakspear, F.S.A., has the work in hand for the restoration of the Priory Church. The scheme comprises the rebuilding of the south transept. Funds are being raised to provide a new £5,000 parochial hall for St. Annes.

Science School, Clifton, Bristol.

With regard to this work, illustrated in our last issue, we are informed that the maple and pitch-pine block floors were executed by Messrs. Turpin's Parquet Floor, Joinery and Woodcarving Company, under contract for Messrs. Henry Willcock & Co., Ltd., building contractors, and the architect, Mr. Alan E. Munby, F.R.I.B.A.

THE SCOTTISH BUILDER

INCORPORATION OF ARCHITECTS IN SCOTLAND

The monthly meeting of the Council of the Incorporation of Architects in Scotland was held at the chambers of the Incorporation at 15, Rutland-square, Edinburgh, when Mr. G. P. K. Young, F.R.I.B.A., Perth, presided over a large attendance of representatives from the five Chapters throughout Scotland. Three associates and two students were elected to membership of the Incorporation. Standing Committees for the ensuing year were also elected, and matters of a technical nature discussed and arranged. Acknowledgment was made of the receipt of a handsomely bound memorial catalogue of the Centenary Exhibition of the R.S.A., the edition being limited to 200 copies. The President entertained the members of Council to luncheon prior to the meeting, and referred to the good effected to the profession generally through the bequest of chambers and funds by the late Sir Rowand Anderson. He further expressed the hope that all architects and students in Scotland would avail themselves of the privilege of membership.

NEW BUILDINGS IN SCOTLAND

Glasgow.—Houses.—The Corporation has approved a lay-out plan of the area of the ground at Scotstoun, west of Balmoral-street, showing 30 houses to the acre. The Corporation also has approved an application from Rosslyn Mitchell and Tullis Cochran for a site in Carntyre, Cumbennauld-road, for the purpose of erecting a picture-house. A plan prepared by the Director of Housing, showing two blocks of two houses each, proposed to be erected in Kelvindals, has been approved.

Edinburgh.—Houses.—The Town Council has considered tenders for the erection of 388 houses at Saughton, and accepted a tender amounting to about £134,500.

Greenock.—Improvements.—The Greenock Harbour Trust are considering a proposal for the widening of Albert Harbour.

Rutherglen.—Houses.—The Dean of Guild Court has approved the application of the Town Council for the erection of 11 tenements, to be erected on the Garrowflat site. The total cost for the work will be £36,228.

Edinburgh. — School. — The Education Authority have approved of a recommendation of the Committee on Health and Physical Instruction that a special school should be erected in the west side of the city for mentally defective children.

Aberdeen. — Extension. — The Aberdeen University Court has recently accepted tenders for the work in connection with the extension of the buildings at King's College, which is estimated to cost £31,000. The work will include the erection of a new lecture hall and an examination hall.

Aberdeen.—Houses.—The Aberdeen District Committee are to erect 38 houses on various sites. Sixteen are to be built at Cults and 12 at Mugiemoss-road, Bucksburn. On the Greenburn-road site the committee are to erect ten wooden houses.

Dundee.—Buildings.—Plans and sections of proposed new buildings, etc., have been lodged at the Office of the City Engineer:—Beck-street garages for Mr. J. Billes; architect, Mr. Nelson T. Stewart, 64, Reform-street. Dundee-road, alterations for Dundee Education Authority. Rosebank-street, garages for Messrs. Low Bros. and Co.

Glasgow.—Schools.—Plans submitted by the Education Authority for the erection of two infant schools, one at Shawlands Academy and the other at Drumoyne, Govan—have been approved by the Dean of Guild Court. Applications were also granted to the Corporation Electricity Department for the erection of electricity sub-stations at Cathcart-road and Miller-street, Shawlands.

Dundee.—Houses.—The Housing Committee of Dundee Town Council has agreed that, in addition to 500 new houses already sanctioned, 116 tenement houses should be built on sites in Byron-street, Arklay-street, and Corso-street.

Glasgow.—School.—The Governors of the West of Scotland Agricultural College have decided that all the activities of the institution, including the Dairy School and experimental farm which are at present located at Kilmarnock, be concentrated upon a rural site near Glasgow.

Falkirk.—Hall.—The Dean of Guild Court has approved the erection of a suite of halls at the corner of Brown-street and Mansion House-road, Camelon, for the Parish Church. The hall will have accommodation for 500 people, and the approximate cost is £3,050.

Jedburgh.—Houses.—The Town Council has received the Clerk's report that the estimated sum required to be borrowed in connection with the third instalment of the local housing scheme, which comprises the erection of 28 houses on the Friars Mount site, will amount to £11,500. Arrangements are also being made for securing the second instalment, amounting to £1,735, in connection with the Jedwater bridges reconstruction scheme.

Inverness.—Housing.—The Town Council has resolved to proceed with the erection of 60 three-apartment brick houses, each costing £397. It was agreed to remit to the Housing Committee to consider whether another 40 houses should be built, under the slum clearance scheme.

Musselburgh.—Housing.—The Town Council has instructed the Burgh Surveyor to secure plans and estimates for the erection on a feu from the Earl of Wemyss at Monktonhall of 52 houses.

Troon.—Houses.—The Dean of Guild Court has passed plans for the erection by the local authority of 104 houses in Logan-drive and Muirhead-crescent, at an estimated cost of £35,702.

BUILDING TRADE WAGES IN SCOTLAND.*
